Energy Research Abstracts

Abstracts 29613-33112

Office of Scientific & Technical Information
UNITED STATES DEPARTMENT OF ENERGY

CURRENT AWARENESS PUBLICATIONS ON ENERGY

To provide complete coverage of literature related to major Department programs, announcement publications that are comprehensive in their coverage of certain energy fields are issued regularly. All information in these publications, plus additional backup information, is included in the Energy Data Base of the Office of Scientific and Technical Information; all references are also available for machine searching via the on-line retrieval system, DOE/RECON, and the commercial on-line retrieval systems. Descriptions of these current awareness publications, which are supported either directly or indirectly by the DOE, appear below. Department of Energy components may receive the listed publications free from the Office of Scientific and Technical Information, U. S. Department of Energy, P. O. Box 62, Oak Ridge, TN 37831. Telephone (615) 576-1301; FTS 626-1301.

PUBLICATIONS OF THE OFFICE OF SCIENTIFIC AND TECHNICAL INFORMATION

Energy Abstracts for Policy Analysis (EAPA)
A monthly abstract journal devoted to the analysis of energy research, conservation, and policy. Scope and coverage are limited to substantive articles or reports and emphasize legislative, regulatory, and other legal aspects, as well as social, economic, and environmental impacts. *EAPA* is available from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The annual subscription price is $72.00 for domestic (North America) or $90.00 for foreign (outside North America) subscribers; a single issue is $5.00 or $6.25, respectively.

Energy Research Abstracts (ERA)
A comprehensive semimonthly abstract journal devoted to all areas of energy-related information produced by the Department of Energy, other U. S. government organizations, and foreign governments. *ERA* is available from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The annual subscription price for the 24 issues is $146.00 for domestic (North America) subscribers or $182.50 for foreign (outside North America) subscribers. A single issue is $14.00 or $17.50, respectively.

DOE Patents Available for Licensing (PAL)
DOE is prepared to grant exclusive or nonexclusive, revocable licenses under DOE-owned U. S. patents and patent applications; this semiannual publication provides abstracting and indexing coverage of this literature. *PAL* is available on subscription (use PB85-946800) from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. The annual subscription price is $14.00 for domestic (North America) or $28.00 for foreign (outside North America); a single issue is $8.00 or $16.00, respectively.

Energy Meetings (EM)
A monthly listing of conferences, symposia, workshops, etc., pertaining to DOE's programmatic interests. *EM* is available on subscription (use PB85-901500) from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. The annual subscription price is $40.00 for domestic subscribers and $80.00 for subscribers outside the North American continent; a single issue is $5.00 and $10.00, respectively.

The following monthly update journals are available to the public on subscription from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161; use the identifying order number (PB- No.) when subscribing. The annual subscription price (12 issues plus cumulative index) is $75.00 for domestic (North America) and $150.00 for foreign (outside North America) subscribers; a single issue is $7.00 and $14.00, respectively.

***Current Energy Patents (CEP)*–PB85-902800**
Devoted to international patent literature, including patent applications, on any aspect of energy production, conservation, and utilization.

***Energy and the Environment (EAE)*–PB85-914900**
Devoted to information on the impacts of energy-related activities and radioactive and nonradioactive pollutants on the environment.

***Fossil Energy Update (FEU)*–PB85-914600**
Devoted to information on the exploration, development, processing, and use of fossil fuels.

***Fusion Energy Update (CFU)*–PB85-915300**
Devoted to information on controlled thermonuclear fusion, including plasma and fuel research and power plant engineering and conceptual design studies.

***Solar Energy Update (SEU)*–PB85-914500**
Devoted to information on the utilization of solar energy, including biomass and tidal and wind power.

The following semimonthly bulletins are also available from the National Technical Information Service. The annual subscription rate for one volume (calendar) year (24 issues; no indexes) is $40.00 for domestic (North America) and $80.00 for foreign (outside North America) subscribers; use the identifying order number (PB- No.) when subscribing.

***Acid Precipitation (APC)*–PB85-901000**
Covers all aspects of acid precipitation, including effects and possible control measures.

***Buildings Energy Conservation (BEC)*–PB85-900700**
Covers worldwide information on the technology required for energy conservation in buildings of all types.

***Coal-Based Synfuels (CBS)*–PB85-901400**
Covers all aspects of conversion of coal into gaseous or liquid fuels.

***Coal Preparation and Pollution Control (CPC)*–PB85-900800**
Covers all aspects of coal preparation and cleaning and reducing pollution from its direct combustion.

***Direct Energy Conversion (DEC)*–PB85-946600**
Covers the following areas: photovoltaics, magnetohydrodynamics, electrohydrodynamics, thermoelectrics, thermionics, and fuel cells.

***Energy from Biomass (EFB)*–PB85-900600**
Covers worldwide information on all aspects of biomass production, conversion, and utilization for energy.

***Geothermal Energy Technology (GET)*–PB85-914700**
Covers information on the exploration, development, and utilization of geothermal resources.

***Heavy-Ion Reactions (HIR)*– PB85-900500**
Covers all aspects of heavy-ion (A > 4) reactions.

***Laser Research (LAR)*–PB85-901100**
Covers all aspects of laser research and development, but excludes applications.

***Nuclear Fuel Cycle (NFC)*–PB85-913400**
Covers all aspects of the nuclear fuel cycle, both front end and back end.

***Nuclear Reactor Safety (NRS)*–PB85-913500**
Covers the safety aspects of accident analysis, safety systems, radiation protection, decommissioning and dismantling, and security measures.

***Radioactive Waste Management (RWM)*–PB85-902900**
Covers the management aspects of transport and storage, waste processing, waste disposal, waste storage, radioactive effluents, and shipping containers.

***Solar Thermal Energy Technology (STT)*–PB85-901200**
Covers research in materials, concentrators/receivers, salinity gradients, etc., for development of efficient and reliable solar thermal conversion systems.

***Unconventional Petroleum (UCP)*–PB85-901300**
Covers all aspects of secondary and tertiary recovery of petroleum and of oil shales and tar sands.

INTERNATIONAL ENERGY PUBLICATIONS

The Office of Scientific and Technical Information (OSTI) cooperates in the publication of international abstract journals with the following: (1) International Atomic Energy Agency, International Nuclear Information System, Vienna, Austria, for *Atomindex;* (2) International Energy Agency, Biomass Conversion Technical Information Service, Dublin, Ireland, for *Biomass Abstracts;* and (3) International Energy Agency, IEA Coal Research, London, England, for *Coal Abstracts.* In each case, the cognizant foreign agency provides the non-U. S. information to OSTI for inclusion in the Energy Data Base; in turn, OSTI provides the U. S. information for input into the respective journal.

Atomindex
A semimonthly abstract journal providing worldwide coverage of information on nuclear science and technology. *Atomindex* is available by subscription from UNIPUB, 345 Park Avenue South, New York, NY 10010. The cost of an annual subscription, 24 semimonthly issues and semiannual and annual cumulative indexes, is $290.

Biomass Abstracts
A bimonthly abstract journal with comprehensive coverage of information in any step involved in the eventual conversion of biomass to energy. *Biomass Abstracts* is available free to Department of Energy components and contractors from OSTI. Non-DOE organizations may obtain *Biomass Abstracts* from Biomass Conversion Technical Information Service, Institute for Industrial Research and Standards, Ballymun Road, Dublin 9, Ireland, for 42 IR pounds per year. Make checks payable to the Institute.

Coal Abstracts
A monthly abstract journal providing comprehensive worldwide coverage of information in the field of coal science and technology. *Coal Abstracts* is available to Department of Energy components and contractors from OSTI. Non-DOE organizations may obtain *Coal Abstracts* from IEA Coal Research, Technical Information Service, 14-15 Lower Grosvenor Place, London SW1W 0EX, England, for 100 pounds sterling per year.

ENERGY RESEARCH ABSTRACTS

ABOUT THE OFFICE OF SCIENTIFIC AND TECHNICAL INFORMATION

The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, has been the national center for scientific and technical information for the Department of Energy (DOE) and its predecessor agencies since 1946. In developing and managing DOE's technical information program, OSTI places under bibliographic control not only DOE-originated information but also worldwide literature on scientific and technical advances in the energy field and announces the source and availability of this information. Whereas the literature of science is emphasized, coverage is extended to DOE programmatic, socioeconomic, environmental, legislative/regulatory, energy analysis, and policy-related areas. To accomplish this mission, OSTI builds and maintains computerized energy-information data bases and disseminates this information via computerized retrieval systems and announcement publications such as abstracting journals, bibliographies, and update journals. Direct access to OSTI's most comprehensive data base, the Energy Data Base, is available to the public through commercial on-line bibliographic retrieval systems. The Energy Data Base and many of OSTI's energy-related data bases are available to DOE offices and contractors and to other government agencies via DOE/RECON, the Department's on-line information retrieval system. The Office of Scientific and Technical Information has developed and maintains systems to record and communicate energy-related research-in-progress information, to maintain a register of DOE public communications publications, to track research report deliverables from DOE contractors, and to test and make available DOE-funded computer software programs with scientific and management applications; OSTI also serves as adviser for special publication needs of the Department. To effectively manage DOE's technical information resources, OSTI's program is one of continual development and evaluation of new information products, systems, and technologies.

ABOUT *ENERGY RESEARCH ABSTRACTS*

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports, journal articles, conference papers and proceedings, books, patents, theses, and monographs originated by the U. S. Department of Energy, its laboratories, energy centers and contractors. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations. The user should remain aware that *ERA* coverage of non-report literature is limited to that generated by Department of Energy activity.

ERA is comprehensive in its subject scope, encompassing the DOE's research, development, demonstration, and technological programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

ERA is available on an exchange basis to universities, research institutions, industrial firms, and publishers of scientific information. Inquiries should be directed to the Office of Scientific and Technical Information, P. O. Box 62, Oak Ridge, TN 37831.

ERA is available to the public on a subscription basis from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The subscription rate for the 24 semimonthly issues is $146.00 for domestic subscribers and $182.50 for foreign subscribers. A single issue costs $14.00 (domestic) or $17.50 (foreign). The cumulative indexes will be available in printed form from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The GPO Stock Number is 061-000-00657-5 and the price is $83.00 for the Vol. 9 indexes. The cumulative indexes are also available in microfiche form from the National Technical Information Service, U. S. Department of Commerce, Springfield, VA 22161, and from Engineered Systems, P. O. Box 866, Oak Ridge, TN 37831.

HOW TO USE *ENERGY RESEARCH ABSTRACTS*

ABSTRACTS IN *ENERGY RESEARCH ABSTRACTS*

The principal elements of abstract entries for a typical research and development report and a typical technical journal article are illustrated below.

Report number — Author(s) — Date of publication — Title — Corporate author — Availability

5785 **(BMI/ONWI-522)** **Thermal property and density measurements of samples taken from drilling cores from potential geologic media.** Lagedrost, J.F.; Capps, W. (Fiber Materials, Inc., Biddeford, ME (USA)). Dec. 1983. 179p. NTIS, PC A06/MF A01; 1; File Number DE84004926. GPO Dep.

Illegibility Code

Abstract

Density, steady-state conductivity, enthalpy, specific heat, heat capacity, thermal diffusivity and linear thermal expansion were measured on 59 materials from core drill samples of several geologic media, including rock salt, basalt, and other associated rocks from 7 potential sites for nuclear waste isolation. The measurements were conducted from or near to room temperature up to 500°C, or to lower temperatures if limited by specimen cracking or fracturing. Ample documentation establishes the reliability of the property measurement methods and the accuracy of the results.

Author(s) — Title — Journal citation — Date of publication

15701 **Equilibrium and power balance constraints on a quasi-static Ohmically heated field-reversed configuration (FRC).** McKenna, K.F.; Rej, D.J.; Tuszewski, M. (Los Alamos National Lab., NM (USA)). *Nuclear Fusion;* **23**: No. 10, 1319-1325 (Oct 1983).

Abstract

Zero-dimensional power balance calculations are performed for a quasi-static, purely Ohmically heated field-reversed configuration. Without compression, the constraint imposed by radial pressure balance limits the power input. Estimates of the energy loss from impurity line radiation as well as from classical and anomalous transport are given. Effects of cold puff gas injection are also investigated.

INDEXES TO *ENERGY RESEARCH ABSTRACTS*

Five indexes are provided for approaching the contents of each issue of *Energy Research Abstracts (ERA)*. Each index is preceded by an introduction that details the organization of the index and the principles by which it was compiled. The reader is referred to these introductions for information not found in the index examples that follow.

• Corporate Author Index

Technical report literature is indexed using the name of the organization or institution responsible for the issuance of the report.

5785 (BMI/ONWI-522) **Thermal property and density measurements of samples taken from drilling cores from potential geologic media.** Lagedrost, J.F.; Capps, W. **(Fiber Materials, Inc., Biddeford, ME (USA)).** Dec. 1983. 179p. NTIS File Number DE84004926. GPO Dep.

is indexed as:

Fiber Materials, Inc., Biddeford, ME (USA)

• Personal Author Index

Each author's name is indexed in the form appearing on the document abstracted, with the exception that given names are reduced to initials:

Capps, W., *See* Lagedrost, J. F.
Lagedrost, J.F., Thermal property and density measurements of samples taken from drilling cores from potential geologic media, 9:5785 (R;US)
McKenna, K.F., Equilibrium and power balance constraints on a quasi-static Ohmically heated field-reversed configuration (FRC), 9:15701 (J;US)
Rej, D.J., *See* McKenna, K.F.
Tuszewski, M., *See* McKenna, K.F.

• Subject Index

The subject index consisting of entries naming specific materials, objects, and processes is arranged alphabetically. Document titles, informative phrases, or both specific to these entries are arranged alphabetically under the entries.

SALT DEPOSITS
  Density
    Thermal property and density measurements of samples taken from drilling cores from potential geologic media, 9:5785 (R;US)
REVERSED-FIELD PINCH
  Energy Balance
    Equilibrium and power balance constraints on a quasi-static Ohmically heated field-reversed configuration (FRC), 9:15701 (J;AT)

• Contract Number Index

DOE technical report literature is indexed using contract numbers. This index contains the contract number with corresponding abstract and report numbers.

AC06-76RL01830 **Fiber Materials, Inc., Biddeford, ME (USA)**
9:5785 BMI/ONWI-522

• Report Number Index

Technical report literature is also indexed using report numbers. This index includes information on where individual reports may be obtained. Patents and conference papers are indexed here as a matter of convenience. When a report is supplied under a File Number, that number is included in the availability statement. A file number–report number correlation is included for convenience.

BMI/ONWI-522	9:5785	NTIS, PC A09/MF A01. File Number DE84004926, Distribution Category MN-70

Communication concerning the editorial policy and content of *Energy Research Abstracts* should be addressed to the Editor, *Energy Research Abstracts,* Office of Scientific and Technical Information, P. O. Box 62, Oak Ridge, TN 37831.

SUBJECT CONTENTS (NUMERICAL LISTING)

Six-digit subject category numbers are used in the storage, retrieval, and manipulation of bibliographic information entered into DOE's computerized bibliographic information system. The six-digit category numbers are utilized as if they were three pairs of two-digit numbers, the first two pairs being used to arrange the abstract content of *Energy Research Abstracts*. The following listing includes the totality of the 39 first-level and 293 second-level subject categories used. Because each issue of *ERA* announces only those documents becoming available during a semimonthly period, some subject categories may not be represented in every issue. The complete subject category scheme with scope definitions and limitations is available as DOE/TIC-4584-R6 from NTIS for $9.50.

SUBJECT CONTENTS (ALPHABETICAL LISTING)

Six-digit subject category numbers are used in the storage, retrieval, and manipulation of bibliographic information entered into DOE's computerized bibliographic information system. The six-digit category numbers are utilized as if they were three pairs of two-digit numbers, the first two pairs being used to arrange the abstract content of *Energy Research Abstracts*. The following listing includes the totality of the 39 first-level and 293 second-level subject categories used. Because each issue of *ERA* announces only those documents becoming available during a semimonthly period, some subject categories may not be represented in every issue. The complete subject category scheme with scope definitions and limitations is available as DOE/TIC-4584-R6 from NTIS for $9.50.

ENERGY RESEARCH ABSTRACTS

01 COAL AND COAL PRODUCTS

REFER ALSO TO CITATION(S) 29694, 31151

29613 (DOE/METC—84-23, pp 13-22) **US fossil program - an overview.** Adams, M.R. (Dept. of Energy, Washington, DC). Jun 1984. NTIS, PC A99/MF A01. File Number DE84009251. (CONF-8010382—).

From Morocco/United States oil shale colloquium; Rabat, Morocco (1 Oct 1980).

An overview of the US fossil fuel program is presented. The energy objectives for the US as well as the research and development activities necessary to meet these objectives are discussed.

29614 **(IS-EMRRI—20) [Mining and mineral-related research]. Final report, October 1, 1982-September 30, 1983.** (Iowa State Univ. of Science and Technology, Ames (USA). Iowa State Mining and Mineral Resources Research Inst.). Dec 1983. Contract W-7405-ENG-82. 80p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85011355.

An industrial process was developed to recover iron ore from discarded power plant fly ash based on magnetic separation and caustic leachings. An electrowinning method was developed for copper using a fluidized bed electrochemical reactor. A method was improved to test rock strength in underground mine workings. A patentable safety device was developed to test directly shear components on the inside walls of underground mines using pulse velocity measurement of induced fractures. The thermal behavior of minerals commonly associated with US coals was studied kinetically using heating-stage microscopy. A mathematical model was formulated to monitor and predict the transport of fugitive dust from a surface mine environment.

29615 **(IS-EMRRI—21) [Mining and mineral-related research.] Final report, July 1, 1983-June 30, 1984.** (Iowa State Univ. of Science and Technology, Ames (USA). Iowa State Mining and Mineral Resources Research Inst.). Sep 1984. Contract W-7405-ENG-82. 98p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85011354.

Significant research was conducted in mining and mineral related disciplines. The Institute has: continued investigating recovery of platinum group metals from spent catalysts; developed a method of rapid dissolution to analyze coal and minerals; initiated the characterization of iron sulfides and silicates in a mafic silicate melt; identified an improved refractory and its properties for coal gasifiers; identified improved mechanical properties of refractories for coal gasifiers; continued the development of a process to desulfurize gypsum in a fluidized bed reactor system in order to produce lime and sulfur dioxide for industrial use; developed a technique to utilize coal-derived fly ash in combination with mining wastes for use both in reclamation or surface-mined land and in the construction industry; continued to assess the properties of limestones for use as sorbents in fluidized bed combustion; continued development of an industrial process to recover minerals from coal-fired power plant fly ash; improved the application of a practical in-situ strength test to enhance the safety of underground mine workings; and continued research to determine the effect of nitrogen-fixing growth on restored spoil banks.

29616 **(ORNL—6162) Fossil Energy Program. Quarterly progress report for the period ending March 31, 1985.** (Oak Ridge National Lab., TN (USA)). May 1985. Contract AC05-84OR21400. 133p. NTIS, PC A07/MF A01; GPO Dep. File Number DE85013531.

This report covers progress made during the period January 1 through March 31, 1985, for research and development projects that contribute to the advancement of various fossil energy technologies. Projects on the Fossil Energy Program are supported by DOE Office of Fossil Energy, DOE Office of Basic Energy Sciences, the Electric Power Research Institute, and the Tennessee Valley Authority. The Fossil Energy Program organization chart is shown in Appendix A. Summaries and progress reports are presented for the following tasks: (1) materials research and development; (2) fossil energy environmental programs; (3) coal conversion development; (4) process analysis and development; (5) generalized equilibrium models of liquid and gaseous fuel supply; (6) fluidized bed combustion joint program; and (7) coal chemistry.

29617 **(BNL—36367) Flash hydropyrolysis and methanolysis of coal with hydrogen and methane.** Steinberg, M. (Brookhaven National Lab., Upton, NY (USA)). Apr 1985. Contract AC02-76CH00016. 30p. (CONF-850512—1). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85013290.

From Beijing international symposium on hydrogen systems; Beijing, China (7 May 1985).

The process of flash pyrolysis consists of rapidly heating a carbonaceous material to elevated temperatures ($\geqq 10^{4}$°C/sec usually to temperatures above 700°C) with either a reactive or nonreactive gas, allowing reaction to take place at elevated temperature for short periods of time ($\leqq$ 10 sec) and quickly cooling ($\geqq 10^{2}$°C/sec) the reaction system to terminate the reaction. The carbonaceous material is depolymerized into short chain and smaller light molecules which can, at the elevated temperature, react with each other or react with the pyrolyzing gas, and upon fast cooling, the lighter products are stabilized preventing repolymerization and char formation. When hydrogen is used as the pyrolyzing gas, the process is referred to as flash hydropyrolysis (FHP). When methane is used, the reaction is referred to as flash methanolysis (FM). The process can also be extended to steam, which is then referred to as flash hydrolysis. 21 refs., 17 figs., 2 tabs.

29618 **(DOE/ER/10488—T1) Gasification of disordered carbons (chars). Final report.** Jenkins, R.G. (Pennsylvania State Univ., University Park (USA)). Dec 1984. Contract AC02-79ER10488. 12p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85005880.

A series of complementary, fundamental studies has been made on the topic of the carbon-oxygen reaction. An examination has been made into the quantification and activity of carbon active sites and the role they play in determining the gasification rates of a range of carbons. The carbons included a spectroscopically pure graphite, a polymer-derived isotropic char and a graphitized carbon black. Reaction kinetics of the carbon-oxygen reaction were made over a wide range of oxygen pressures 5 Pa-6.4 MPa. Temperatures were in the range of 733 K-973 K. Evidence has been found that even for high purity carbons there is a nontrivial influence of minute quantities of inorganic impurities in terms of gasification and the production of carbon dioxide. It was found that the presence of added Pt (~ 1% wt) on to a graphitized carbon black increases gasification reactivity by about 200-fold. The Pt catalyzed reaction was found to be zero order and have an activation energy of 220 kJ/mole. From mechanistic studies, it was concluded that extremely small (1-2 nm), Pt particles in contact with the carbon active sites are the dominating catalytically active particles. The dispersion of these small particles does not change appreciably with carbon burn-off.

29619 (DOE/MC/20417—1825) Novel sorbents for high temperature regenerative H_2S removal. Quarterly report No. 4, November 1984-January 1985. Flytzani-Stephanopoulos, M.; Gavalas, G.R.; Sharma, P.K. (Jet Propulsion Lab., Pasadena, CA (USA)). Mar 1985. Contract AI21-83MC20417. 30p. (JPL/D—2274). NTIS, PC A03/MF A01; GPO Dep. File Number DE85009891.

The overall objective of this program is to develop improved regenerable sorbents for the high-temperature desulfurization of coal-derived gas streams. The aim is to reduce the H_2S level, preferably in a single stage, from a few percent down to 1 ppM. The specific objectives of this project are to synthesize, characterize and test two classes of sorbents. One consists of eutectic mixtures of metal oxides (e.g., $ZnO-V_2O_5$, $CuMoO_4-MoO_3$) in the form of a melt coating the pore surface of a high surface area solid support. The second class of sorbents includes unsupported mixed oxides, in the form of solid solutions or solid compounds, e.g., Zn-Fe/sub x/-O/sub y/, Cu-Fe/sub x/-O/sub y/, prepared as highly dispersed microcrystalline solids. The principal characteristics of both classes of sorbents are rapid kinetics of absorption, high absorption capacity and good regenerability. During this reporting period, parametric studies of sulfidation/regeneration with the mixed oxide sorbents CFA (Cu-Fe-Al-O) and CM (Cu-Mo-Al-O) both prepared in porous, microcrystalline form were performed. These two types of sorbents were identified in our previous work as very efficient, high performance materials for single-stage H_2S removal at temperatures higher than 600°C. Experimental procedures and results are discussed. 15 refs., 4 figs., 4 tabs.

29620 (DOE/MC/21377—T1) ASPEN sensitivity study for the Great Plains Gasification Plant. Technical progress report, May 1-31, 1985. Cascone, R.F.; Farrell, R.J. (Scientific Design Co., Inc., New York (USA)). 13 Jun 1985. Contract AC21-84MC21377. 98p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85013357.

During the period 5/1/85 through 5/31/85 work was performed on the following tasks: Task No. 1-2 Methanation Model; and Task No. 1-3 Rectisol Model. The first task in providing a rating model of the Methanation Section was to develop a reaction kinetic expression that can be used in ASPEN. It is intended to insert this expression in a separate user subroutine that will be called by the RPLUG reactor model of ASPEN. RPLUG will be used in place of RGIBBS, which is used in the present flowsheet model of the Methanation Section. Based on the recommendations contained in the final topical report for the Rectisol Plant (February 1985), work was begun on: (1) attempting to merge the simulation of the Main Sequence and the Methanol Recovery Sequence; and (2) verification of the major assumptions made in preparing these simulations by reviewing the Rectisol Plant PMX diagrams.

29621 (DOE/PC/30209—T13) Solvent tailoring in coal liquefaction based on critical properties of physical solvating agents and hydrogen donors. Progress report, August 1980-January 1981. Williams, D.C.; Guin, J.A.; Curtis, C.W. (Auburn Univ., AL (USA). Coal Conversion Lab.). 1981. Contract FG22-80PC30209. 18p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012855.

As an initial study of the role of solvation in liquefaction mechanisms, two basic types of solvents, aliphatics and aromatics, were examined. That is synergetic effects between these types of compounds and a hydrogen donor on coal solvation were studied. Tetralin, which is known to be an effective hydrogen donor, was used here as the hydrogen donor. The aliphatics examined were observed to have an adverse effect on conversion, which was assumed to be related to their poor solubility for the liquefaction products. The synergetic effects of several aromatics having different number of condensed rings in binary mixture with tetralin on conversion were also evaluated. Low conversions resulted when the reaction mixture contained highly volatile aromatics like benzene mixed with tetralin and a 1:1 tetralin-to-coal (T/C) ratio. These low conversions were also assumed to result because of poor solution/dispersion of liquefaction products. Highly volatile compounds like benzene exist mostly in the vapor, or fluid, phase at liquefaction temperature, and their solvation or extraction power varies with their density. Under the conditions used in this work, the density of the benzene could have been too low to allow proper extraction of products and reduce related mass transfer effects. The effect of varying the solvent-to-reactor-free volume ratio on conversion in the presence of compounds like benzene is yet to be evaluated. This is to be done in an hydrogen atmosphere as well as in an inert atmosphere. Details of the experimental methods and results are presented. 29 refs., 6 figs., 6 tabs.

29622 (DOE/PC/30236—T2) Mechanisms of fatigue in coal liquefaction environments. Progress report. Gross, T.S. (Kentucky Univ., Lexington (USA)). 1 Apr 1983. Contract FG22-80PC30236. 25p. NTIS MF A01; 2; GPO Dep. File Number DE85008527.

The second major thrust of Mr. Kanga's research was the development of an electrical resistance fatigue crack initiation gage capable of withstanding corrosion from coal liquefaction environments. His efforts were unsuccessful. First, an Al_2O_3-Al-Al_2O_3 sandwich type gage with the Al layer as the conducting path was investigated. Second, a commercial corrosion resistant coating, Aremco 567, was evaluated. We will attempt to construct a crack initiation gage. The most promising approach would be to directly sputter Al_2O_3 on to the metal substrate. The objective of the present investigation is to carry out low-cycle fatigue experiments on 316 stainless steel under simulated liquefaction environments and to evaluate the effects of such environments on the modes and mechanisms of fatigue failure. The activities during this report period concentrated on: (1) further studies on the effects of environment on fatigue crack initiation and propagation in 316 stainless steel subjected to rotating bending fatigue at room temperature; and (2) development of a suitable technique for the measurement of fatigue crack growth during axial loading in simulated coal liquefaction environments. The progress since our last report consists mainly of the preparation, submittance and examination of the Master's thesis of Mr. Percy Kanga, the student employed by this contract. His research effort had two thrusts, the first of which was to investigate the room temperature crack initiation behavior of 2-1/4 Cr-1 Mo pressure vessel steel and 316L stainless steel. The criteria chosen to evaluate crack initiation was to measure the number of cycles to produce a 0.100" crack at a sharp notch. The results of the measurement of the two steels show that the two steels have very close to the same crack initiation resistance. The threshold for crack initiation is the same for both metals.

29623 (DOE/PC/40009—T8) Advanced coal liquefaction catalyst development. Quarterly progress report No. 9, October 1-December 31, 1983. Mahoney, J.A.; Schwartz, M.M.; Wittrig, T.S. (Amoco Research Center, Naperville, IL (USA)). Sep 1984. Contract AC22-81PC40009. 38p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012307.

The objective of this program is to identify advanced coal liquefaction catalyst and operating conditions for use in optimized, two-stage direct coal liquefaction process applications and to experimentally test catalysts in a two-stage reaction system for supporting the improvement of this process. A development plan consisting of eight project tasks has been formulated and is summarized as follows: Task 1 - project work plan; Task 2 - literature survey; Task 3 - feed materials specification; Task 4 - continuous aging unit modification; Task 5 - thermal reaction process variable study; Task 6 - two-stage optimization; Task 7 - project coodination; and Task 8 - ebullated bed testing. This report summarizes progress in tasks 5 and 6 during the last quarter. Some of the conclusions are as follows: (1) Two-stage liquefaction of Illinois No. 6 coal with a high-severity first stage dissolver and low space velocity hydrotreater offers substantial advantages over one-stage liquefaction on Amoco's continuous coal liquefaction pilot plant. Improvements are observed for solubility conversions, resid conversion and heteroatom removal. (2) The performance of the unit in high-severity first stage configuration does not degrade over the seven day period of the experiment. This indicates that the catalyst is not deactivating over that period. (3) Operation of the dissolver at low severity produces results that are not significantly better (and in some cases, worse) than one-stage processing. (4) Preliminary data indicate that two-stage liquefaction of Wyodak coal also will be advantageous compared to one-stage processing. 2 refs., 13 figs.

29624 (DOE/PC/40091—T15) Development of significantly improved catalysts for coal liquefaction and upgrading of coal extracts. Final report, September 28, 1981-February 28, 1985. Sinha, V.T.; Kutzenco, P.D.; Preston, W.J.; Ungar, J.K.; Brinen, J.S.; Muchnick, T.L.; Hyman, D. (American Cyanamid Co., Stamford, CT. Chemical Research Div.). 1985. Contract AC22-81PC40091. 453p. NTIS, PC A20/MF A01; 1; GPO Dep. File Number DE85013583.

New beaded catalysts for direct liquefaction of coal and for upgrading of coal-derived resids were studied during the period of September 1981 through February 1985. Catalysts prepared on rehydratable alumina supports were screened for initial activity in a batch autoclave test. Samples with unimodal and bimodal pore size distributions were included. They contained various levels of MoO_3 and promoters such as NiO and CoO. Leads from initial activity tests were pursued in catalyst aging runs in a continuous flow unit. Aging trials were carried out with Illinois No. 6 coal, Wyodak coal, and Wilsonville thermal deashed resid as feeds. Different catalysts with improved activity vis-a-vis baselines were identified for each of the feeds. Results strongly indicate that optimization of catalyst performance is feed dependent. The cold-flow ebullation characteristics of bead catalysts were also studied. Sizes and size ranges equivalent in behavior to 1/16 inch and 1/32 inch extrudates, used in ebullated bed reactors, were determined. Two empirical models correlating three-phase fluidized bed expansion with operating variables were developed. Additionally, techniques to study organic and inorganic constituents of catalyst surfaces were explored. These included ESCA, electron microprobe, and Auger spectroscopy. 44 refs., 16 figs., 26 tabs.

29625 (DOE/PC/40778—T4) Optimization of various coal conversion systems. Final report. Whiting, W.B.; Hano, T.; Pattipati, R.R.; Tong, T.M. (West Virginia Univ., Morgantown (USA). Dept. of Chemical Engineering). 1984. Contract FG22-81PC40778. 122p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85012500.

Computer simulations of two coal-liquefaction processes are presented. For the SCR-II preheater/transfer-line/reactor system, a finite-difference dynamic simulation was developed and found to give qualitative agreement with pilot-plant startup data. A sensitivity analysis on physicochemical and model parameters with this dynamic simulator indicates areas in which future work will be most profitable. A steady-state simulation for the H-coal process flowsheet shows good agreement with pilot-plant data when some model parameters are adjusted to these data. All computer programs are in ANSI FORTRAN (1966) and are included in this report. Two general kinetic models (a 6-path and a 9-path model) for coal liquefaction have been developed. Rate constants (including temperature dependence and catalytic effects) for both of these models have been determined for the available kinetic data. 15 refs., 10 figs., 2 tabs.

29626 (DOE/PC/40786—6) Heterogeneous kinetics of coal gasification. Quarterly technical progress report, 1 October 1982-31 December 1982. Calo, J.M.; Ellison, S.E. (Brown Univ., Providence, RI (USA). Div. of Engineering). Jan 1983. Contract FG22-81PC40786. 32p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85013001.

In the current quarterly technical progress report we present accomplishments and results in four areas: (1) progress made on the automated data acquisition system; (2) transient CO_2 gasification data obtained for Darco lignite char (PSOC No. 623) [These data represent the first obtained with the automated mass programming and data acquisition system developed for this project. From this data it is concluded that the apparent decrease in the "effective" active site concentration with increasing temperature, observed in our previous data, appears to be largely irreversible.]; (3) the final version of the transient steam addition to be used for steam gasification studies; and (4) consideration of the possibility of multiple steady-states for steam gasification in a well-mixed reaction system. From this analysis it is concluded that the occurrence of this phenomenon for this system is unlikely. 3 refs., 16 figs., 1 tab.

29627 (DOE/PC/40786—7) Heterogeneous kinetics of coal gasification. Quarterly technical progress report, 1 January 1983-31 March 1983. Ellison, S.E.; Calo, J.M. (Brown Univ., Providence, RI (USA). Div. of Engineering). Jan 1983. Contract FG22-81PC40786. 87p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85013000.

The current quarterly technical progress report focuses on the results of a study conducted on multiparameter estimation schemes for determining the parameters in the various char gasification kinetic models that are applied to the transient kinetic data. The work reported herein is primarily that of Mr. S.E. Ellison, and has also been submitted as his Sc.B. thesis at Brown University. 26 refs., 6 figs., 2 tabs.

29628 (DOE/PC/40792—T7) Studies of initial reaction steps in the gasification of coal and selected model compounds. Final technical report, September 1981-August 1983. Chu, C.J.; Fredin, L.; Badachhape, R.B.; Hauge, R.H.; Margrave, J.L. (Rice Univ., Houston, TX (USA). Dept. of Chemistry). 1983. Contract FG22-81PC40792. 97p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85013003.

The objective of this work is to study the chemistry and reaction mechanism of species resulting from the pyrolysis of coal particles. Emphasis is placed on clarifying and understanding coal chemistry during the early initial steps of coal gasification where highly reactive gas phase intermediate species can be observed by rapidly bringing the coal to reaction temperature. The experiments are designed such that reactive gas phase intermediates can leave the reaction zone without wall collisions and be trapped with an inert gas on a cold (12°K) matrix surface. Identification and characterization of these gaseous species and possibly free radicals are performed in a newly designed matrix isolation system coupled to a high resolution Fourier Transform I.R. Variables such as temperature, coal particle size, heating technique, tar formation, and addition of isotopically enriched reactant species were studied. Structural data of coal from fluorocoal and polycyclic aromatic model compounds were also pursued. 23 refs., 48 figs.

29629 (DOE/PC/50033—T3) Syn-fuel reciprocating charge pump improvement program. Quarterly report, July 1-September 30, 1984. (Ingersoll-Rand Research, Inc., Princeton, NJ (USA)). 1984. Contract AC22-82PC50033. 8p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013013.

The main effort during the third quarter of 1984 has been to debug the 3V3 pump slurry valves. The valves become stuck as sand packs around them. The valves have been modified and are being reinstalled for testing. The operating procedures for both the test loop and the reciprocating test pump have been finalized. 1 fig.

29630 (DOE/PC/50033—T4) Syn-fuel reciprocating charge pump improvement program. Quarterly report, October 1-December 31, 1984. (Ingersoll-Rand Research, Inc., Princeton, NJ (USA)). 1984. Contract AC22-82PC50033. 14p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85013014.

Two significant accomplishments were achieved in the fourth quarter of 1984. The 3V3 slurry pump valves were successfully modified and now operate correctly. The 200 h accelerated sand-water test of the pump and seals was started and completed. The conventional plunger/packing failed twice during this test while under the same conditions the floating piston seals maintained a positive seal between the slurry and buffer liquids. 6 figs.

29631 (DOE/PC/50053—T5) Feasibility analysis for data base design. (Orkand Corp., Silver Spring, MD (USA)). 31 Jan 1983. Contract AC22-82PC50053. 50p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85004239.

This report summarizes the results of a study conducted for the Department of Energy's Pittsburgh Energy Technology Center (PETC) on the design of a coal liquefaction technology data base (LTDB). The data base was designed to collect and store data generated from the four major government-sponsored coal liquefaction projects, Solvent Refined Coal-I, Solvent Refined Coal-II, H-Coal and EDS. The specific objectives of The Orkand Corporation study were to: review current PETC data collection and processing procedures; assess user data requirements; examine other synthetic fuels data management systems; evalute PETC data dissemination options; and recommend system enhancements. The PETC system has collected and indexed over 10,000 coal liquefaction documents, including technical reports, computer printouts, operational runs, blueprints, engineering drawings, repair records, etc. These materials span a variety of subject categories, including engineering, economic, environmental and management data. At present, PETC has collected over 95 percent of the available nonproprietary data on SRC-II; H-Coal and EDS data collection efforts are expected to be completed by the fall of 1983, with negotiations for the transfer of SRC-I data currently ongoing. PETC uses a five-stage cycle for processing information. This involves: (1) indexing all materials; (2) checking for non-useful data; (3) reviewing documents for completeness; (4) abstracting high quality high/high utility data; and (5) conducting data analysis.

29632 **(DOE/PC/50798—T5) Catalyzed gasification of coal: isotope and XPS studies. Reporting period: February 16, 1985-May 15, 1985.** Falconer, J.L. (Colorado Univ., Boulder (USA)). 16 May 1985. Contract FG22-82PC50798. 4p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011914.

This research aims to elucidate the reaction mechanism for the catalytic gasification of coal by metal carbonates, by identifying the reaction pathways and the active form of the catalyst. The insight into the mechanism will help in improving process kinetics of coal gasification. Alkali carbonates and alkaline earth carbonates are being used to catalyze the carbon dioxide-carbon gasification reaction. Temperature-programmed reaction, isotopic labeling of the carbon and oxygen atoms in the carbonate, and mass spectrometric detection of labeled products are used to identify reaction pathways. X-ray photoelectron spectroscopy (XPS) analysis of carbon-carbonate mixtures is used, at reaction conditions, to determine the chemical state of the carbonate.

29633 **(DOE/PC/50798—T6) Catalyzed gasification of coal: isotope and XPS studies. Reporting period: November 15, 1982-February 14, 1983.** Falconer, J.L. (Colorado Univ., Boulder (USA)). 15 Feb 1983. Contract FG22-82PC50798. 8p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012844.

This research aims to elucidate the reaction mechanism for the catalytic gasification of coal by metal carbonates, by identifying the reaction pathways and the active form of the catalyst. The insight into the mechanism will help in improving process kinetics of coal gasification. Alkali carbonates and alkaline earth carbonates are being used to catalyze the carbon dioxide-carbon gasification reaction. 29634 **(DOE/PC/50799—T7) Enhanced coal liquefaction by hydropyrolysis in supercritical fluids. Quarterly report, October-December 1984.** Paulaitis, M.E.; Klein, M.T.; Stiles, A.B. (Delaware Univ., Newark (USA). Dept. of Chemical Engineering). 1984. Contract FG22-82PC50799. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85010075.

This research program involves a fundamental investigation of a novel coal liquefaction process that combines pyrolysis, supercritical-fluid solvent extraction, and in situ hydrogen generation through catalytic dissociation of methanol. The experimental work consists of determining: (1) coal pyrolysis reaction pathways, kinetics and mechanisms, and the identity and structure of reaction intermediates, (2) solubilities of coal-derived species in supercritical water, methanol, and water + methanol mixtures, and (3) reaction pathways involved in the generation of hydrogen by catalytic dissociation of methanol to carbon monoxide and hydrogen, and through the shift of carbon monoxide. Both model coal compounds and actual coals are to be studied. 2 refs., 6 figs.

29635 **(DOE/PC/60039—5) Phase behavior of coal fluids: data for correlation development. Reporting period: November 1, 1984-April 30, 1985.** Robinson, R.L. Jr.; Anderson, McRay; Barrick, M.; Bufkin, B. (Oklahoma State Univ., Stillwater (USA). School of Chemical Engineering). 1985. Contract FG22-83PC60039. 20p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012001.

The overall objective is to develop accurate predictive methods for representation of vapor-liquid equilibria in systems encountered in coal-conversion processes. The objectives of the present project include: (1) measurements of binary vapor-liquid phase behavior data for selected solute gases (e.g., H_2, CO, CO_2, NH_3, H_2S) in a series of heavy, primarily aromatic, solvents (e.g., benzene, naphthalene, phenanthrene) to permit evaluation of interaction parameters in models for phase behavior. Both solubilities of the gases in the liquid phase and of the heavy solvents in the gas phase will be determined; (2) measurements on ternary systems in which high-melting-point solvents (e.g., pyrene, chrysene, triphenylene) are dissolved in more volatile aromatics to provide mixed solvents; this will facilitate measurements at lower temperatures than would be possible in the pure high-melting-point aromatic solvents, which would be solid at operating conditions; (3) evaluation of existing equations-of-state and other models for representation of phase behavior in systems of the type studied experimentally; development of new correlation frameworks as needed; and (4) generalization of the interaction parameters for the solutes studied to a wide spectrum of heavy solvents; presentation of final results in formats useful in the design/optimization of coal liquefaction processes. During the present report period, our recent data on CO_2 solubilities in naphthenic and aromatic solvents have been analyzed. In addition, a correlation for phase behavior in CO_2 + heavy n-paraffins has been developed and presented at the Houston AIChE meeting. New experimental data have been obtained for CO_2 + n-dodecane at 323.2, 344.3 and 373.2°K and for ethane + trans-Decalin at 323.2 and 373.2°K. 11 refs., 10 figs., 3 tabs.

29636 **(DOE/PC/60813—7) Hydrotreatment catalyst activity enhancement. Quarterly report No. 7, February 1, 1985-April 30, 1985.** Seapan, M.; Crynes, B.L. (Oklahoma State Univ., Stillwater (USA). School of Chemical Engineering). 28 May 1985. Contract FG22-83PC60813. 24p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012302.

The catalyst samples from Tetralin hydrogenation experiments were analyzed. The coking results were statistically inconclusive. Titanium profiles in catalyst pellets showed two maxima, one near the edge and the other at the center of the pellet, indicating that two different precursors were responsible for titanium deposition. The feasibility of ESR spectroscopy to study the role of titanocene dichloride in the free radical mechanisms is being investigated. 4 refs., 13 figs., 6 tabs.

29637 **(DOE/PC/70786—T2) Transition metal catalysis of hydrogen shuttling in coal liquefaction. Quarterly technical progress report, December 1, 1984-February 28, 1985.** Eisch, J.J. (State Univ. of New York, Binghamton (USA). Dept. of Chemistry). 30 Apr 1985. Contract FG22-84PC70786. 4p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011491.

The ultimate objective of this research is to uncover new catalytic processes for the liquefaction of coal and for upgrading coal-derived fuels by removing undesirable organosulfur, organonitrogen, and organooxygen constituents. Basic to both the liquefaction of coal and the purification of coal liquids is the transfer of hydrogen from sources such as dihydrogen, metal hydrides or partially reduced aromatic hydrocarbons, to the extensive aromatic rings in coal itself or to aromatic sulfides, amines, and ethers. Accordingly, this study is exploring how such crucial hydrogen-transfer processes might be catalyzed by soluble, low-valent transition metal complexes under moderate conditions of temperature and pressure. By learning the mechanism whereby H_2, metal hydrides or partially hydrogenated aromatics can transfer hydrogen to model aromatic compounds, under homogeneous transition-metal catalysis, we hope to identify new methods for producing superior fuels from coal. During the second quarter the following aspects were pursued: (1) the appointment of the postdoctoral research associate has been made; (2) the choice and purchase of a high-performance liquid chromatograph (Perkin-Elmer) have been completed; (3) the final data for our manuscript on the desulfurizing action of the bis(1,5-cyclooctadiene)nickel-$LiAlH_4$ combination have been collected; (4) experiments have begun on the nickel-catalyzed hydrogen shuttling reactions of dihydroaromatics, such as 1,4-cyclohexadiene; and (5) surveying the cleavage of carbon-element bonds by the combination of $LiAlH_4$ with 2,2′-bipyridyl(1,5-cyclooctadiene)nickel continues.

29638 (DOE/PC/70811—2) **Improved coal conversion in CO/water systems. Quarterly report No. 2, December 4, 1984-March 3, 1985.** Ross, D.S.; Hum, G.; Miin, T.C. (SRI International, Menlo Park, CA (USA)). Apr 1985. Contract FG22-84PC70811. 11p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013247.

This research program is a study of conversion mechanisms in CO/H_2O systems. We have previously reported the conversion of an Illinois No. 6 coal to toluene-soluble (TS) product at 400°C for 20 minutes. The conversion was found to follow the water-gas-shift reaction (WGSR), $CO + H_2 \rightarrow CO_2 + H_2$. More specifically, the levels of conversion correlated with the degree of CO disappearance. The extent of CO being converted in the WGSR is controlled by the amount of KOH present. Ultimately, the level of conversion was controlled by varying the initial pH of the H_2O solution. The intermediate is believed to be formate, formed by the reaction of CO and KOH. Ross has postulated the mechanism of coal conversion in CO/H_2O systems in a recent review on aqueous conversion. It is suggested that the thermolysis of weak bibenzyl type bonds in coal conversion is not a significant process, but rather that reactions involving phenolic constituents in the coal are more important. We have synthesized a model polymer, polynaphthoquinone (PNQ), and have reduced it to its polyphenolic structure for studying the importance of phenolic functions and its correlation to coal conversion. The research is being performed in two tasks. In the first, we are investigating formate-promoted conversions of Illinois No. 6 coal. In the second, the reactions of the model polymer PNQ are being studied in the CO/H_2O system. Our objectives are to improve conversion effectiveness with formate and to determine the correlation of phenolic functions present in coal structures with conversion. This quarter, we have focused on the synthesis and reduction of PNQ. We are at present designing an appropriate microreactor system for the formate study. 7 refs., 1 fig., 1 tab.

29639 (DOE/PETC/TR—85/8) **Thermal component of residuum conversion in two-stage coal liquefaction.** Stiegel, G.J.; Lett, R.G.; Cillo, D.L.; Mima, J.A.; Tischer, R.E.; Narain, N.K. (USDOE Pittsburgh Energy Technology Center, PA). Jun 1985. 56p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85013005.

An experimental investigation was conducted to ascertain the contribution of thermal reactions to the conversion of residuum in the hydroprocessing reactor of two-stage liquefaction processes. Feedstocks prepared from residuum produced at the Wilsonville Advanced Coal Liquefaction Test Facility (ACLTF) and solvents produced by the catalytic hydrotreatment of solvent obtained from the Wilsonville ACLTF were reacted in the absence of a catalyst at temperatures ranging from 720°F to 850°F. Detailed characterization of the composite feedstock and product samples as well as of three fractions of each obtained by vacuum distillation was performed to ascertain the extent of residuum conversion, heteroatom removal, and hydrogen rearrangement. The results showed that hydrogenation of the solvent portion of the hydrotreater feedstock neither enhances residuum conversion nor results in the transfer of hydrogen to the residuum. Higher reaction temperatures enhanced the removal of sulfur but had little effect on other reactions. The results suggest that the conversion of residuum in the hydroprocessing reactor of two-stage liquefaction processes must occur catalytically rather than thermally. 10 refs., 1 fig., 30 tabs.

29640 (EPRI-AP—4026) **Fate of basic nitrogen solvents in coal liquefaction. Final report.** Taylor, L.T. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA). Dept. of Chemistry). May 1985. 119p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920655.

Certain model nitrogenous donor solvents have been demonstrated to enhance the liquefaction of coals. Unfortunately the yield of distillate product has been disappointingly low and the extent of solvent loss due to degradation and incorporation into coal structures has been relatively high. The overall effectiveness of various carefully chosen model, nitrogen-containing process solvents (1,2,3,4-tetrahydroquinoline, 1-methyl-2,3,4-tetrahydroquinoline, cyclohexenopyridine, 1,2,3,4-tetrahydroisoquinoline, etc.) for the conversion of a western coal to distillate products has been established. For each liquefaction run a nitrogen balance between gas make, light ends, distillables and residuum was obtained. To further delineate and quantify the coal-solvent interaction, nitrogen and mass balance data have been obtained on the products produced from a liquefaction run performed by Kerr McGee. In both series of experiments adduction of process solvent to non-distillate and high boiling distillate materials is significant. Though some breakdown of process solvent was found, its contribution to the loss of the dynamic nitrogen component is minimal in comparison to the problem of adduction to residuum. By application of a number of analytical techniques such as Fourier transform infrared spectrometry, field ionization mass spectrostrometry, gas chromatography and high performance liquid chromatography, the chemical fate of several solvents during liquefaction is described. 17 refs., 47 figs., 13 tabs.

29641 (EPRI-AP—4030) **Integrated two-stage coal liquefaction steady-state performance. The Advanced Coal Liquefaction R and D Facility, Wilsonville, Alabama. Final report.** (Catalytic, Inc., Wilsonville, AL (USA)). May 1985. Contract AC22-82PC50041. 151p. NTIS, PC A08/MF A01; 1 - Research Reports Center, Box 50490, Palo Alto, CA 94303; GPO Dep. File Number DE85012872.

This report presents the operating results for Run 245 at the Advanced Coal Liquefaction R and D Facility in Wilsonville, Alabama. This run was made in an "all-distillate" Integrated Two-Stage Liquefaction (ITSL) mode using Illinois 6 coal from the Burning Star mine. The primary run objective was to obtain steady-state ITSL performance by replacing spent HTR reactor catalyst with fresh, sulfided catalyst. Secondary objectives were to maintain an "all-distillate" (minimum resid production) product slate and to demonstrate the effects of catalyst addition on the net gas production and hydrogen consumption. Run 245 began on 7 November, 1983, and continued through 12 February, 1984. During this period, 179.0 tons of coal was fed in 2045 hours of operation. Eight special product workup material balances were defined, and the results are presented herein. 6 refs., 32 figs., 20 tabs.

29642 (STEV-BF—83-15) **Gasification of biomass and peat. Progress report for the period 810701-830630.** Sjoestroem, K. (Statens Energiverk, Stockholm (Sweden)). 1983. 196p. (In Swedish). (KTR—83-22). NTIS (US Sales Only), PC A09/MF A01. File Number DE85750840.

The two-year period 6 of the gasification project has been completed according to the plans. The experimental studies have been carried out in the pressurized fluid bed (LDU) and under atmospheric pressure in the flash pyrolysis unit and in the long-term test unit (LRU). The following points have been studied in the LDU: Non-catalytical pressurized conversion of tar and methane at high temperatures. Catalytical pressurized conversion of tar and methane. Pressurized conversion of tar over dolomite. Different principles for continuous feeding of biomass into the fluidized bed. The following points have been studied in the LRU: Same studies as the three first points in the LDU but at atmospheric pressure and extended intervals for the remaining parameters. Sulphur poisoning and carbon formation studies have been initiated. Results: The conversion of the tar and the carbon black are almost complete over dolomite and Ni-catlysts. The Ni-catalysts are highly active for methane conversion. The methane conversion is very little effected by the total pressure. A theoretical model work for scale up has been initiated. Four models simulating different phenomena at the gasification have been created.

29643 (STEV-TORV—83-10) **Development of a pulverized fuel from specially treated peat.** Kinnerberg, H. (Statens Energiverk, Stockholm (Sweden)). Oct 1983. 18p. (In Swedish). NTIS (US Sales Only), PC A02/MF A01. File Number DE85750848.

The prepared, pulverized peat powder fuel appears to be a non-dusty, easy to handle and storable fuel. The agglomerating agent causes, however, an increased internal friction and increased particle bondings, which may complicate feeding, conveying, discharge and other handling operations. Those complications are possible to solve with established technology. The prepared pulverized peat powder fuel is non-explosible and causes no dust-explosion hazards. The prepared pulverized peat powder had very good combustion properties compared to other pulverized fuel. It is ignitible in the combustion chammber and is rapidly combusted. Thus the basic idea of preparing pulverized peat powder with an agglomerating agent has been verified.

29644 **Gasification kinetics and surface areas of catalyzed carbonaceous chars.** Kosky, P.G.; Lamby, E.J.; McKee, D.W.; Spiro, C.L. (General Electric R & D Center, Schenectady, NY). pp 180-181 of 16th Biennial Conference on Carbon. University Park, PA; American Carbon Society (1983). (CONF-830711—).

From 16. American Carbon Society biennial conference; La Jolla, CA, USA (17 Jul 1983).

This paper examines the effect of alkali catalysts in raising the reactivity of coal chars. Mixtures of finely ground coals of various ranks and catalysts were pyrolyzed for 2 hr. in N_2 at 700°C. Aliquots of the chars were ground and the gasification rates in CO_2 and $H_2O(g)$ were measured in a thermogravimetric balance. BET-surface areas of the chars were measured using CO_2 and N_2. The results indicate that reactivity increases with catalyst concentration but there is a decrease in both the N_2 and CO_2 areas. It is determined that the effect of alkali catalysts in raising the reactivity of coal chars is not due to a massive increase in the internal surface area of the chars as a result of the catalyst salts.

0105 By-products

29645 (CERI-CRR—84-1) **The costs of transportation fuel from methanol versus oil sands.** Summer, B.D.; Gibson, T.; Slagorsky, Z.C. (Canadian Energy Research Institute, Calgary, Alberta). Dec 1984. 121p. Canadian Energy Research Institute, Calgary, Alberta.

The report examines the relative economic attractiveness of two alternative ways of supplying fuel in Canada in place of imported or conventional crude oil. The two options are: to build and operate a series of medium-size methanol plants using domestic natural gas as a feedstock and to blend the methanol with gasoline; or to build and operate a synthetic oil sands plant similar to the existing Syncrude Canada Ltd. plant, to refine the output into motor gasoline and deliver it to the same set of blending locations as in the first option.

29646 (DOE/MC/21382—1865) **Assessment of blast furnace retrofit for the co-manufacture of steel, electricity, and synfuels. Final report.** (Mueller Associates, Inc., Baltimore, MD (USA)). May 1985. Contract AC21-84MC21382. 96p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85011949.

The objective of this study was to assess a potentially high payoff concept through preliminary engineering. Two retrofit approaches were evaluated in the study: minimal retrofit and synfuels retrofit. The minimal retrofit approach consists of operating a blast furnace with a minimum amount of changes to its operating conditions. The blast furnace combustion temperatures and amount of gas produced are maintained at substantially similar levels to normal blast furnace operation for pig iron production. In the synfuels retrofit approach, the minimum retrofit case was upgraded to an oxygen-blown, medium-Btu gasifier suitable for the production of synthesis gas. This gas can then be converted to electricity, substitute natural gas, or methanol. This concept, which was based on converting a blast furnace to a British Gas/Lurgi slagging gasifier, appears to be technically feasible. While some engineering problems were identified, they do not appear to be insurmountable. The synfuels retrofit facility, designed to produce electricity, methanol, or substitute natural gas from coal, shows a capital investment of $1.726 billion or $62.8 per trillion Btu. When compared to a grass roots facility producing the same product slate ($70.3 per trillion Btu), the retrofit represents a savings or cost avoidance of only 10% over a new facility. It can be concluded that the economics of coal gasification, in general, are currently not favorable due to the relatively low cost and apparent availability of oil and natural gas. Even site favorable situations, such as integration with steel mill operations, do not seem to be sufficient to make blast furnace retrofits economically attractive at this time. 26 refs., 15 figs., 13 tabs.

29647 (DOE/R8/05032—T1) **Production of mineral wool from lignite coal slag.** Manz, O.E.; Eaton, L.C. (Mercer County Energy Development Board, Hazen, ND (USA)). 1 Mar 1983. Contract FG48-81R805032. 14p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013335.

This is a report of research conducted at the University of North Dakota concerning the utilization of the "molten state" condition of lignite coal slag for the fabrication of a mineral wool insulant. The research was funded by the Mercer County Energy Development Board with monies allocated from the Department of Energy. The objective of the research was to investigate, on a preliminary basis, some critical criteria such as the chemical nature of the raw material, the ability of the slag to be fiberized, as well as the possibilities that such a insulant could indeed have a market in the immediate area. In essence it was felt that a mineral wool product could be produced at coal fired power plants which burn lignite at a minimal cost. The major cost saving would come from the fact that the raw material that would be used would not have to have a great deal of energy added at the expense of the consumer.

29648 (DOE/ET/13381—T3) **Aliphatic components of coal. Final report, September 1, 1978-August 31, 1980.** Deno, N.C. (Pennsylvania State Univ., University Park (USA)). Sep 1980. Contract AC22-78ET13381. 69p. (FE—3159-1-80). NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85002197.

The principal objective of the contract was to determine the chemical structures of the aliphatic components of coals, coal macerals, and coal-derived materials. The initial concept was to develop PTFA (H_2O_2-CH_3COOH-H_2SO_4) oxidative degradations. This was done and in addition a new procedure for oxidative degradation with HNO_3 was developed. The two methods compliment each other and taken together, they allow much to be learned about the aliphatic components of coal structure. This report contains the following four appendices: (1) linear alkane chains in coals; (2) low temperature chemical fragmentation of coals; (3) chemical changes in coal liquefaction; and (4) survey of the chemical structures of twenty-seven coals as determined by oxidative degradation. All four of these papers have been processed for inclusion in the Energy Data Base.

29649 (DOE/ET/13381—T3, pp 11, App. A) **Linear alkane chains in coals.** Deno, N.C.; Curry, K.W.; Jones, A.D.; Keegan, K.R.; Rakitsky, W.G.; Richter, C.A.; Minard, R.D. Sep 1980. NTIS, PC A04/MR A01. File Number DE85002197.

In Aliphatic components of coal. Final report, September 1, 1978-August 31, 1980.

When coals are oxidized with 40% aqueous nitric acid at 60°, the products include a homologous series of linear aliphatic diacids starting with the four carbon succinic acid. These are stable under the conditions of oxidation so that their amounts and lengths measure the amounts and lengths of the saturated components of linear aliphatic chains in the coals. In one coal (PSOC-155) they account for 38% of the carbon and members of the series up to C_{28} were detected. Evidence is presented indicating that these chains are integral parts of the coal structure and not interspersed contaminants. 26 refs., 3 tabs.

29650 (DOE/ET/13381—T3, pp 13, App. B) **Low temperature chemical fragmentation of coal.** Deno, N.C.; Curry, K.; Jones, A.D.; Minard, R.; Potter, T.; Rakitsky, W.; Wagner, K.; Yevak, R.J. Sep 1980. NTIS, PC A04/MR A01. File Number DE85002197.

In Aliphatic components of coal. Final report, September 1, 1978-August 31, 1980.

Trifluoroperoxyacetic acid chemically fragments coals at 25 to 80°. The reagent is so selective for oxidizing aromatic rings and is so inert towards benzylic hydrogen that isopropylbenzene, tetralin, indan, and dihydrophenanthrene have their benzene ring(s) totally destroyed without any evidence of oxidation at the benzylic hydrogen. The fragments contain more and different structural information relative to conventional oxidations with Mn (7+), Cr (6+), HNO_3, and O_2. These latter selectively oxidize benzylic hydrogen. Products from 27 selected coals show that 9,10-dihydroanthracene and 9,10-dihydrophenanthrene units are prominent features in most bituminous coals in accord with Given's structure of coal. Their frequency accounts for the fact that no continuous fused ring structure or graphite structure exists. The only simple alkyl substituent is methyl. Liquefaction (solvent refining) sharply increases the amount of arylmethyl and aromatic structure and causes the apearance of unsubstituted phenyl groups. Nitric acid degradations have been reinvestigated and are developed into a premier method for analyzing the amounts and lengths of linear alkane chains in coals. Generally, the amounts of such chains represent 0 to 2% of the carbon in coal, but in one Utah coal they account for about 42% of the carbons. 12 refs., 6 tabs.

29651 (DOE/ET/13381—T3, pp 11, App. C) **Chemical changes in coal liquefaction.** Deno, N.C.; Curry, K.W.; Cwynar, J.E.; Jones, A.D.; Minard, R.D.; Potter, T.; Rakitsky, W.G.; Wagner, K. Sep 1980. NTIS, PC A04/MR A01. File Number DE85002197.

In Aliphatic components of coal. Final report, September 1, 1978-August 31, 1980.

Mobil Research and Development Corp. supplied five coals and their soluble and insoluble fractions after 3 minutes solvent refining and their soluble fraction after 90 minutes solvent refining. All samples were oxidatively degraded with CF_3CO_3H-H_2SO_4. The major effects of solvent refining on molecular structure were the large increases in arylmethyl, arylphenyl, and total aromatic material. Liquefaction (solvent refining) of coal involves thermolysis of benzyl-oxygen and/or benzyl-benzyl bonds as the first step in the depolymerization. This view derives from NMR studies, studies with model compounds, and oxidative degradations with $Na_2Cr_2O_7$ and $CF_3CO_3H_2$. The oxidative degradations with CF_3CO_3H are now extended to five new coals. Products have been determined from the original coal, the soluble and insoluble fraction after 3 minutes, and the soluble fraction after 90 minutes. The data are summarized in Tables 1 and 2. The best method for determining the amount of arylmethyl groups in coals is from the yield of acetic acid formed in oxidative degradation with CF_3CO_3H-H_2SO_4. The data from this method are shown in Table 1, and results are discussed. 7 refs., 4 tabs.

29652 (DOE/ET/13381—T3, pp 29, App. D) **Survey of the chemical structures of twenty-seven coals as determined by oxidative degradation.** Deno, N.C.; Cannon, C.; Curry, K.W.; Cwynar, J.E.; Jones, A.D.; Minard, R.D.; Potter, T.; Rakitsky, W.G.; Wagner, K.; Yevak, R.J. Sep 1980. NTIS, PC A04/MR A01. File Number DE85002197.

In Aliphatic components of coal. Final report, September 1, 1978-August 31, 1980.

Oxidative degradation using CF_3COOH-H_2O_2-H_2SO_4 has been applied to 27 coal samples. For 24 of the 27 samples, there are common major products and similarities in the categories of products. Two samples gave entirely different products, and a third sample had an intermediate nature. The results are interpreted as supporting aromatic-hydroaromatic structures as the dominant feature of most bituminous coals. The method allows the rapid recognition of coals of unusual chemical structure. 17 refs., 11 tabs.

29653 (DOE/PC/30224—5) **Coal structure and reactivity: the macromolecular structure of coal. Final report.** Larsen, J.W.; Green, T.K. (Tennessee Univ., Knoxville (USA). Dept. of Chemistry). Mar 1984. Contract FG22-80PC30224. 181p. NTIS, PC A09/MF A01; 1; GPO Dep. File Number DE85013165.

Coals are considered to be three-dimensionally covalently crosslinked macromolecular networks. Solvent swelling techniques, modern polymer theories, and regular solution theory are applied to two bituminous coals in an effort to estimate their crosslink densities. The coals are observed to be extensively, internally hydrogen bonded. The hydrogen bonds serve as crosslinks between the macromolecular chains and contribute substantially to the structural integrity of the coals. Both coals obey the predictions of regular solution theory and their nonpolar solubility parameters are estimated to be 9.5 (cal/cm^3)/sup 1/2/. Flory interaction parameters were calculated for a series of nonpolar solvent-coal pairs. The Flory-Rehner and Kovac equations were then applied to the available data to estimate the crosslink densities of the coals. 124 refs., 37 figs., 27 tabs.

29654 (DOE/PC/40810—11) **Synthesis of oligomeric models of coal derived materials for use with GPC calibration. Quarterly report, October-December 1984.** Baltisberger, R.J.; Jones, M.B. (North Dakota Univ., Grand Forks (USA)). Dec 1984. Contract FG22-81PC40810. 12p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85009619.

Gel permeation chromatographic analyses have been performed for a series of acetylated solvent refined lignite (SRL) asphaltenes and preasphaltene samples, and model compounds. The data are consistent with a need for a size and shape correction based on aromatic condensation to be included in the calibration graph for the response of molecular weight with retention time. In order to test this hypothesis, a series of poly(vinyl)naphthalene oligomers have been synthesized for isolation into narrow molecular weight ranges by preparative GPC techniques. Poly(vinyl)naphthalene oligomers in the range 300 to 2000 g/mole have been synthesized. 2 figs.

29655 (DOE/PC/50801—10) **Laser induced coal fluorescence. Tenth quarterly technical progress report, January 1-March 31, 1985.** Borst, W.L. (Southern Illinois Univ., Carbondale (USA); Texas Tech Univ., Lubbock (USA)). 1985. Contract FG22-82PC50801. 20p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012351.

The work performed during this period consisted of the completion of time resolved data acquisition and reduction of New Albany shale rank series, preliminary testing of a new deconvolution method, and the writing of additional software. The data acquisition consisted of 21 decay curves, one taken every 10nm over the fluorescence emission range of 450 to 650nm for each alginite maceral investigated. Approximately five alginite macerals were examined from each of the thirteen samples making a total of 61 macerals (1281 decay curves). The decay data were deconvoluted, resulting in decay times and percentages of fluorescing compounds as a function of wavelength. Because of the massive amount of data we are able to collect in a relatively short time and the fact that the current iterative deconvolution method requires a relatively large amount of time, it became imperative that a new deconvolution method be investigated. The new method was suggested by Dr. Robert Zitter, and, for the purpose of this report, is tentatively named the "Zitter Method." The software written during this period consisted primarily of additional data storage and presentation routines. 14 figs., 2 tabs.

29656 (DOE/PC/50807—T9) **Reaction calorimetry for coal chemistry and catalysis. Quarterly report, February 1, 1985-April 30, 1985.** Arnett, E.M. (Duke Univ., Durham, NC (USA). Dept. of Chemistry). 1985. Contract FG22-82PC50807. 17p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85010144.

Extension of the thermochemical approach to the study of hydrogen bond interactions on silica gel and its homogeneous analogue, triphenylsilanol, is presented here. This thermochemical study is analogous to that presented by R. Haaksma in previous reports (i.e., Annual Report August 1983 to July 1984). Heats of immersion were determined on the Setaram C-80 Tian-Calvet Calorimeter. While Haaksma used Dowex and p-toluene sulfonic acid as models for Broensted (proton transfer) processes in the thermochemical comparison, we are testing silica gel and triphenylsilanol as models for hydrogen bonding interactions. 9 refs., 3 figs., 5 tabs.

29657 **(DOE/PC/60785—7) Organic oxygen characterization of coal and coal liquids. Quarterly progress report, February-April 1985.** Ehmann, W.D.; Hamrin, C.E.; Koppenaal, D.W. (Kentucky Univ., Lexington (USA)). May 1985. Contract FG22-83PC60785. 26p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012329.

Organically bound oxygen is one of the most abundant elements in coal, yet the amount and quality of data covering its abundance, mode of occurrence and processing behavior are relatively lean. The rectification of this problem will require the development of appropriate methods of oxygen determination which have been lacking in the past. The stature of coal science today demands a technique for organic oxygen determination other than the outdated and error-prone "oxygen-by-difference" calculation. This investigation addresses this need and intends to develop methods suitable not only for total organic oxygen determination, but also for determination of oxygen functionality. The methods and techniques developed will then be applied to practical needs in characterizing the oxygen geochemistry of coal and the evaluation of coal drying in solvents on liquefaction behavior. 9 refs., 3 figs., 8 tabs.

29658 **(DOE/PC/70006—T2) Enthalpy and phase behavior of coal derived liquid mixtures. Technical progress report, January-March 1985.** Yesavage, V.F.; Kidnay, A.J. (Colorado School of Mines, Golden (USA). Dept. of Chemical and Petroleum Refining Engineering). 30 Apr 1985. Contract FG22-84PC70006. 16p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011199.

On July 15, 1984, work was initiated on a program to study the enthalpy and phase behavior of coal derived liquid model compound mixtures. During the third quarter modifications to both the calorimeter and the phase equilibria system were completed. The phase equilibria system was checked out against literature data for methanol/ethanol. Results of these tests are included in this report. The calorimeter was evaluated using previously confirmed heptane data and published data by Thinh, et al. These results are also reported. Initial calorimetry data have been obtained for tetralin and the data will be reported when the data set has been completed. 5 refs., 5 figs., 3 tabs.

29659 **(DOE/PC/70776—T3) Characterization of coal surfaces. Technical progress report, 5 February 1985-20 May 1985.** Fuerstenau, D.W. (California Univ., Berkeley (USA). Coll. of Engineering). Jun 1985. Contract FG22-84PC70776. 17p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013149.

Estimates of γ/sub LC/, critical wetting surface tension, obtained with the film flotation technique were compared directly with results obtained with the immersion-time technique. Values for both raw and oxidized coals with the film flotation technique were in the range of 35 to 65 erg/cm^2 which is the range of values obtained by contact angle, freezing-front, and immersion-time methods. The film flotation and the potentiometric titration techniques were investigated in quantifying changes in coal surface properties due to oxidation. Coal susceptibility to oxidation was defined and correlated to coal properties. Low-temperature, low-pressure quinoline solubilization was found to be completely retarded by thermal oxidation. 24 refs., 4 figs., 5 tabs.

29660 **(EUR—9045-EN) Studies of the mechanical and chemical properties of coke at high temperature (Report on ECSC contract 7220-EB/818).** (Commission of the European Communities, Luxembourg). 1984. 74p. European Community Information Service, 2100 M St., NW, Suite 707, Washington, DC 20037.

An account is given of studies carried out on the properties of coke at high temperatures. The work consisted of two separate, but complimentary approaches, namely, the study of the resistance to breakage and abrasion of samples of coke tested in a refractory drum which could be heated to a temperature of 1450 C and a study of the dependence of the tensile strength of coke upon test temperature, heat treatment and with partial gasification of the coke, also at temperatures within the range of 1000-1400 C. The tests carried out in the high-temperature drum are described in Part 1 of the report and the effect of heat-treatment on coke tensile strength in part 2. (16 refs.)

29661 **(IFP—32-035) Study of size and structure of asphaltenes from crude oil by gel permeation chromatography.** Gourlaouen, C. (Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison). Apr 1984. 199p. (In French). NTIS (US Sales Only), PC A09/MF A01. File Number DE85751219.

Polydispersion of asphaltenes is demonstrated by gel permeation chromatography. Global characterization of asphaltenes shows only an average of the different species. A detailed characterization requires a fractionation. Three asphaltenes (Boscan, Safaniya and Minas) were fractionated on a polystyrene gel column. On each fraction C, H, O, N, S, Ni and V content are determined. Molecular weights are determined by vapor pressure, osmotic pressure and light scattering at small angle, in the later case corrections are required because of fluorescence. Molecular weights range from 1500 to 100 000 and metal repartition is not homogeneous in all fractions. In the case of Boscan porphyrins were evidenced.

29662 (IS-EMRRI—19, pp 29-35) **Rapid dissolution of coal and minerals for analysis.** Kilpatrick, P.D.; Markuszewski, R. Dec 1983. NTIS, PC A07/MF A01. File Number DE85011356.

In Iowa State Mining and Mineral Resources Research Institute. Final report, July 1, 1982-September 30, 1983.

For many of the analytical methods employed for the determination of major, minor, and trace constituents in coal, the sample has to be first dissolved by a convenient and reliable method. Most dissolution methods are tedious and require unusual procedures. A rapid method for dissolving coal is being developed, based on digestion of a small coal sample with an acid mixture consisting of concentrated nitric, perchloric, and phosphoric acids. The resulting solution will be used for analyses by conventional spectrophotometric or other methods.

29663 **(NE-SBT—83-16) Importance of storage on peat quality.** Thoernqvist, T. (Naemnden foer Energiproduktionsforskning, Spanga (Sweden)). 1983. 28p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. File Number DE85750861.

In this pilot study, the effect of storage on peat quality has been studied. Three piles have been studied, each containing approximately 55 m^3 of peat. In one of the piles milled peat was stored which contained 15 percent water at the time the pile was laid up. The second pile consisted of sod peat with a moisture content of 41 percent. The third pile was peat which had been dewatered with the Multibelt method to moisture content of 77 percent. The storage period lasted from August 1982 until January 1983. The temperature in the Multibelt-dried peat pile was 5 to 10 C degrees above the surrounding area outside during the entire storage period. The temperature in this pile was registered at six measurement points. The average moisture content value increased in the pile with the milled peat up to 27 percent, and in the pile with the sod peat up to 44 percent. In the pile with the multibelt-dried peat the average moisture content did not change during the storage period. The dry substance loss, based on loss of organic material in nylon net sacks, was 1.3 percent in the milled peat pile, 2.9 percent in the sod peat pile and 0.8 percent in Multibelt-dried peat pile. Ash content increased in milled and sod peat from 1.3 percent to 1.7 percent, i.e., an increase of about 30 percent. In the Multibelt-dried peat, however, a reduction was noted in the ash content from 12.3 to 6.5 percent (about 47 percent ash content reduction). The dry peats efective heating value decreased during the storage period by 4.8 percent in the milled peat, and 5.2 percent in the sod peat. The heating value of the Multibelt-dried peat did not change the storage period.

29664 (NIPER—20, pp 287-298) **Thermophysical properties of real and synthetic fluid mixtures derived from fossil substances.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Vapor-liquid-equilibria measurements and correlations were made on the following systems: hydrogen + water + tetralin at 542 K and to 24.06 MPa; tetralin + water at 541, 620, and 660 K and to 8.28 MPa; water + quinoline at 542 and 622 K and to 12.72 MPa; hydrogen + water + ammonia + tetralin + quinoline + 1-naphthol at 542 and 622 K and to 25 MPa; hydrogen + a cut boiling 450°-950°F from a thermal hydroliquefaction unit at 573, 623, and 673 K and to 2250 psia; and hydrogen + SRC II coal liquids. The results were used to show significant interactions between the polar and hydrogen species in fluids from coal and heavy ends of petroleum. The results also show that the chemical reaction of ammonia with phenolic compounds occurs readily, and processing of these materials can lead to significant production of carcinogens through such reactions. Efforts are currently being made to provide the needed data for the selection of a set of inspection properties to be used in predicting the energy requirements and the extent of separation in process phase separation units for coal liquids and liquids from heavy petroleum. The requirements for speed-of-sound data needed for the development of absolute calibration of gas flowmeters by sonic nozzles were established. Methane was selected for measurements to serve as a basic set in an integrated international effort to supply the required data, and the materials and instruments for the studies were prepared for the measurements.

29665 (SERI/CP—234-2506, pp 27-33) **Premium Coal Sample Program - a model.** Vorres, K.S. (Argonne National Lab., IL). Nov 1984. NTIS, PC A05/MF A01. File Number DE85006284. (CONF-8408106—Summ.). Contract W-31-109-ENG-38.

From Standards in biomass for energy and chemicals workshop; Gaithersburg, MD, USA (1 Aug 1984).

The Premium Coal Sample Program at the Argonne National Laboratory is intended to provide high quality, well characterized coal samples to the basic research community involved in coal studies. The overall goals are described, as well as the collection, transport, processing, analysis and distribution of the samples. Similarities and differences between coal and biomass samples will be discussed. A number of questions for processing which need to be considered are addressed.

29666 (STEV-TORV—84-6) **Classification of peat. An investigation of the physical properties of peat and the methods of determination.** Staffanson, H.; Fredriksson, D. (Statens Energiverk, Stockholm (Sweden)). 1984. 102p. (In Swedish). NTIS (US Sales Only), PC A06/MF A01. File Number DE85750863.

The project deals with the physical properties of natural peat. 149 samples of peat have been analysed. The samples represent the main types of peatlands (bogs, mixed mires and fens) and different peat types (sedge peat - sphagnum peat). The result shows that bulk density of peat can be predicted in field by using a wetness scale (B1-10) where B1-3 is dry peat, B4-6 normally wet peat and B7-10 is extremely wet peat. Bulk density can be measured in laboratory by using the pyknometer method with paraffin oil as liquid. Bulk density also has a high correlation towards water content. However, the measurements of the water content give too low values. Therefore, bulk density gets overestimated when using the water content/bulk density correlation. To get reliable values of bulk density it is necessary to take volume determined samples. The Russian centrifugal method (GOST 10650) for the determination of humification has been tested. The method gives a very weak correlation towards von Posts H-scale and also towards bulk density. The method, in its present stage, is not recommended for further analyses of the humifiction degree. It is concluded that bulk density is the most important factor to influence on the energy content per volume unit and that bogs/sphagnum peat contains in average 25 percent less energy per volume unit than fens/sedge peat. The difference is up to 80 percent due to the difference in bulk density and 20 percent due to lower heating value per weight.

29667 (VTT-TIED—391) **Coal characteristics.** Moilanen, A.; Aeijaelae, M. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). 1984. 331p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo (Finland).

Data about coal characteristics have been gathered from the literature. The interdependence between coal characteristics are introduced. The characteristics depicting the degree of carbonization and correlations between other properties are primarily included. Factors depending on the degree of carbonization are primarily the carbon content of coal and the reflectance of vitrinite. Data about coal deposits in different countries (location, seams, general properties) are presented. The following characteristics of coal seams are presented; properties of economic significance (moisture, ash content, heat value); operating-technical properties (volatile substances, sulphur content, appearance of sulphur, grinding properties, chloride content, ash content and its melting behaviour); properties of environmental significance (microelement and heavy metal contents); chemical and structural characteristics (elemental analysis, petrographic properties); and cleaning-technical properties (ash composition, content of pyritic sulphur). (In Finnish)

29668 (DOE/FE/60181—T1) **Catalytic activity of western coal fly ashes on the reduction of flue gas NO/sub x/.** Bobman, M.H.; Weber, G.F. (North Dakota Univ., Grand Forks (USA). Energy Research Center). 1985. Contract FC21-83FE60181. 16p. (CONF-850304—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85004275.

From 7. international symposium on ash utilization; Orlando, FL, USA (4 Mar 1985).

The purpose of this investigation was to evaluate the use of fly ash to catalyze the reduction of NO/sub x/ by ammonia. A fixed-bed reactor through which simulated flue gas flowed at a rate of 0.5 scfm was operated to measure the catalytic activity of three low-rank coal-derived fly ashes. Also, a 130 scfm propane-fired combustor and high temperature baghouse were used to determine NO/sub x/ reduction. Results of these tests demonstrated a relationship between the temperature of reaction, fly ash composition, crystalline phases as identified by x-ray diffraction, and the level of NO/sub x/ reduction; the quantity and form of occurrence of iron in the ash was shown to dramatically influence fly ash catalytic activity. Conversion of NO/sub x/ catalyzed by fly ash was limited. Depending upon the outcome of federal legislation in the area of pollution abatement, the issue of NO/sub x/ emissions from large boilers may not be significant in the near term. Therefore, the applicability of marginally effective NO/sub x/ control methods may be of interest only after additional research has been completed to improve upon the technical and economic feasibility of flue gas NO/sub x/ control. If the regulatory environment changes in favor of flue gas NO/sub x/ treatment, one situation in which the fly ash material may benefit a utility is in the case of a combustor which generates an ash high in available hematite. 16 refs.

29669 (DOE/PC/60270—T1) **Acoustic agglomeration of power plant fly ash. Fourth quarterly report, June 8-September 7, 1984.** Reethof, G. (Pennsylvania State Univ., University Park (USA). Center for Air Environment Studies). 7 Dec 1984. Contract AC22-83PC60270. 42p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85004132.

Progress is reported on all four tasks of the work statement. The computer code for the simulation approach to the agglomeration process is now complete with the development of a fast and accurate numerical scheme. The hydrodynamic interaction of spherical aerosol particles in a high intensity acoustic field was completed. We showed that the refill process in one cycle can be explained by this process by adding Brownian movement and gravitational effects. The acoustic absorption studies at elevated temperatures are proceeding. The capacitive type sound source has been constructed. The required electronics is also complete. Delivery of the 1 in. internal diameter quartz tube is set for the mid-December period. The 700°F agglomerator system is now fully operational after testing phase. The current problem seeks to explain a consistent difference between the apparent mass loadings for the no-sound and the with-sound runs. Since sampling occurs in the center of the pipe it appears that acoustic streaming effects may be the cause of this phenomenon. In the next period we shall make measurements at various radial heights using this new capability of the system. A new cleaning system will reduce the uncertainty in the aerosol measurements. The high efficiency siren development is proceeding with receipt of the castings for the resonant air supply system, which are being machined. The bearings and the shaft seals have been received. Assembly will start in the next reporting period.

29670 (DOE/PC/60270—T2) **Acoustic agglomeration of power plant fly ash. Fifth quarterly report, September 8-December 7, 1984.** Reethof, G. (Pennsylvania State Univ., University Park (USA). Noise Control Lab.). 7 Dec 1984. Contract AC22-83PC60270. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85005215.

This quarterly report summarizes work accomplished on acoustic agglomeration of power plant fly ash. This includes: acoustic modeling, basic acoustic investigations, a 700°F agglomerator and the development of a high efficiency siren.

29671 (DOE/PETC/TR—85/7) **Evaluation of advanced separation techniques for application to flue gas cleanup processes for the simultaneous removal of sulfur dioxide and nitrogen oxides.** Walker, R.J.; Drummond, C.J.; Ekmann, J.M. (USDOE Pittsburgh Energy Technology Center, PA). Jun 1985. 101p. NTIS, PC A06/MF A01; GPO Dep. File Number DE85013006.

Thirteen advanced separation techniques were reviewed in detail for application to flue gas cleanup processes. Of these, the three most promising for application to systems for simultaneous removal of sulfur dioxide and nitrogen oxides from flue gas are solvent extraction, electrodialysis, and inverse thermal phase separation. Gas separation membranes would also be promising if a membrane could be developed that would be selective for SO_2 and NO/sub x/. Specific utility or industrial systems incorporating some of these processes are suggested. Preliminary estimates of annual revenue requirements for three gas-separation-membrane flue gas cleanup systems and an electrodialysis system are compared with an estimate for a limestone system with selective catalytic reduction. In addition, fourteen wet simultaneous SO_2/NO/sub x/ flue gas cleanup processes that have progressed beyond bench scale were reviewed for possible modification to incorporate advanced separation techniques. It appeared that in processes where modifications were possible, either such modification would result in marginal improvement, or the process would no longer be recognizable. 147 refs., 10 figs., 9 tabs.

29672 (KHM-TR—104) **Studies of foreign disposals for coal burning wastes.** (Statens Vattenfallsverk, Vaellingby (Sweden). Projekt KOL-HAELSA-MILJOE). Dec 1983. 162p. (In Swedish). NTIS (US Sales Only), PC A08/MF A01. File Number DE85750838.

This report consists of three parts. The first part is dealing with the design of landfills for coal burning wastes. It shows the experiences from fills in Denmark. Finland, Great Britain and USA. The second part is dealing with field investigations at Kollund, Denmark, where the ash from Ensted Power Plant is disposed, and the third part with investigations of profiles from coal ash disposal sites in England.

29673 (KHM-TR—104, pp vp) **Investigation of profiles from coal ash disposal sites.** Jacks, G. Dec 1983. (In Swedish). NTIS (US Sales Only), PC A08/MF A01.

In Studies of foreign disposal for coal burning wastes.

Coal ash disposal sites, 2 to 15 years old, have been investigated. Mosses colonialize uncovered sites after about 2 yers when the pH has gone down to 8-9 from the original value of about 11. By the action of CO_2 in the soil atmosphere, 1-2 percent $CaCO_3$ had been formed in the ash from CaO. Leachates from two of the profiles had pH of about 12. Molybdenum and arsenic, both present in form of anions, were found in elevated concentrations. Molybdenum in the ash is enriched in the grass turf on the top of the profile is likely to be leached out in the portion below. Arsenic in the ash is correlated to the contents of Fe_2O_3 and the leaching may be controlled by adsorption to ferric hydroxides. Gypsum has most likely been present in the profiles but has been leached out. The carbonatization of CaO is an important process that shortens the alkaline period in the disposal site and than than buffers the leachate at a pH of 8-9. The carbonatization ought to be favoured by means of covering the ash with soil as early as possible.

29674 (KHM-TR—104, pp vp) **Field investigations at Kollunds coal ash fill.** Meijer, J.E.; Malmkvist, P.; Svedberg, G. Dec 1983. (In Swedish). NTIS (US Sales Only), PC A08/MF A01.

In Studies of foreign disposal for coal burning wastes.

At Kollund in Denmark the ash from Ensted Power Plant is disposed. Here field investigations of the characteristics of coal ash and the disposal have been done. A separate investigation of ash dusting has been made. The coal ash is at Kollund deposited in a gravel pit. To collect leachate and surface water from the ash a plastic membrane has been laid to cover the bottom and sides of ash pit. After a 18 month period of ash disposal all water which has been collected has been used for preventing dusting. The surface of the fill is compacted from the lorries unloading the ash, While the sides are very loose. Under the compacted surface the ash also has less compaction. The temperature inside the fill is increased to about 40-50 C degrees. This probably has an influence on leachate formation. The moisture content of the ash has been investigated on different levels in the fill. The upper layers of the ash has an increase in the water content due to infiltration. This infiltration has been estimated to 22 and 29 percent of the precipitation at the two measuring points. The surface runoff from the fill has been collected and investigated. The water has been in contact with ash and has increased levels of sulphur, arsenic, molybdenum and chromium. The formation of dust is a problem at the ash outlet at the power plant. At the fill the dust content in air was low.

29675 (NP—5770295) **Briefing package: Low-pollution coal-fired power plants.** Folgmann, B. (Fachinformationszentrum Energie, Physik, Mathematik G.m.b.H., Bonn (Germany, F.R.). Buero Bonn). Sep 1984. 213p. (In German). NTIS (US Sales Only), PC A10/MF A01. File Number DE85770295.

The report presents power plant technologies permitting to use the primary energy source coal for power generation and save the environment at the same time. Subject divisions are processes for final flue gas purification (dust precipitation, flue gas desulfurization and denitrification) and new firing techniques, especially fluidized-bed combustion. Not only are the processes explained but plants are described as examples and experience reported as well. New power plant concepts for using coal in the power plant sector are also dealt with. The state of research and development is documented in a listing of the programmes promoted by the Federal Ministry of Science and Technology. A bibliography containing numerous titles of specific relevance permits readers to explore the subject in greater detail.

29676 (PB—85-175867/XAB) **Assessment of fluidized-bed-combustion solid wastes for land disposal. Volume 1. Final report. Report for June 1980-June 1984.** Grimshaw, T.W.; Minear, R.A.; Eklund, A.G.; Little, W.M.; Dunn, J.E. (Radian Corp., Austin, TX (USA); Arkansas Univ., Fayetteville (USA)). Feb 1985. 258p. NTIS, PC A12/MF A01.

See also Volume 2, PB85-175875; Prepared in cooperation with Arkansas Univ., Fayetteville.

This report, including 10 appendices, gives results of: (1) an analysis of representative samples of fluidized-bed-combustion (FBC) wastes, (2) an assessment of the characteristics of leachates generated from the wastes under laboratory and field (landfill) conditions, (3) a characterization of the attenuation of the leachates by earth materials that are typical of disposal settings, (4) development of a way to predict the leachate generation behavior of FBC wastes under landfill conditions on the basis of laboratory test results by establishing a rigorous statistical relationship between the laboratory and field-leaching results, and (5) assessment of the compatibility of commonly used landfill-liner materials with FBC waste leachates. FBC is an emerging energy technology that holds promise for both high efficiency of energy conversion and minimization of adverse air-quality impacts. A major advantage of FBC is that high-sulfur coal can be burned without the use of flue-gas desulfurization equipment to meet air-quality standards. The solid residues that are generated in an FBC unit are usually larger in volume and have different properties than the typical bottom ash from a conventional boiler.

29677 (PB—85-175875/XAB) Assessment of fluidized-bed-combustion solid wastes for land disposal. Volume 2. Appendices A through C. Final report, June 1980-June 1984. Little, W.M.; Gibson, T.S.; Grimshaw, T.W.; Eklund, A.G. (Radian Corp., Austin, TX (USA)). Feb 1985. 173p. NTIS, PC A08/MF A01.

The solid residues that are generated in an FBC unit are usually larger in volume and have different properties than the typical bottom ash from a conventional boiler.

29684 (TNO-HMT-R—84-76) **Isolating fly ash adsorbed benz(a)anthracene-14 C and benzo(a)pyrene-14 C using liquid extraction.** Besemer, A.C.; Lems, T. (Nijverheidsorganisatie TNO, Delft (Netherlands). Hoofdgroep Maatschappelijke Technologie). May 1984. 16p. (In Dutch). Nijverheidsorganisatie TNO, Delt (Netherlands). Hoofdgroep Maatschappelijke Technologie.

Results are presented of a research program into the properties of fly ash with regard to the adsorption and desorption of polycyclic hydrocarbons. Benz(a)anthracene (with four rings) is adsorbed less than benzo(a)pyrene (with five rings). The composition of fly ash is also important. Results indicate that as the carbon content of the fly ash increases the adsorption increases too. The desorption behaviour, using with good results toluene and xylene, was investigated. The desorption of PAH is better with lower carbon content of the fly ash. (In Dutch)

29685 **Nitration of polycyclic aromatic hydrocarbons adsorbed to different carriers in a fluidized bed reactor.** Ramdahl, T.; Bjoerseth, A.; Lokensgard, D.M.; Pitts, J.N. Jr. (Central Institute for Industrial Research, Oslo, Norway). *Chemosphere;* **13**: No. 4, 527-534(1984). Contract AA03-76SF00034.

The reactivity of selected polycyclic aromatic hydrocarbons (PAH) adsorbed to various surfaces has been studied. PAH were adsorbed to silica, alumina or charcoal particles and exposed to ambient concentrations of NO_2 in air in a fluidized bed reactor. The reaction products were analyzed by capillary gas chromatography and gas chromatography/mass spectrometry. The results show that silica is a more reactive surface than alumina. The charcoal used showed to be very adsorbtive and too little material was recovered for analyses. The relevance of these results to the assessment of the possible formation of nitro-PAH in the atmosphere is discussed.

29686 (IMG-TNO-D—82) **Nuisance caused by (coal) dust coal storage facilities, an inventory and estimation.** Van Dongen, J.E.F. (Nijverheidsorganisatie TNO, Delft (Netherlands). Inst. voor Milieuhygiene en Gezondheidstechniek). Jul 1984. 31p. (In Dutch). Nijverheidsorganisatie TNO, Delft (Netherlands). Instituut voor Milieuhygiene en Gezondheidstechniek.

A dose-(annoyance) response relation with respect to coal dust cannot be developed yet. At best it can be concluded that, at the same deposition, black dust from coal, soot or fly ash causes annoyance sooner than any other kind of dust. However, some dose-response relations of other kinds of dust are available. Although from concentration and deposition measurements it appears that the dispersion of coal dust is limited to 1500 m, a conclusion that for those reasons problems of annoyance also will be limited is premature. Both on the doses side and the effect side intervening factors play a role, which have been insufficiently analyzed with respect to the annoyance. This concerns items such as the frequency of special weather conditions, the use of transport routes, emissions from other dust sources and occurrence of other environmental effects like noise. (In Dutch)

29687 **Emanation coefficients for Rn in sized coal fly ash.** Kalkwarf, D.R.; Jackson, P.O.; Kutt, J.C. (Pacific Northwest Lab., Richland, WA). *Health Physics;* **48**: No. 4, 429-436(Apr 1985). Contract AC06-76RL01830.

Emanation coefficients for ^{2}n^{22}Rn in sized samples of dry coal fly ash were evaluated as a function of source and particle size using a modification of the sealed-can, gamma-only technique. The emanation coefficient is defined as the fraction of Rn atoms that escape the solid particles of a source. Diffusible Rn was separated from non diffusible Rn by adsorption on charcoal, and each was measured independently by γ-ray spectrometry of the Rn daughter, ^{214}Bi. Samples of ash from eastern bituminous coal, western bituminous coal and mid-western bituminous coal with aerodynamic equivalent diameters of less than 15 μm were examined, and the measured emanation coefficients ranged from 0.098 down to 0.007. For unfractionated standard fly ash, SRM 1633a, from the US National Bureau of Standards, the emanation coefficient for ^{222}Rn was found to be 0.018. The results suggest that only a small fraction of the Rn in lung-deposited fly ash will be removed by exhalation.

29688 **Persistence of phenols in aquatic microcosms receiving chronic inputs of coal-derived oil.** Southworth, G.R.; Herbes, S.E.; Franco, P.J.; Giddings, J.M. (Oak Ridge National Lab., TN). *Water, Air, and Soil Pollution;* **24**: 283-296(1985). Contract AC05-84OR21400.

The environmental fate of constituent phenols of a coal-derived oil spilled intermittently on water was evaluated in aquatic microcosms. Phenols dissolved rapidly from the oil into the water, and initially accumulated with sequential oil additions. The major process removing phenols from the microcosms was microbial degradation - other processes were negligible in comparison. After phenols attained maximum concentrations in the first 28 days of the study, degradation rates exceeded input rates in all microcosms during the second 28 days the study and total phenol concentrations decreased. Significant differences were apparent in the rates of degradation of various alkylphenol isomers and isomer groups, but no compounds were observed to be refractory. Upon discontinuation of oil inputs at day 56, dissolved phenols disappeared within several weeks. Microcosm exposures history and the presence of other phenol isomers affected the rate of removal of individual isomers, complicating predicting of the rate of removal of individual toxicants.

29689 **(INIEX-FOL—6173) Geomechanical tests on rock samples from the KS 3 borehole (Dilsen).** van Duyse, H. (INTEX, Liege (Belgium)). Aug 1984. 16p. (In French). INIEX, Liege, Belgium.

For the purpose of investigating rock hardness in the coal strata north of Eisden workings, a series of geomechanical tests was conducted on cores of sandstone extracted from the KS 3 borehole at Dilsen. The tests sought to establish the following: uniaxial compression, traction, hardness, abrasiveness, quartz content and grain size, wear factor F and the texture and type of rock present. Gives details of how these factors were investigated (test equipment, types of drill bit used, etc.) and gives the results obtained, including the fact that the core samples revealed 18.8% sandstone - slightly more than in the Kempen coalfield. (In French)

29690 **(INIEX-FOL—6368) Geomechanical tests on rock samples extracted from the KS 9 and KS 12 boreholes.** van Duyse, H. (INTEX, Liege (Belgium)). Jul 1984. 6p. (In French). INIEX, Liege, Belgium.

The introduction of the Bouygues tunnelling machine at Zolder colliery was the reason for instigating a programme of compression and tensile tests on sandstone core samples extracted from boreholes KS 9 and KS 12 located to the north and north-east of the pit. The samples were restricted to rock strata which could be cut by the Bouygues machine. Describes the position of the boreholes and the samples taken. Concludes that the rock strength values obtained are lower than those measured from the KS 3 sandstone cores extracted at Dilsen. (In French)

29691 **(NP—4901587) Picture Butte coal project: a technical assessment of Picture Butte, 1983. [Final report].** (Associated Mining Consultants Ltd., Calgary, Alberta (Canada); Golder Associates, Calgary, Alberta (Canada)). Jun 1983. 150p. NTIS (US Sales Only), PC A07/MF A01. File Number DE84901587.

The observations and data obtained from the TMP at Kipp Mine, together with correlation of geotechnical data from that area and the limited geotechnical data from the Picture Butte area indicate the following: (1) Inseam physical characteristics and behavior of the coal and proximate roof and floor strata at Kipp indicate that with proper selection and application of today's coal mining technology, a longwall system of mining is possible at Picture Butte. (2) Main entries required for the long term should be driven as small as practicable and supported by arches complemented by roof bolts where required. The preferred direction of main entry driveage is south to north or north to south - the "weak roof" direction. (3) Service roadways for longwall retreat required for a short-term should be driven as narrow as possible, and rectangular in shape, in an east to west or west to east direction - the "good roof" direction. Roof bolts adjacent to the ribs of the retreat pillar of coal to be mined should be angled over the rib to help prevent roof fractures parallelling the rib line at or near the face, thereby reducing rock dilution of the coal. (4) Service roadways for longwall advance must be of the arch type, supported by rigid or yielding arches, these would also be driven in the "good roof" direction. Roadside packs of hardwood, anhydrite or aqua-packs can provide adequate roadway stability.

29692 **(ACIRL-PR—84-18) Mine plan drafting.** Deakin, J.J.; Puckett, G.A. (Australian Coal Industry Research Labs. Ltd., North Ryde). Dec 1984. 65p. Australian Coal Industry Research Labs. Ltd., North Ryde.

This report describes the underground mine plan drafting system, MINDRAFT. The package was developed by Australian Coal Industry Research Laboratories Limited (ACIRL) as part of a five year research program which will result in a suite of underground mine planning software packages. MINDRAFT provides a graphics vehicle for the mine planning software which encompasses: automatic generation of different mine layouts; evaluation of layouts using varying production rates and resources; analysis of ventilation systems; stochastic simulation of underground mining processes, from the working face to the raw coal stockpile; and optimisation of longwall relocation times by use of critical path analysis. Although primarily a planning tool, MINDRAFT is beneficial in an operational sense, being used for colliery plan production and conversion between grid co-ordinate systems. (20 refs.)

29693 **(CSIRO-DG-GCM—57) Physical model study of caving under massive sandstone roof conditions at Moura, Queensland.** Wold, M.B. (Commonwealth Scientific and Industrial Research Organization, Mount Waverley (Australia). Div. of Geomechanics). 1984. 68p. CSIRO, Division of Geomechanics, Mount Waverley, Australia.

A physical model of the region at the Theiss Dampier Mitsui mine, Moura, Queensland, for which longwall mining is under consideration was constructed to a scale of 1:150. The model represented a vertical slice from -100 m to -300 m in depth and about 200 m in the ENE-WSW direction, and was loaded biaxially to simulate the in situ rock stress conditions. The mechanical, structural and lithological features of the rock mass were modelled using specially developed low strength materials which satisfied the necessary scaling requirements. The model contained in excess of 8000 blocks, representing in situ blocks ranging in size from 1 m x 2 m to 2 m x 4 m. Portions of two coal seams were progressively mined from the model while loads were measured on an instrumented model longwall support. Roof caving and goaf formation mechanisms were recorded and measured using high precision photogrammetry. The model provided data on caving spans, bulking factor, caving height, angle of break, support loads, and the influence of structural geology and horizontal stress. (7 refs.)

29694 **(CSIRO-DG-GCM—58) Research for deep opencast coal mines - European practice.** Dunbavan, M. (Commonwealth Scientific and Industrial Research Organization, Mount Waverley (Australia). Div. of Geomechanics). Sep 1984. 23p. CSIRO, Division of Geomechanics, Mount Waverley, Australia.

Geotechnical research in the European surface coal mining industry is based chiefly on problems arising from the effect of mining on the land surface and groundwater in the vicinity of the mine site. The level of activity is low compared with geotechnical research for civil engineering projects and nuclear waste disposal. Some of the geotechnical analyses and instruments developed for civil engineering applications could be applied in geotechnical investigations at surface coal mines. The geological and environmental conditions associated with surface black coal mining differ significantly between Europe and Australia. Thus, surface mining technology developed in Europe should not be accepted in Australia unless an adequate geotechnical review of its suitability is undertaken. Mining conditions in brown coal deposits are similar for Europe and Australia and much of the mining technology, especially that developed by the Rheinbraun company, could be adapted for Australian mines. The higher operating costs of European mines and the more difficult mining conditions mean that mine operators keep a close account of the cost of pit wall instability. The operating conditions in Australian surface coal mines make similar economic analyses of pit wall instability impractical. However, the introduction of different mining methods in future mines and a more competitive world market for coal should prompt operators of Australian mines to adopt regular systematic pit wall surveillance methods as part of their assessment of overall operating costs. Early detection of pit wall instability would help in the reduction of the impact of slope movement on coal mining in the most cost-effective way. (12 refs.)

29695 **(DOE/MC/20184—1829) Evaluation of in-place gas, reserves and production potential of coalbed gas using a vertical boreholes pattern. Final report, September 1, 1983-December 31, 1984.** Al-Saadoon, F.T. (Texas A and I Univ., Kingsville (USA). Dept. of Chemical and Natural Gas). May 1985. Contract AC21-83MC20184. 38p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85011388.

The primary objective of this study was to evaluate in-place gas, reserves and production potential of coalbed gas using a vertical boreholes pattern. The DOE-US Steel project in the Warrior Basin is selected as a specific site analysis because of the abundance of data, including 7 years of production history, available on the project. Three models were developed for the implementation of the preceding objectives. The first model is based on the extension of the production decline curve method, the second model is based on the extension of the volumetric method, and the third model is based on the material balance method. The Gas Research Institute Mathematical Model, designated WELL2D, was tried to implement solutions for the two-dimensional (areal) flow-field associated with the transport of gas and water through a vertical, finite-conductivity fracture to a vertical well. This effort had the objective of validating the model through history matching and then of predicting the future performance of the coalbed seam. This effort was unsuccessful. During the 89-months period it has been reported that the cumulative gas production from the 23-well pattern is 2.31 billion scf. That is, about 87% of the original gas in place has been produced in less than 7 1/2 years. 4 figs., 6 tabs.

29696 (INIEX-FOL—6074) **Cracking in concrete support panels due to the force exerted by the thrust pads of a Bouygues tunnelling machine.** van Duyse, H. (INTEX, Liege (Belgium)). Nov 1983. 21p. (In French). INIEX, Liege, Belgium.

This paper explains the background to the problem: the force exerted by the thrust pads of the tunnelling machine can produce cracks in the support panels, particularly when there are cavities between the panels and the rock walls. Describes the arrangement of the thrust pads and panels in some detail and goes on to present the test apparatus devised for an investigation of the problem. Interprets the findings from the seven test runs and concludes that while the cracks never affected the inner surface of the panels, it would prove beneficial to affix a yielding plastic sheet to the pads (as practised on the tunnelling machine at Cadley Hill colliery) in order to prevent load concentration when the cavity between panels and rock lies eccentric to the thrust pad. (In French)

29697 (INIEX-FOL—6377) **Tests on reinforced concrete blocks with embedded inserts.** van Duyse, H. (INTEX, Liege (Belgium)). Aug 1984. 56p. (In French). INIEX, Liege, Belgium.

Due to the success achieved with concrete roadway panels with embedded inserts, Beringen colliery decided to order a second batch for the lining of some 100 m of circular stone-drift. Describes the tests undertaken with concrete blocks having different types of reinforcement. Describes the panels used for the underground trials and the blocks tested in the laboratory. Give details of the compressible inserts (composite wood/wood fibre), the type of reinforcement, the test method and the results obtained (total of 10 blocks tested). Presents an interpretation of the test findings. Gives numerous figures showing the reinforcement structure, the development of fissures and deformation for different types of reinforcement, etc. (In French)

29698 (INIEX-FOL—6378) **All-weather storage of compressible inserts as fixed to reinforced concrete roadway panels.** van Duyse, H. (INTEX, Liege (Belgium)). Aug 1984. 3p. (In French). INIEX, Liege, Belgium.

This report explains the background to the investigation: the increasing degree of mechanisation in the placing of concrete support panels has created a demand for the compressible inserts to be glued in place on the panels. Open-air storage of the 40 mm-thick inserts was a problem which had to be investigated. Examines the weathering ability of the inserts over various periods and how this affected the two types of adhesive used (swelling rate, etc.). Concludes that phenolic adhesive is more suitable in view of the length of open-air storage involved. (In French)

29699 (INIEX-FOL—6379) **Compressive tests on Bullflex bags with different filler materials.** van Duyse, H. (INTEX, Liege (Belgium)). Aug 1984. 22p. (In French). INIEX, Liege, Belgium.

The principal aim of the tests was to assess the behaviour of Bullflex bags, filled with a variety of materials, when inserted in large-volume cavities behind reinforced concrete panels and at the same level as the thrust pads of the tunnelling machine. A second objective was to evaluate the compressive strength of different filler products. Describes the test set-up, the position of the tunnelling machine, the application of stress forces, etc. and lists the nine types of fill product used (synthetic anhydrite, limestone/cement mixes, LIC/grout 66, natural anhydrite, etc.). Presents the test findings and also describes the rupture tests carried out on the Bullflex bags. Discusses the advantages of Bullflex for circular-panel and circular-arch lined roadways and for cavity filling. Includes an assessment of the costs involved. (In French)

29700 (INIEX-FOL—6380) **Behaviour of an initial section of circular stone-drift lined with concrete panels featuring embedded inserts.** van Duyse, H.; van Espen, R. (INTEX, Liege (Belgium)). Aug 1984. 20p. (In French). INIEX, Liege, Belgium.

This report discusses the stability of a 50 m-long section of circular stone-drift which is supported by concrete panels with embedded compressible inserts. Describes the construction of the panels, their dimensions, the layout of the reinforcing bars, the method used for implanting the inserts and the reasons for the choice of the test site. Includes details of stress and deformation measurements in the roadway together with the results of underground observations. Discusses the merits of the compressible-insert method and emphasizes the importance of filling the cavity between the lining panels and the surrounding rock wall. (In French)

29701 (IS-EMRRI—19) **Iowa State Mining and Mineral Resources Research Institute. Final report, July 1, 1982-September 30, 1983.** (Iowa State Univ. of Science and Technology, Ames (USA). Energy and Mineral Resources Research Inst.). Dec 1983. Contract W-7405-ENG-82. 128p. NTIS, PC A07/MF A01; 1; GPO Dep. File Number DE85011356.

The Iowa State Mining and Mineral Resources Research Institute (ISMMRRI) conducts technical research of a substantive nature directed at solving near, intermediate, and long term problems in the development of mineral extraction, characterization, and processing. These activities are supported with funds provided by the Bureau of Mines, US Department of the Interior, under Sections 301 and 302 of Title III, P.L. 95-87, the Surface Mining Control and Reclamation Act of 1977. Technical projects focused on mineral extraction and characterization techniques have been pursued. Several of our current projects addressing impacts of mineral waste management have drawn to a close in the past months as final data have been compiled and analyzed. Some of the promising current projects have addressed better ways to mineral characterization and analysis and have predicted mineral behavior during processing. Other projects have addressed the improvement of mineral processing techniques. Methods of characterization and processing have been tested in laboratory-scale experiments. Further experiments in these areas are being conducted to verify and expand our current data bank. In addition, apparatuses have been developed and field-tested to improve the quality of measuring stresses and testing rock strength in underground mine workings. 9 projects have been entered individually into EDB and ERA.

29702 (IS-EMRRI—19, pp 69-81) **Effects of reclamation methods on groundwater quality and resaturation rates.** Galloway, K.; Lemish, J. Dec 1983. NTIS, PC A07/MF A01. File Number DE85011356.

In Iowa State Mining and Mineral Resources Research Institute. Final report, July 1, 1982-September 30, 1983.

Statistical analysis indicates that groundwater quality on the Iowa Coal Project Demonstration Mine is significantly better than that on the Star Mine for nine of the twelve constituents measured. This quality difference is probably due to differences in mining and reclamation techniques and length of time the spoil was exposed. The ICPDM was mined and reclaimed with scrapers, and reclaimed concurrently, which reduced the amount of time the pyritic material was exposed. The Star Mine, however, was mined and reclaimed primarily by dragline and reclaimed minimally. In addition, the Star Mine was open longer increasing the length of time of oxidation.

29703 (IS-EMRRI—19, pp 87-89) **Effect of nitrogen-fixing growth on restored coal spoil banks.** Kean, J.N.; Schultz, R.C. Dec 1983. NTIS, PC A07/MF A01. File Number DE85011356.

In Iowa State Mining and Mineral Resources Research Institute. Final report, July 1, 1982-September 30, 1983.

Inoculation with mycorrhizal fungi has been shown to improve the establishment of seedlings. This hypothesis is being tested with various kinds of stock by inoculating half of them and leaving the other uninoculated. If natural inoculum exists on the site all seedlings should eventually become mycorrhizal but those that become infected earliest should have greater survival and growth advantage. Since the initial survival is dependent to a large extent on the timing of new root growth and top growth, phenological measurements are being made at regular intervals during the first two growing seasons. Roots systems will be excavated and root development will be related to soil profile characteristics. To date, nearly 63% of the trees planted earlier this year are surviving and are likely to last the duration of the research project. Efforts are underway to distinguish the effects of inoculation with mycorrhizal fungi on the various plots of seedlings.

29704 **(LBL—19552) Characterization of respirable coal mine dust.** Pryor, C.J. (Lawrence Berkeley Lab., CA (USA)). May 1985. Contract AC03-76SF00098. 49p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85013184.

Characterization of coal mine dust was done by thermal evolved gas analysis (EGA), x-ray photoelectron spectroscopy (XPS or ESCA), and scanning electron microscopy (SEM). These analyses were done to determine the chemical, physical, and morphological characteristics of coal mine dust, especially in regard to the differences among dust of differing sources and the changes occurring as these particles are exposed to the atmosphere. The EGA thermograms gave information pertaining to the amount of carbon, hydrogen, and nitrogen evolved from the sample. The CO_2 thermograms of coal dust samples showed that carbon was evolved in two components with different combustion temperatures. The H_2O thermograms showed that hydrogen was evolved concurrently with carbon. The NO/sub x/ thermograms showed that nitrogen was associated with the "aromatic" carbon. ESCA results for laboratory-generated samples showed that coal dust particles contain carbon, oxygen, nitrogen, and sulfur. ESCA was also useful in differentiating between a series of samples from the same mine. The major difference occurred in the C 1s spectra. SEM results of laboratory-generated samples determined the morphology and size distribution of coal dust particles. SEM showed that particles of dust are in the respirable range with some ranging down to the submicron level. The morphology of coal dust particles showed fractured planes with angular shapes. 36 refs., 14 figs., 5 tabs.

29705 **(NP—5750834) Delme project. Final report.** (Swedish State Power Board, Vaellingby). Jan 1984. 86p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. File Number DE85750834.

This report describes a peat mining machine called Torvex XIII, and the properties of the sod peat mined using this so called Delme-method. The peat is treated with a high speed rotating blade which as a result produces peat with a higher content of fine particles than other mining machinery. According to the tests, only 4 percent of the plant structures remain after the treatment. Comparative tests, showed that the Torvex produced peat is drying slower, but more resistant to rewetting and has a higher energy content. The tests show that Torvex can produce sod peat from low-humificated peat. Production figures of 60 m^3 raw peat/h can be reached. The blade is sensitive to stone, metal objects and hard stumps in the bog. The machine is rather expensive, has a larger turning radius and can only be used for peat production, but is still believed to be competitive to other peat mining.

29706 **(STEV-TORV—83-8) Machine system Rejlers for peat production.** Aution, A. (Statens Energiverk, Stockholm (Sweden)). Jun 1983. 36p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. File Number DE85750864.

Final report.

The possiblities to use automated mining techniques for mining peat are studied, i.e. remote control of the mining vehicle with automatic positioning using microcomputers and radar guidance. Using such systems it is estimated that one operator can control three mining vehicles.

29707 **(STEV-TORV—84-3) Full depth method for peat mining. Stage 2.** Tunbraa, L.O. (Statens Energiverk, Stockholm (Sweden)). Jan 1984. 50p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. File Number DE85750844.

The project aims to develop a method to mine peat utilizing conventional contracting machines. After limited mechanical dewatering the drying is made by wind and sun. In this second stage the different parts of the system have been tested in close to full-scale during natural winter conditions. The tests have shown that it is possible to harvest and haul the peat from the surface of the frozen bog without difficulties and with the capacity aimed to, 18000 metric tons dry substance per year by a dry substance dgree of 10 percent in the bog. The further preparation of the peat has indicated that it is possible to dewater the peat to a dry substance content of appr. 20 percent. To achieve this with satifying capacity and economy further development of the equipment is necessary. The equipment for stacking the peat should also be further developed to provide for a higher capacity. The cost of production of peat by the Full-depth-method is calculated to 285 SEK per metric ton of dry substance.

29708 **(STEV-TORV—84-9) System IUC. Optimization of milled peat production.** Larsson, B.; Karlsson, Aa.; Wiksten, L. (Statens Energiverk, Stockholm (Sweden)). May 1984. 62p. (In Swedish). (IUC—1). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750867.

Efficient methods and equipment for production of milled peat are examined in this report. Cost estimates are presented for peat production at a bog exploited by a utility at Skellefteaa in northern Sweden.

29709 **Research on ground stability in underground coal mining.** Markley, R.W. pp 619-629 of Stability in underground mining. Brawner, C.O. (ed.). New York, NY; Society of Mining Engineers of the American Institute of Mining, Metallurgical and Petroleum Engineers (1983). (CONF-820826—).

From 1. international conference on stability in underground mining; Vancouver, BC, Canada (16 Aug 1982).

The predominant methods for mining coal in the USA are room and pillar and longwall. Approximately 95 percent of the coal is mined by room and pillar and 5 percent by longwall. The US Department of Energy (DOE) has an ongoing program to improve the rate, quality, and cost effectiveness of stabilizing the roof for both of these mining systems. In room and pillar mining, the installation of permanent roof support is often the task which paces the system operation, and it thus controls the level of production achieved during any mining shift. Two automatic roof bolt insertion equipment developments are discussed, as well as a flexible drill for operation in thinner seams. Progress will be reported on underground trials of a particular flexible drill which has been combined with a bolt inserter to form a compact, reliable module for retrofitting to continuous mining machines. In longwall mining, the use of hydraulic supports on the working face provides roof stability. The DOE has several trials ongoing with shield-type supports in difficult strata conditions which are described, as well as a cofunded project with the Bureau of Mines on a resin injection remedial method for consolidating a shear zone at one site. A project to improve the match of strata conditions to shield design is also described, which involves the use of a 1360 tonne vertical load mine roof simulator.

29710 **(SMRE-Trans—7253) Geological origins in the prognosis of gas-bearing qualities in coal-bearing strata for the purpose of solving the problems of gas hazard in mine workings.** Zimakov, B.M. (Health and Safety Executive, London (UK)). Sep 1977. Translation source information not available . (HSE-Trans—7253). 21p. NTIS (US Sales Only), PC A02. File Number DE85901522.

The construction of large mines, at deeper levels and with greater intensification of extraction working due to the introduction

BEST COPY AVAILABLE
FOR REPRODUCTION

of high-output machines and high-speed extraction technology, have led to a sharp increase in the level of methane in mine workings, which has a negative effect on the safety of underground work and mine productivity. An important role in maintaining safety during the exploitation of gas-bearing deposits of solid mineral fuels is played by the geological service, whose duties include supplying and the planning organisations with source materials for assessment of the predictable levels and types of gas discharge, so that preliminary measures may be developed at the planning stage to counter gas discharges. Construction and re-construction planning in modern mines is impossible without this geological material on the gas bearing qualities of coal seams and a prognosis of methane levels in the mine workings. The levels of predictable discharges of mine gas in the workings predetermines the cross-section of the main air-channeling drifts, and the parameters of the main fan installations; the necessity of controlling gas discharges in mines affects the choice of extraction systems, the plan for ventilation and industrial degassing of seams, the control of roofs, and the suitability of the extraction of neighbouring seams. The source data for the prognosis of methane intensity in future mines are the results of surveys of coal deposits. The methane intensity in mines being newly constructed, or undergoing fundamental reconstruction, is calculated by the methane-bearing qualities of the coal seams, subject to the standard documents. 3 refs., 3 tabs.

29711 **(SMRE-Trans—7255) Methane emission in workings and some characteristic gas conditions in a brown coal mine.** Minchev, M.; Markov, K.; Nanovska, S. (Health and Safety Executive, London (UK)). Sep 1977. Translation source information not available . (CONF-7710198—14-Trans.; HSE-Trans—7255). 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85901524.

From 17. international conference of mining safety research; Varna, Bulgaria (3 Oct 1977).

The results of the investigation permit the following assertions to be made: in all the development workings there are aerodynamic conditions favourable for the formation of methane layers; that is, the mean velocity of the ventilation flow is usually within the limits 0.15 to 0.30 m/s, and the velocity profiles are characterised by maximum velocities at the floors - sources of methane, forming layers, are usually at a distance of 15-20 to 30-35 m from the face or at the intersections of minor geological disturbance - faults, etc. The intensity of these sources is of the order of 0.2 to 0.5 m^3/min - methane layers are extremely stable and depending on the behavior of the source endure for several weeks, months and in some cases for the whole period of the development of the workings. At the junction of faces with the ventilation roadway, there are regions of complex gassy conditions, manifested by the formation of local pockets of methane and where, in the majority of cases, these is a dangerous explosive concentration of methane. Methane generated from the goaf enters the ventilation flow in the last 5 to 10 m of the face and usually directly into the ventilation roadway. During gas generation in excess of 0.5 to 0.6 m^3/min from the goaf, accumulations higher than 2% are established, and when the gas generation is higher than 1.0 m^3/min, explosively dangerous concentrations higher than 5% can occur. Pockets with methane content higher than 2% have a length of order 7 to 10 m, and with a content higher than 5% have a length of order 3.5 m depending on the aerodynamics at the junction. The thickness of the gas pocket is extremely variable and usually varies within the limits 15-20 to 30-40 cm.

29712 **(SMRE-Trans—6173) Test report for linings for couplings and brakes for use in mining machines for surface and underground workings in which there is assumed to be a fire or explosion hazard due to the possible occurrence of methane/or coal dust/air mixtures.** (Safety in Mines Research Establishment, Sheffield (UK)). 29713 **(DOE/PC/50270—T6) Coal water mixture development. Quarterly technical progress report, first quarter 1985.** (TRW Space and Technology Group, Redondo Beach, CA (USA)). 1985. Contract AC22-82PC50270. 25p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012301.

The first run in the long-term testing phase of the program began January 9, 1985. The purpose of the long-term test phase is to obtain data useful for evaluating the long-term performance of plant equipment, instrumentation, pipe and pipe components in CWM service that performed acceptably during screening test operations. The components being evaluated are those which performed according to engineering design specifications in conjunction with no gross failures directly attributable to CWM service. Thirteen runs were completed during this reporting period. Eleven hundred and seventy-nine hours of equipment performance data were generated using "reference slurry" from the first two shipments produced by Vendor C. Data reduction and evaluation for Slurry No. 5 of the Screening Test Phase were completed. The hydraulic data obtained from tests with this slurry are included in this report. 11 figs., 1 tab.

29714 **(DOE/PC/60789—2) Development and testing of a novel mechanical device for dewatering peat. Quarterly technical progress report, 1 July-30 September 1984.** (Institute of Gas Technology, Chicago, IL (USA)). May 1985. Contract AC22-83PC60789. 10p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012350.

The Internal Rotary Compression (IRC) system concept is suggested by Anderson Metal Industries, Inc. This system has the following potential advantages over current mechanical dewatering devices: (1) Improved peat dewatering achievable due to its ability to apply, simultaneously, compression and shear forces to peat between nonporous surfaces of rolls; (2) reduced unit cost due to small size because rolling surfaces are internal; (3) field-portability permitted by the compactness of the unit reduces operating costs; and (4) a no-slip entry of peat to the pinch area permits gradual compression and maintains unit compactness. In Phase I a bench-scale IRC press was designed, fabricated, and tested. The results obtained from testing the bench-scale IRC press (3-inch diam. outer roll and 2-inch diam. inner roll) have demonstrated that the IRC press can mechanically dewater peat to less than 50 wt % moisture. Approval to begin Phase II of the program was received in July 1984. In this Phase a prototype IRC press (3-ft diam. outer roll and 2-ft diam. inner roll) capable of producing at least 50 lb/h of dewatered peat will be designed and constructed at AMI. The press will be tested at IGT in Chicago to determine the effects of operating conditions on the quality and production rate of dewatered peat. During this first quarter the design criteria for the unit was finalized. All designs and blueprints for the unit have been completed. Preliminary evaluation of the solids feed and retrieval systems have been made. 2 figs.

29715 **(DOE/PC/70796—3) Effect of maceral properties on the comminution of coal. Technical progress report, January 1-March 31, 1985.** Bodily, D.M. (Utah Univ., Salt Lake City (USA). Dept. of Fuels Engineering). 1985. Contract FG22-84PC70796. 3p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85010822.

The swelling of four Utah coals in various solvents of different solubility parameters were measured. The results are listed in Table 1. The samples show swelling up to 50%. The solvents which cause large swelling also extract organic material as evidenced by discoloration of the solvent. No major differences in the swelling properties of the four coals were observed. The coals are all of similar rank, but do show differences in their ease of flotation and in their catalytic hydrogenolysis reactivity. The swelling behavior appears to be more dependent on the chemical properties of the solvent than on the nature of the coal. Four samples from the Pennsylvania State University Coal Sample Bank were separated by the analytical density gradient centrifugation procedure. Hiawatha, Utah coal was selected for studies of induced porosity by freeze drying coals swollen in solvent. The coal was dried and swollen by methanol. Surface areas were measured by CO_2 adsorption at -78°C. The untreated coal showed a surface area of 335 m^2/g. A sample which was swollen with methanol and the methanol removed at 25°C showed a surface area of 226 m^2/g. A sample which was swollen with methanol and the methanol removed at -78°C showed a surface area of 168 m^2/g. The melting point of methanol is -97°C. It was expected that the swollen pore structure might be retained by removing the solvent at low temperatures. 1 ref., 1 tab.

29716 (IS-EMRRI—19, pp 43-64) **Dewatering of coal sludge by pressurized electroosmosis.** Heath, L.W.; Demirel, T. Dec 1983. NTIS, PC A07/MF A01. File Number DE85011356.

In Iowa State Mining and Mineral Resources Research Institute. Final report, July 1, 1982-September 30, 1983.

This investigation showed that electroosmosis can be successfully used to enhance the dewatering of coal sludge. In general, higher voltage gradients led to lower final moisture contents in a shorter time, but at the expense of higher energy consumption. In addition, lower initial moisture contents produced sludges with lower final moisture contents independently of the voltage gradient. In dewatering coal sludge solely by electroosmosis, it was found that the sludge failed to consolidate continually, causing an unsaturated state to develop and heating subsequently occurred. In addition to heating, energy was consumed by electrochemical reactions apparent by the precipitation of calcite in the removed water. The investigation also showed that by combining electrical and hydraulic gradients, lower final moisture contents were obtainable in a much shorter time and that the final moisture content produced by combined gradients was lower than that produced by the gradients individualistically. It was found that when combined, hydraulic dewatering predominated initially and once ceased, electroosmosis continued to dewater the coal sludge. Also, due to the shorter time and higher degree of consolidation produced by the combined ingredients, heating and electrochemical reactions were not as significant.

29717 (IS-EMRRI—19, pp 83-85) **Ground water quality of municipal aquifers downstream from a coal preparation plant.** Osolin, R.L.; Lemish, J. Dec 1983. NTIS, PC A07/MF A01. File Number DE85011356.

In Iowa State Mining and Mineral Resources Research Institute. Final report, July 1, 1982-September 30, 1983.

To date, analyses of collected samples show increased concentrations of sulfate, calcium, iron, and manganese near the beneficiation plant as compared to those found during the original baseline study. Currently, these increases are confined to the shallow ground water beneath the site and have not extended much either laterally or vertically. Monitoring also indicates that the water quality has been nearly stable for the past two years, demonstrating no progressive deterioration. The concentration of contaminants found in the ground water at the site is low as compared to the ranges reported for similar coal storage sites throughout the nation. Analysis of surface water samples also indicates that the receiving streams are able to dilute the surface run-off from the beneficiation plant area to acceptable levels.

29718 **(AD-A—150532/0/XAB) Initial assessment of coal-fired ship operations. Final report.** Baham, G.J. (Baham Corp., Columbia, MD (USA)). Nov 1984. 54p. NTIS, PC A04/MF A01.

This report summarizes recent operational experience of a new generation of ocean-going coal-fired ships. The experience summarized in this report is based upon direct discussions with shipowners, operators, and shipyard as well as data published in the literature. The owners and operators of seven of these new ships give a positive endorsement to the feasibility of coal-fired steam propulsion. They all have had startup problems which will require retrofits to correct. These problems have mainly been with obtaining consistent fuel quality, coal transfer, and ash-handling system operations. In time the operational problems with coal- and ash-handling systems will be resolved through better design and application. The best solution for resolving the coal fuel-quality problems may lie in the development and application of fluidized-bed combustion to marine propulsion. There has been no major loss of revenue or time delays as a result of the problems and all owners indicate they would select coal-firing for future ships in the same trades.

29719 **(DOE/MC/20182—T1) Coal-water mixtures combustion modeling. Final report, 6 May 1983-6 August 1984.** Smith, P.J.; Fletcher, T.H.; Baxter, L.L.; Smoot, L.D. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering). 31 Jan 1985. Contract AC21-83MC20182. 116p. NTIS, PC A06/MF A01; GPO Dep. File Number DE85011488.

The objectives of this study were to develop, evaluate and implement a computer model for describing the combustion of coal-water mixtures for gas turbine applications. This program is intended to assist METC in demonstrating the viability of CWM use in gas turbines, and in understanding and predicting the formation of products of combustion. The study has five tasks; (1) reporting of information and implementing the resulting computer code at METC, (2) modification of an existing model (PCGC-2) to include active mineral matter such as alkali metals, (3) inclusion of water slurry droplets, (4) generalization of the combustor geometry, and (5) extension of PCGC-2 to permit additional feed streams at various locations in the combustor. A modification of the CREE equilibrium routine has been incorporated to permit treatment of some condensed species (i.e., solid carbon and liquid water). PCGC-2 has been extended to allow for water slurry droplet vaporization and dispersion. Initial slurry droplet size information is specified as an input parameter, since no available correlation was applicable to a variety of nozzles. The gas-phase water chemistry was incorporated into PCGC-2 by generalizing the mixing progress variables. This method provides for two mixing variables and three sources of mass input to the combustor (e.g., coal off-gas, air, and water). PCGC-2 has also been modified to permit up to three additional gaseous feed streams into the top or side of the reactor vessel. The code has further been generalized to consider any tow-dimensional geometry, including those geometries with non-uniform shapes. The code has been integrated and calculations have been made for various geometries and for combustion of coal-water mixtures. The new integrated code had been debugged and convergence has been demonstrated for a practical coal-water mixture combustor. 75 refs., 47 figs., 7 tabs.

29720 **(DOE/MC/21233—T1) Evaluation of alternate combustor concepts for gas turbine application program. Monthly report No. 1, October 1984.** (Westinghouse Electric Corp., Concordville, PA (USA). Combustion Turbine Systems Div.). 7 Nov 1984. Contract AC21-84MC21233. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85002699.

This document is the first monthly Technical Progress Report for this project. The objective of this program is to determine the potential for controlling the products of combustion from a slagging combustor burning coal-derived fuels for application to gas turbines. This objective will be accomplished by characterizing the combustor concept and evaluation of the combustor performance through a test program burning coal water mixture and dry pulverized coal fuels. In addition, the impact of the products of combustion from this type of combustor operating on these coal-derived fuels has on conventional gas turbine operation, performance, and maintenance intervals will be evaluated. This 17 month program consists of four technical tasks and one task on program management. The four technical tasks are as follows: Task 1 - facility/combustor preparation; Task 2 - test program; Task 3 - data analysis studies; and Task 4 - system integration. 3 figs.

29721 (DOE/MI/10024—T2) Commercialization of the Staged Cascade Fluid Bed Combustor: a Cooperative Energy Technology Development Program. Final report. (Howard Univ., Washington, DC (USA). Fossil Energy Lab.; Energy and Environmental Engineering, Inc., East Cambridge, MA (USA)). 8 May 1984. Contract FC01-83MI10024. 197p. NTIS, PC A09/MF A01; 1; GPO Dep. File Number DE85010813.

A cooperative venture has been established between a minority university and a minority-owned business enterprise, with the support of the US Department of Energy, to develop and commercialize an advanced concept in fluid bed combustion. This technology, if successfully developed, will permit coal to be burned in US industrial facilities in an environmentaly acceptable manner, at a cost competitive with oil fired steam generators. The technology has a larger application in the generation of steam from coal in utility boilers. The Staged Cascade Fluid Bed Combustor (SCFBC) is an advanced concept in Fluid Bed Combustion developed by personnel at Energy and Environmental Engineering, Inc. and at Howard University. The technology provides the potential for burning coal for steam raising, at a cost competitive with oil fired steam generators, while substantially reducing both sulfur oxide and nitrogen oxide emissions normaly associated with coal fired boilers. Coal is burned in the presence of limestone in fluid bed boilers to capture sulfur oxides released during combustion. The SCFBC has the potential of reducing limestone requirements by half while maintaining the same degree of sulfur oxide control. Preliminary evaluations of the SCFBC show that this system has the potential of generating steam with a 19% savings in capital cost and a 16% savings in operating cost over present generation Atmospheric Fluid Bed Boilers. 20 figs., 25 tabs.

29722 (DOE/PC/30283—T5) Conversion of oil-designed utility boilers to pulverized coal or coal-water mixture firing. Final report. Kimel, E.A.; Kemeny, P.; Fontana, G.; Pinson, M. (Burns and Roe, Inc., Oradell, NJ (USA)). Jun 1984. Contract AC22-80PC30283. 470p. NTIS, PC A20/MF A01; 1; GPO Dep. File Number DE85008518.

The conversion of existing oil fired electric generating units to either dual pulverized coal (PC)-oil or dual coal water mixture (CWM)-oil firing is an option which can result in significant oil consumption reductions. The purpose of this study was to evaluate both the engineering and economic feasibility of the conversion of generating units with only oil firing capability to dual PC-oil or CWM-oil firing and to determine the market potential of such conversions. This report includes a brief introduction, after which the organization is as follows: (1) market potential; (2) retrofit criteria; (3) conceptual designs; (4) economic evaluations; and (5) effects of coal ash content. 29 refs.

29723 (DOE/PC/60809—T4) Alkali atom impact reactions on coal combustion substrates. Quarterly report Nos. 6 and 7, November 15, 1984-June 15, 1985 and March 15, 1985-June 15, 1985. Bennett, J.E. (Arkansas State Univ., State University (USA). Dept. of Chemistry). 1985. Contract FG22-83PC60809. 13p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012800.

Most of the effort since the preceding report has involved attempts to characterize the permeation of graphite walls by K/Na atomic vapors in the range 700 to 1100°C. For this purpose tube furnace experiments, scanning electron microscopy (SEM), and simultaneous Knudsen effusion - quadrupole mass spectrometry have been employed. The most quantitative of these procedures is the latter, and the major part of this report concerned with results from that source. A few results which are considered significant are also described, however, from the tube furnace and SEM experiments. 4 figs., 2 tabs.

29724 (DOE/PC/70764—2-Pt.2) Effect of in-situ heat treatment on coal char reactivity. Part 2. Temperature measurement in flames. Progress report, January 1-March 31, 1985. Essenhigh, R.H.; Shaw, D.W. (Ohio State Univ., Columbus (USA). Dept. of Mechanical Engineering). 23 Apr 1985. Contract FG22-84PC70764. 27p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012330.

Four methods of measuring temperatures in pulverized coal flames are being investigated or developed: (1) the suction pyrometer, which is thought to measure a weighted average of the gas and particle temperatures; (2) two-color pyrometer, primarily to measure the particle temperatures; (3) sodium line-reversal, primarily to measure the gas temperature; and (4) OH peak method in the uv, as a new alternative to sodium line-reversal which may be superior for measuring gas temperatures in the presence of particles. This report describes progress, mainly on development of the first two techniques, and plans now being implemented for development of the last two. 4 refs., 12 figs., 2 tabs.

29725 (IS-EMRRI—19, pp 103-112) Utilization of carbonate rocks and other calcium bearing materials as desulfurization sorbents in fluidized bed combustion. Kaelin, R.A.; Lemish, J. Dec 1983. NTIS, PC A07/MF A01. File Number DE85011356.

In Iowa State Mining and Mineral Resources Research Institute. Final report, July 1, 1982-September 30, 1983.

In reviewing literature pertinent to the state of the art in FBC technology, this research undertakes a three step approach to identify systematically potential problems which may hinder the use of calcium-rich materials as sorbents. The first step is a precombustion strategy which identifies a broader range of those limestones, dolomites, and dolomitic limestones useful as sorbents according to criteria based on previous runs of a known, limited number of calcium-rich materials. These criteria are being developed from trends in combustion efficiency revealed in data from bench- and pilot-scale FBC runs. The second step involves gathering data on the geologic distribution, availability, and transportability of those calcium-rich materials which have the potential to behave as useful sorbents. This includes characterizing those limestones, dolomites, and dolomitic limestones for their intrinsic properties as these properties relate to the performance of these calcium-rich materials in FBC units. The third step addresses the critical problem of treating and handling spent sorbent by methods which can transform FBC waste into a usable product. These three steps are being reviewed in a continually updated, annotated literature survey whicyh is useful as a single source of retrievable information addressing precombustion strategies for identifying sorbents, data on sorbent characterization, and information on handling spent sorbents.

29726 (STEV-FBA—84-5) Pellets as fuel II. A study of methods and ways of development in the combustion of pellets. Schuster, R. (Statens Energiverk, Stockholm (Sweden)). Dec 1983. 61p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750862.

This report describes the second project concerning pellets and is part of a larger work also including peat, straw and reed. It consists of two main parts. The first part gives a base by structuring the methods used for the different combustion-stages. In the second part the methods are exemplified and real units are as a basis for general discussions. Finally, the need for a continued governmental support is identified. This support is recommended to emphasize measurements on/and evaluation of units during and after the development phase in addition to the economical support.

29727 (TNO-MT—83M-013687-RAD-SGE) Corrosion/erosion of materials for AFBC applications; cost 501 Project NL-9. Rademarkers, P.L.F.; Bos, L.; Van Wortel, J.C. (Nijverheidsorganisatie TNO, Apeldoorn (Netherlands). Metaalinstituut). Dec 1983. 35p. Nijverheidsorganisatie TNO, Apeldoorn (Netherlands). Metaalinstituut.

The program comprises the examination of uncooled rings and cooled tubes, which are exposed in the 4 MW atmospheric fluidized bed boiler (AFBB) at Apeldoorn. A description is given of the test facility, the methods and materials and the test conditions. Uncooled rings of several high temperature materials are exposed for various times in the bed, the splash zone and in the free-board. The coal which is burned contains 0.86% sulfur, and limestone is added as sorbent. The first results of metallographic and microanalytical examinations, carried out after exposure of 300, 700 and 1000 hrs, are described. Metal losses of 0.02 to 0.2 mm are observed, the attack in the free-board being more pronounced than in the bed. All exposed materials showed internal sulfidation, and chromium and manganese sulfides are formed. Tests with uncooled rings have been continued, and an additional period of about 1500 hrs has been reached. Cooled test tubes of ferritic boiler steels have been made and placed in the bed and in the free-board, the test temperatures being between 400 deg C and 600 deg C. The cooled tubes have reached operation times of 1000 hrs. The tests have been continued. (In English)

29728 (VTT-TIED—283) **Small district heating plants using indigenous fuels.** Ranne, A.; Ketola, T.; Aeijaelae, M.; Panula, E.; Huotari, J.; Pyykkoenen, M. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Jan 1984. 256p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo (Finland).

The number of small district heating plants using indigenous fuels has grown rapidly in Finland during the last years. Many of these small plants have had many problems beginning district heating supply, related to the plants and their heat production as well as to the other parts of the district heating system: fuel supply system, construction of networks, selection of consumers, organization and the scarcity of resources and knowledge. The study included a one-year follow-up of twelve heating plants with boiler capacities of 1 to 10 MW. The fuels used in the plants were wood chips, sod peat or saw residues. The types of boilers as well as other components and equipment corresponded to the most common types used in Finland. Concerning the fuel supply system, the delivery systems and the characteristics of fuel and ash were classified. The equipment of the plants using indigenous fuels was considered thoroughly by paying attention to failures and lacks as well as to the faultless components. Availability, numbers and outage times due to failures, repairs and maintenance were determined. (In Finnish)

29729 (VTT-TUTK—295) **Process simulation software KATTILA. General routines.** Hallikas, J. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Aug 1984. 57p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo (Finland).

The Domestic Fuel Laboratory at the Technical Research Centre of Finland (VTT) has developed a flowsheeting package for chemical processes. The software is intended for computation of processes in steady state. The special application of 'KATTILA'-software is simulation of boiler plants, for which it is well suitable because of its modularity and flexibility. This part presents the structure of the software and some unclassified routines generally used in the software. The program is a usual modular process flowsheeting package. Tearing streams are computed iteratively using Wegstein convergence accelerator. (5 refs.) (In Finnish)

29730 (VTT-TUTK—296) **Process simulation software KATTILA. Computation of equipment modules.** Hallikas, J.; Vartiala, H.; Miettinen, M.; Asplund, D. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Aug 1984. 56p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo (Finland).

The Domestic Fuel Laboratory at the Technical Research Centre of Finland (VTT) has developed a simulation software for chemical processes. The software is intended for computation of processes in steady state. The special application of KATTILA-software is simulation of boiler plants, for which it is well suitable because of its modularity and flexibility. This part presents the mathematical models for computation of equipment modules. In the package there is in addition to the usual modules, some special modules to compute furnaces, heat exchangers and flash dryers for boiler plants. (9 refs.) (In Finnish)

29731 (VTT-TUTK—297) **Process simulation software KATTILA. Computation of material and flow properties.** Hallikas, J.; Miettinen, M. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Aug 1984. 40p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo (Finland).

The Domestic Fuel Laboratory at the Technical Research Centre of Finland (VTT) has developed a flowsheeting package for chemical processes. The software is intended for computation of processes in steady state. The special application of Kattila-software is simulation of boiler plants, for which it is well suitable because of its modularity and flexibility. This part presents the inputs needed by the software and the instructions of use. (13 refs.) (In Finnish)

29732 (VTT-TUTK—298) **Process simulation software KATTILA. User handbook.** Hallikas, J.; Vartiala, H. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Aug 1984. 98p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo (Finland).

The Domestic Fuel Laboratory at the Technical Research Centre of Finland (VTT) has developed a flowsheeting package for chemical processes. The software is intended for computation of processes in steady state. The special application of 'Kattila'-software is simulation of boiler plants, for which it is well suitable because of its modularity and flexibility. This part presents the inputs needed by the software and the instructions for use. (15 refs.) (In Finnish)

29733 (VTT-TUTK—312) **Simple heat transfer model for shell type boilers.** Holopainen, T.; Asplund, D. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Oct 1984. 74p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo (Finland).

Research has started on handling different kinds of fire-type boilers belonging to shell type boilers, studying the boundary conditions of heat dimensioning. Particular emphasis has been placed on the development of a heat technical dimensioning method based on heat-transfer theory, suiting the boilers in question, which will lend itself to programming on VTT's Cyper 173 mainframe. The results obtained from the model have been compared with available test results and design values. (27 refs.) (In Finnish)

29734 (DOE/EIA—0333(85)) **Annual outlook for US coal 1985: with projections to 1995.** Paull, M.K.; Pantos, E. (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). May 1985. 46p. NTIS, PC A03/MF A01; 1 - GPO; GPO Dep. File Number DE85011973.

Energy Information Administration (EIA) projections of coal supply and use are highlighted and discussed, with special attention given to the factors affecting the future growth of coal use. This report provides a more detailed analysis of the coal forecasts in the EIA's "Annual Energy Outlook 1983" (DOE/EIA-0383(83)). An historical overview is first presented; the emergence of coal (1800-1947), the decline of coal (1948-1973), and the re-emergence of coal (post 1973) are covered. The resource base, technical reliability, and major laws affecting supply and use of coal are also examined. Future trends are analyzed for demand and supply projections for the time period 1985-1995. A comparison with other forecasts is also provided. Factors affecting the outlook for coal are discussed, including leasing, transportation, exports, amendments to the Clean Air Act, synthetic fuels, financial requirements, and availability of certain coals. Concluding comments are also presented. A bibliography is provided. 4 figs., 6 tabs.

29735 (DOE/ET/10532—T23) **Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes. Tenth Interim Report. Revised stock balances and updated cost estimates.** Frumkin, H.A. (Chevron Research Co., Richmond, CA (USA)). May 1985. Contract AC22-76ET10532. 47p. (FE—2315-115). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012359.

Design studies and cost estimates have been published under this contract from 1978 through 1984. While each estimate was based on the best available data and methods at its publication date, cost indices changed and methods were improved with the passage of time. This report revises all the previous results to a common, consistent basis. The overall product yields, overall investments, and per-barrel refining costs summarized in Table 31 are now suitable for use in internal comparisons and any future evaluations where stand-alone synfuel refineries are under consideration. Reforming yield predictions are now based on actual data with coal naphthas. Reforming hydrogen production is higher than had been originally estimated, allowing smaller hydrogen plants and, hence, lower costs especially in the all-gasoline cases. Because of the above change, making all-gasoline is no longer clearly more expensive on a volume basis than making kerojet and gasoline, as had been previously concluded. Costs for the two product slates are now closer together and the most economic product slate is feed-dependent. 8 refs., 31 tabs.

29736 **(DOE/PE—0073) Effects of railroad regulatory reform on coal and electricity. Draft.** (USDOE Assistant Secretary for Policy, Safety and Environment, Washington, DC. Office of Coal and Electricity Policy). May 1985. 210p. NTIS, PC A10/MF A01; GPO Dep. File Number DE85012362.

The results to date of a study started in mid-1984 to determine how rail transportation policies are affecting United States coal markets and electricity support the following conclusions: "Partial rail deregulation" is not now inhibiting the US from providing adequate supplies of utility coal. The basic principles of differential pricing, endorsed by the Staggers Rail Act of 1980, appear to be contributing to the improved operational and financial health of the nation's railroads. Although no modification to the Staggers Act is suggested here, some regulatory "fine tuning" is in order to balance the requirements of an efficient free enterprise system with the needs of those utility coal shippers who are vulnerable to monopoly abuse.

29737 **(NP—5750832) Government bill 1983/84:158 concerning certain coal topics.** (Energidepartementet, Stockholm (Sweden)). Mar 1984. 102p. (In Swedish). NTIS (US Sales Only), PC A06/MF A01. File Number DE85750832.

This government bill contains guidelines for the steam coal consumption in Sweden up to 1990. A moderate increase of the coal consumption to some 3-4 M tons/year is planned. This represents a reduction by 1/3 compared to level recommended by the parliament 1981. The erection of new plants is controlled by an application procedure, compulsary for coal fired district heating centrals, and local heating centrals above 0.5 MW. This restriction is not applied to industrial plants situated outside district heating or natural gas distribution areas. New standards for emmission of sulfur are also proposed; for large plants with yearly emissions above 400 tons, an upper limit in the interval 0.05-0.10 g sulfur/MJ coal consumed is suggested and for smaller plants an upper limit of 0.10-0.17.

29738 **(VTT-TIED—270) Fuel use of coal. Part 1. Preliminary study.** Mutanen, K.; Kallio, M.; Micttinen, M.; Okkonen, J.; Vesterinen, R. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Jan 1984. 159p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo (Finland).

The report presents the coal resources of the world, coal consumption and trade, Finnish import and use of coal, and the properties of coal. The techniques of production, handling and use of coal are surveyed. The developing requirements for coal which are most important to Finland are reviewed. Chemical refining of coal is not included in this report. The object of this report is to give basic information of coal to people working in coal use or research and to authorities working with coal. (66 refs.) (In Finnish)

29739 **Enhanced coal technology. Hearing before the Subcommittee on Energy and Mineral Resources of the Committee on Energy and Natural Resources, United States Senate, Ninety-Eighth Congress, First Session, August 9, 1983.** Washington, DC; Government Printing Office (1985). 465p.

The future market for coal brought 25 witnesses to a field hearing in Blacksburg, Virginia. The witnesses represented the Export-Import Bank, DOE, electric utilities, the International Energy Agency, manufacturers, railroads, and other parties concerned with unemployment in the coal-mining regions and the economic opportunities that would result from expanded coal use and trade. There was an emphasis on the importance of coal to the economy and well being of the state, as well as on the importance of using the latest technology for mining, transporting, and using coal in order to protect the environment. A policy of government-industry cooperation could help to improve the stagnant growth of the coal market. An appendix with additional material submitted for the record follows the testimony.

29741 **(CONF-8505141—1) Functional form analysis of the short-run demand for travel and gasoline by one-vehicle households.** Greene, D.L.; Hu, P.S. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 23p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011932.

From The Institute of Management Sciences/Operations Research Society of America meeting; Boston, MA, USA (1 May 1985).

The short-run elasticity of vehicle travel and gasoline demand is analyzed using gasoline purchase diary data for households in the US owning one vehicle. A Box-Cox method (iterative ordinary least squares) is used to determine best functional forms for each of four income quartiles in the sample. All income groups' transformation parameters are found to be close to 0.4. Thus, price elasticity increases with increasing fuel prices. Elasticity estimates at the mean for the three upper quartiles are -0.6, and that for the lowest quartile is approximately -0.5.

0201 Reserves

REFER ALSO TO CITATION(S) 29754

29742 **(RAND/N—2049-DOE) Linking US oil and gas reserve estimates.** Nehring, R. (RAND Corp., Santa Monica, CA (USA)). Sep 1984. Contract AC01-80PE70271. 196p. NTIS, PC A09/MF A01; GPO Dep. File Number DE85012399.

During the past decade, two reports on United States oil and gas reserves have been published: (1) the combined annual reports of the Committee on Reserves of the American Petroleum Institute (API) and the Committee on Natural Gas Reserves of the American Gas Association (AGA) for the years up to and including 1979, and (2) the annual reports of the Energy Information Administration (EIA) of the Department of Energy for the years beginning in 1977. These two series do not agree on either the total reserve estimates or the annual changes in reserves. The purpose of this note is to provide an informed, plausible series of proved reserves and annual reserve changes by type for crude oil and natural gas (dry) that links these two different series of reserve estimates over the late 1970s. Section I describes the basic differences between the two published series of reserve estimates, explores the possible reasons why differences between the two series occurred, and describes the approach we followed in creating a linked series. Section II presents the published and linked estimate of crude oil reserves, reserve changes by type, and production for the 43 individual states and statistical subdivisions for which crude oil reserve data have been published. Section III presents the published and linked estimates of natural gas reserves, reserve changes by type, and production for the 41 individual states and subdivisions for which natural gas reserve data have been published. Section IV provides aggregate estimates of crude oil and natural gas reserves for the United States as a whole. 8 figs., 100 tabs.

29743 **(USGS-OFR—83-559) Estimated oil and gas reserves, Southern California Outer Continental Shelf, December 31, 1982.** Ballantyne, R.S. (California State Univ., Hayward (USA)). 1983. 10p. US Geological Survey, Box 25425, Denver Federal Center, Denver, CO 80225. File Number TI85901596.

Remaining recoverable reserves of oil and gas in the Outer Continental Shelf off Southern California are estimated to be 968 million barrels of oil and 1,851 billion cubic feet of gas as of December 31, 1982. These reserves are attributed to 14 fields. Original recoverable reserves from these fields are estimated at 1,217 million barrels of oil and 1,983 billion cubic feet of gas. The estimates for both the remaining and the original recoverable reserves of oil and gas are higher than the corresponding estimates for December 31, 1981. Reserve estimates for 12 fields were based on volumetric reservoir studies. Decline-curve and volumetric analyses were used for the remaining two fields. Six fields were on production at year's end and a gas field is scheduled to commence production in 1983. 5 refs., 2 figs., 1 tab.

0202 Geology And Exploration

REFER ALSO TO CITATION(S) 29805, 31137

29744 **(ANL/ES—146) Geology and petroleum resources of basins in western China.** Ulmishek, G. (Argonne National Lab., IL (USA)). Nov 1984. Contract W-31-109-ENG-38. 137p. NTIS, PC A07/MF A01; GPO Dep. File Number DE85013038.

Western China contains 11 recognized petroliferous or potentially petroliferous basins. Despite their great difference in size, these basins have important common features: (1) their Mesozoic-Cenozoic sedimentary sequences are composed of rocks of essentially terrestrial origin, and (2) they experienced predominantly compressional stress during the late stages of their geologic history. The report is structured on a regional basis. The topics discussed for each basin include the stratigraphic and lithologic composition of the sedimentary cover, the major stages of tectonic development and the present-day structural framework, known oil and gas fields, probable source rocks, reservoir rocks, traps and seals, and potentially important exploration plays. The basins occupy 800,000 km^2 of land and contain over 4,000,000 km^3 of prospective sedimentary rocks. The most probable amounts of undiscovered petroleum resources in all these basins are estimated at 19.5 billion barrels of oil and 78 trillion cubic feet of gas. The Tarim, Zhungaer, and Chaidamu basins possess the great majority of these resources. 111 refs., 48 figs., 9 tabs.

29745 **(DOE/METC—85/0219) Arctic and offshore research. Technology status report.** (USDOE Morgantown Energy Technology Center, WV). Oct 1984. 32p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85001995.

The DOE Arctic and Offshore Research (AOR) effort is designed to meet the needs for a centralized, high-quality, Arctic energy-related data base and for long-term, high-risk research. The ultimate purpose of the DOE effort is to promote extensive private use of the evolving AOR technology data base in order to accelerate development of Arctic oil and gas resources. In assessing the Arctic energy-related research needs as delineated in this report, the Morgantown Energy Technology Center (METC), with the DOE Fossil Energy Office of Oil, Gas, and Shale Technology, developed the following activities: AOR Energy-Related Technology Data Base Development; AOR Seminars and Workshops; Arctic and Offshore Energy Research Coordination; Sea Ice Research; Seafloor/Soils Research; and Subice Systems Development. The DOE AOR effort was initiated in FY 1983, the early development activities were performed in January and February 1983, and the effort evolved to its present form by the conclusion of FY 1984. The current activities have included determining the Arctic bibliographic data base and initiating most pieces of the research described above (except multiyear ice properties and pipeline research). Some of the FY 1984 major accomplishments are: four to five ice islands 1 to 2 miles in length drifting off the Ellesmere ice shelves north of Ellesmere Island were aerially surveyed. A report was completed on the location of the ice shelf edge, breakup, and regrowth of the Ellesmere ice shelves over the past two decades. Ice-ridging shear zone studies have shown that the 6- to 10-feet high shoals usually under the shear zone are not totally destroyed from ice gouging from one year to the next, but that the ice gouging may be instrumental in initiating and maintaining the shoals, which may protect Arctic offshore structures. Airborne radar sensing techniques were used to determine the electromagnetic properties of sea ice and physical properties.

29746 **(NIPER—20, pp 23-32) Surface chemistry of reservoir rocks and their reaction with crude oil components.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122. Contract FC03-83FE60149.

In NIPER annual report, 1984.

A research study was conducted to delineate the nature of reservoir rock-fluid interactions. Work concentrated on determining the physical, surface, and chemical properties of a series of carbonate and sandstone reservoir cores. This basic work is an essential part of overall reservoir characterization, and is valuable input for the design of EOR processes. A number of analytical techniques were used to define the physical and chemical properties of the sandstone and carbonate reservoirs. Energy dispersive x-ray spectroscopy analyses supported by scanning electron microscopy observations indicated the presence of clays and clay minerals in three distinct morphologies in sandstone samples. Bulk chemical composition of the sandstones, as determined by inductively coupled plasma spectroscopy, differed considerably from the surface composition indicating more reactive elements were present on the sandstone surface. The surface analysis of carbonates was generally no different than the bulk analysis. Cation exchange measurements on the sandstones using a whole core method were more indicative of the potential of a reservoir to react with EOR chemical than the standard method using crushed core samples. X-ray diffraction was used to identify and quantify the clays in the sandstones; the carbonates generally contained only traces of clays as compared to as much as 11.8 wt. percent for the sandstones. Berea sandstone showed a large difference in wettability between the whole oil and a polar compound fraction of the oil. It also showed large differences in wettability depending on the composition of the polar fraction. Gas chromatography/mass spectroscopy (GC/MS) analysis of the polar compound fractions indicated considerable hetero-compound character.

29747 **(NIPER—20, pp 33-42) Effect of clay minerals on oil saturation determination.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

A research program was undertaken to determine the effects of formation variables such as clay content, brine concentration, and oil gravity on the determination of residual oil saturations in heavy oil reservoirs. Oil saturations were determined using standard laboratory techniques for evaluating fluid saturations in the heavy oil cores. Samples were acquired from three heavy oil reservoir formations: Bartlesville (KS), Rimrock (UT), and Big Clifty (KY). A unique situation was presented by the Big Clifty samples since natural state, fireflooded, and pre- and post-steamflooded samples were available. Special attention was given to the effects of these floods on the alteration of formation clays. The visual and chemical analyses of the clays found in the Big Clifty pre- and post-flood samples indicated that the floods did not alter the clays significantly in the core samples. Laboratory oil saturation measurements by three different methods indicated good agreement on the better preserved samples. Water saturations as determined by visual observation during centrifuge displacement tests were less than those values determined by resistivity measurements. These higher values by the resistivity methods were attributed to the secondary properties of the rock/fluid system and specifically in this case the clay content. The resistivity values were found to increase in proportion to an increase in clay content. The increase was more pronounced in the heavy oils as compared to the light oils.

29748 (NIPER—20, pp 43-51) **Three-phase flow in porous media.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

A thorough literature search was performed to define the state of the art of different laboratory techniques available for measuring three-phase relative permeability. The search showed that the study of three-phase flow phenomena has been largely neglected because of the many complexities involved in the laboratory tests. One of the biggest difficulties encountered is to monitor laboratory fluid saturation profiles. Several methods for laboratory saturation measurement; such as x-ray absorption, γ ray absorption, and microwave absorption have been used successfully to determine fluid saturation distribution in core samples during laboratory floods. The x-ray and microwave absorption techniques will be used in this research to determine reproducible and accurate oil and water saturations, respectively. Two-phase relative permeabilities of two different fluid systems were measured. A conventional experimental setup has been used to measure this property. The equipment is identified as conventional since only volumetric and gravimetric techniques could be used to determine fluid saturation. The two-phase relative permeability data are necessary in the theoretical determination of three-phase relative permeability using a modified Stone's equation. The validity of this equation will be checked using three-phase relative permeability data obtained with the computer-controlled x-ray/microwave system.

29750 **(DGRST—81-D-0092) Solubilizing power of surfactants and interfacial properties of middle phases linked to enhanced oil recovery.** Lachaise, J.; Graciaa, A. (Delegation Generale a la Recherche Scientifique et Technique (DGRST), 75 - Paris (France)). Dec 1982. 261p. (In French and English). NTIS (US Sales Only), PC A10. File Number DE85751353.

Brine/oil/surfactant/alcohol systems comprise 2 or 3 phases, the surfactant-rich phase is called microemulsion for a two-phase system or middle phase for a three-phase system. Middle phases are of great interest for enhanced oil recovery because they can solubilize simultaneously large amounts of oil and brine and interfacial tension with other phases are low enough to improve recovery of residual oil trapped in deposits. Contribution to low surface tension of middle phase measurement by light scattering, formation of two-phase or three-phase system, influence of surfactants on middle phase, partition of non-ionic surfactants between water, oil and micellar phase and influence of partition on efficiency of commercial surfactants are examined.

29751 **(DOE/ET/13077—105) Commercial scale demonstration: enhanced oil recovery by micellar-polymer flood. Seventh annual report, October 1983-September 1984.** Mueller, L.M. (Marathon Oil Co., Findlay, OH (USA)). May 1985. Contract AC03-78ET13077. 83p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85000128.

Information in this report is presented under three Work Breakdown Structure (WBS) elements: WBS 2100 - fluid injection; WBS 2300 - performance monitoring; and WBS 2400 - economic monitoring. WBS No. 2100 - Fluid Injection: (1) Polymer injection was completed in the 2.5-acre pattern while injection continues at a concentration of 625 ppM in the 5.0-acre pattern. Polymer concentration at the 2.5-acre pattern was reduced from 100 ppM to 50 ppM and then, upon completion of polymer injection, from 50 ppM to fresh water. (2) Copper coils are used to reduce injection rates at the M-1 because the coils can reduce wellhead pressure and still minimize the shear degradation of the polymer. WBS No. 2300 - Performance Monitoring: (1) Presently, the 2.5- and 5.0-acre patterns are producing at oil cuts of 2.7% and 8.6%, respectively. (2) The annual transient test results for the six injectors and their six offset producers are reported. The results are compared to previous years' results and indicate little change in mobility and skin factor over the past year. (3) Subsequent to injection of tritiated water into ten injection wells, all producing wells have been analyzed regularly for the presence of tritiated water. A discussion of the directional flow trends determined from tritiated water analysis is reported. (4) Samples of produced fluid are analyzed regularly for water soluble sulfonate content (a micellar slug component). An analysis of samples taken in June, 1984, shows 81 2.5-acre wells (89%) and 39 5.0-acre wells (95%) with sulfonate levels above background levels. (5) The M-1 biocide was switched from Tretolite XC-215 to Tretolite SC-510 in November, 1983. WBS No. 2400 - Economic Monitoring: (1) An economic analysis of the M-1 Project indicates that the production, investment, and expense which occur after 1983 do not significantly affect project economics. 19 figs., 6 tabs.

29752 **(DOE/METC—85/0221) Gas-miscible displacement: enhanced oil recovery. Technical status report, October 1, 1983-September 30, 1984.** (USDOE Morgantown Energy Technology Center, WV). Jan 1985. 23p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85001997.

The general goal of the Gas-Miscible Displacement Project is to support high-risk, long-term carbon dioxide/enhanced oil recovery (CO_2/EOR) research which does not duplicate or displace private or other public research and development (R and D) efforts in CO_2/EOR. More specifically, the project goals are to: understand displacement mechanisms of the CO_2/EOR process; provide predictive capability to forecast recovery from the CO_2/EOR process; and improve the CO_2/EOR process recovery efficiency. In order to accomplish these goals, the following research priorities have been identified: better mobility control of injected fluids; improved reservoir evaluation techniques through investigation of geologic and reservoir heterogeneity, residual oil saturation, and fracturing; improved understanding of oil swelling, viscosity reduction, and extraction/vaporization phenomena; improved predictive modeling; and field performance appraisal for tertiary oil recovery. Objectives of the research for fiscal year (FY) 84 and FY 85 are to complete the following: develop mobility control technology for improving the reservoir sweep efficiency of the gas flooding processes, develop gas flooding simulation research to provide acceptable levels of process predictability for adequate evaluation of economical and technical risks; develop phase behavior and displacement research activities to provide fundamental data on the processes that characterize and control macroscopic and microscopic oil recovery in gas flooding; develop novel concepts that will result in more efficient use of CO_2 and improved oil recovery; and demonstrate gas flooding technology through field testing of concepts demonstrated in laboratory and modeling studies. 2 tabs.

29753 **(DOE/SF/01424—T7) Multi-pattern low-tension demonstration flood, Big Muddy field. Technical progress report, January-March 1985.** Painter, T.R. (Conoco, Inc., Casper, WY (USA)). 1985. Contract AC03-78SF01424. 19p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011201.

The injection of the polymer-pusher slug continued through the first quarter of 1985. A power failure on February 9, 1985, caused a half-day plant shutdown, and the start-up of the plant on the next day resulted in a minor pump problem in the polymer-mixing stage. Approximately 1100 barrels of high-viscosity polymer slop had to be disposed of, but normal plant operations were quickly restored. A total of 1,393,200 barrels of polymer-pusher slug has been injected through March 31, 1985, which is approximately 80% of the planned slug size. Project injection was 629 BPD in March, down from 1136 BPD in December due to another intentional rate cut-back. This cut-back was also made to eliminate pressure-parting, and individual well injection rates were revised according to step-rate parting tests run in November. Oil production fell from 119 BOPD in December to 85 BOPD in March. Most of the decrease was due to an intentional production cut-back to match the injection cut-back, thus maintaining pattern balance. February production was low due to an estimated 780 barrels of bad oil in storage, which will be treated and sold in April. January production was high by 420 barrels of oil due to a LACT pump failure in late December. The March production of 85 BOPD was a reasonable measure of the actual oil rate for the project. Cumulative project production was 217,178 barrels of oil as of March 31, 1985 (sales only). Sulfonate was produced in all wells with Well 88 showing the highest level in the oil (1875 ppM). The production-weighted average remained at 350 ppM. The auxiliary treating facility, with the exception of one upset due to an attempt to remove a high iron-sulfide pad from the treater and FWKO's, continued to achieve merchantable oil. 6 figs., 4 tabs.

29754 (NIPER—20, pp 53-57) **EOR national potential.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

As a first step in determining the impact of including reservoirs with less than 50 million barrels of original oil in place (OOIP) on predicting the National EOR potential, data were collected on over 600 oil reservoirs containing between 20 and 50 million barrels of OOIP. Data were also collected for about 400 reservoirs containing over 50 million barrels of OOIP. Some of these may be duplicate reservoirs, however these sources may contain pieces of information missing in the data base. A separate task of this subproject was to determine the potential of applying EOR technology to abandoned wells. Our data showed that over 90% of the abandoned oil fields in the US are not a viable enough EOR target to justify the effort required to add them to the Department of Energy's reservoir data base.

29755 (NIPER—20, pp 59-64) **Technology appraisal.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Information on 225 EOR projects has been collected for DOE's EOR project data base. These data indicate that polymer flooding (76 projects) is the most popular EOR process started in the 1980's followed by steamflooding (29 projects), carbon dioxide immiscible (15 projects), and carbon dioxide miscible (12 projects). Other EOR processes averaged less than one project per year over this period.

29756 (NIPER—20, pp 65-76) **Process predictive screening models.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

DOE's process predictive models were studied and their sensitivities to input parameters was determined. The chemical flood model was improved by correcting errors and adding provisions for line drive and seven-spot injection patterns. This model is very sensitive to pattern size, surfactant slug size, and permeability. For the steamflood predictive model several errors were corrected and the four algorithms evaluated. The Gomaa algorithm gave the best match to field data, while the Intercomp algorithm was the most flexible and had more realistic sensitivity to input data. Two of the DOE's cost-shared projects were selected for more detailed study using finite difference simulators. The projects were the North Burbank Chemical Flood and the Bodcau In Situ Combustion.

29757 (NIPER—20, pp 87-93) **Behavior of surfaces with adsorbed materials.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Electrophoretic mobilities were measured on natural and homoionic (sodium) kaolinite before and after adsorption of sodium octylbenzene sulfonate, sodium dodecylbenzene sulfonate, and a sodium alkyldiphenyl ether disulfonate, over a range of pH values from 4 to 11. A correlation was found between adsorption and zeta potential for each adsorbate. The potential utility of the results is examined.

29758 (NIPER—20, pp 95-104) **Adsorption of surfactant slug chemicals.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

In the first part of this report, the interaction of alcohol cosurfactant with solid surfaces was studied. A relationship between the interactions with water-wet and with oil-wet surfaces and chain length of alcohol is reported. In the second part, the interactions of surfactants with different surfaces were taken up. The general conclusions are that water-wet surfaces interact more strongly with surfactants dissolved in hydrocarbons than those dissolved in water. Oil-wet surfaces have a higher interaction with surfactants in water, even with ionic surfactants. The third section describes preliminary work with polymers, and suggests that flow adsorption calorimetry with the LKB system is a contradicted technique for this study.

29759 (NIPER—20, pp 105-110) **Application of thermodynamic measurements to micellization and solubilization.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Thermodynamic property measurements have been made for sodium octylbenzene sulfonate (SOBS) in water and for n-pentanol in mixtures of SOBS + water over a range of concentrations at 303.15 K. Enthalpies of dilution, heat capacities, and densities were measured. Relative apparent molal enthalpies, apparent molal heat capacities, and apparent molal volumes were calculated as a function of concentration from the experimental data. The results were fit with a model for the thermodynamics of ionic surfactant solutions developed during the previous year. The model was extended to include expansibilities and compressibilities for surfactants in aqueous solutions. Modifications were made to the model to consider effects of added electrolyte on the properties of surfactants in water. The results provide new and useful insights into the behavior of alkylbenzene sulfonates in solution.

29760 (NIPER—20, pp 111-120) **Effects of surfactant structure on micelle formation and solubilization.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Thermodynamic property measurements have been made for 2-butanol in aqueous solutions of sodium octylbenzene sulfonate (SOBS) at 303.15 K. Heat capacity and density measurements were made as a function of the concentrations of both 2-butanol and SOBS. Solubilities of n-butanol, i-butanol, 2-butanol, n-pentanol, and i-pentanol were measured in aqueous solutions having varying concentrations of SOBS. The solubility of 2-butanol in aqueous solutions of two isomers of dodecylbenzene sulfonate and in sodium dodecyl sulfate were also determined. Comparison of the results with those obtained under project BE4C for n-pentanol in aqueous solutions of SOBS provides some useful insights into the role of surfactant and cosurfactant structure in solubilization. Small angle x-ray scattering was used to obtain distance distribution functions in emulsions formed with two nonionic surfactants and three oils (hexadecane and two asphaltic crudes).

29761 (NIPER—20, pp 121-126) **Order of mixing effects for aqueous surfactants.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Measurements of capacitance and conductance for different orders of mixing have been completed for two petroleum sulfonates, Amoco Floodaid 141 and Witco TRS 10-410. The results are consistent with microscopic observations, and increase our understanding of the structure of these solutions.

29762 (NIPER—20, pp 121-138) **Gas displacement methods.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

The project has two parts, one related to the enhanced recovery of heavy oil by CO_2 injection and the second related to light oil recovery by nitrogen injection under miscible conditions. In the first part of the project, measurements were made on two heavy crude oils, namely, Bartlett (Kansas) and Merey (Australia). The measurements included effects due to CO_2 dissolution on viscosity reduction, density change and crude oil swelling. From measurements of CO_2 dissolution in heavy crude oil it was found that the viscosity is monotonically decreased with an increase in CO_2 saturation (representing higher pressures). A method for predicting viscosity of heavy oil and CO_2 mixtures is being developed. Also, the variation of heavy crude oil viscosity with changes in pressure and temperature was determined. In the second part of the project, equipment and apparatus were constructed to provide means for measuring the phase behavior of nitrogen and light oil mixtures, and the minimum pressure by nitrogen injection required to achieve miscible displacement of light oil from a slim-tube packed with fine-grained solid material to simulate a porous medium. The apparatus was designed to be operable when used for simulating normal oil reservoir pressures and temperatures. A series of laboratory slim-tube flooding tests were conducted displacing a 37.9° API Oklahoma City Field (Prue) crude with nitrogen with pressures up to 6000 psi at a reservoir-simulated temperature of 160° F. The minimum miscibility pressure (MMP) was not reached.

29763 (NIPER—20, pp 159-172) **Reservoir characterization for EOR application.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

To monitor the progress of a fluid front during an EOR operation the feasibility of applying one or more surface or borehole geophysical tools was investigated. Due to the rapid advances made in recent years in the acquisition, processing, and display of seismic data, it may be concluded that EOR processes where there is injection or generation of gas will be relatively easy to monitor by high resolution seismic techniques because of sharp changes in acoustic impedance brought about in these processes. However, the acoustic impedance changes in the chemical EOR process are expected to be much smaller and rigorous experimentation is required to find if a stable slug of air or nitrogen foam could be injected at some point in the chemical flood to artificially lower the acoustic impedance so that a chemical flood front can be monitored seismically. The sharp changes in resistivity along the chemical flood can provide enough contrast for such processes to be monitored by one of the suitably modified electromagnetic devices. All surface measuring electrical and electromagnetic devices have a depth limitation due to various types of noise and the only way to circumvent this problem will be to lower the excitation electrodes inside the boreholes and measure the perturbing fields on the ground surface or in another borehole.

29764 (NIPER—20, pp 173-184) **Improved chemical flooding agents: surfactant systems.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Surfactants of high disulfonate content were found to behave in a manner not fully ascribable to low equivalent weight. They exhibited some cosurfactant character. Calcium appeared to be associated with the disulfonate in transport between phases. One biosurfactant examined was effective in mobilizing oil at low salinity and low pH without a cosurfactant.

29765 (NIPER—20, pp 185-194) **Mobility control agents.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Screen factors of P-500 differed from shear viscosity in the following ways: 1) flow resistance increased with flow rate; 2) concentration dependence decreased at higher concentration; and 3) increasing salinity caused a greater departure from Newtonian behavior. Surfactant/crude oil and caustic/crude oil systems were found that gave stable macroemulsions at 110°C. Oil-in-water emulsions were formed at the low salinities expected in steamfloods. They caused stable blocking of flow when injected into Berea cores.

29766 (NIPER—20, pp 195-204) **Alkaline flooding.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

In a three phase project, work was initiated on alkali-mineral interaction, alkali-oil interaction, and alkali-polymer interaction. Representative minerals were prepared in standard reference condition and characterized for cation exchange capacity. In tests of the effect of carbonate and bicarbonate on emulsification-demulsification of several heavy crudes, it was found that bicarbonate promoted favorable behavior. Alkaline conditions slightly decreased the intrinsic viscosity of a polyacrylamide, but its viscosity was increased at concentrations typical of a mobility buffer slug.

29767 (NIPER—20, pp 205-220) **Steamflooding.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

The use of the steamflooding EOR process to recover light crude oils was investigated. The results of coreflooding experiments suggest that light crude oils can be successfully recovered using steamflooding. Ultimate oil recovery was independent of initial fluid saturations, injected steam quality, steam injection rate, pressure drop across the core, and core permeability. Ultimate recovery decreased as the concentration of polar compounds in the crude oil increased. These preliminary experimental results indicate that distillation is the primary displacement mechanism when steamflooding is used to recover light crudes.

29768 (NIPER—20, pp 221-230) **In situ combustion.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

The effect of vanadium, nickel, and iron on processes which occur during in situ combustion has been investigated. Combustion and cracking reactions were examined using thermoanalytical techniques. The metals were added in soluble form to natural heavy crude oil. The presence of these metals has a catalytic effect by increasing the amount of coke deposited, decreasing the temperature of combustion, and increasing the amount of heat given off by the combustion. The quantity of coke deposited is significant because it would influence the amount of air required by the process and therefore the economics of the process. Lowered combustion temperature and increased heat of combustion could affect the ignition of the reservoir hydrocarbons and the ability for the combustion to sustain itself.

29769 (SGP-TR—82) **Velocity and gravity effects in relative permeability measurements.** Beal, B.A.; Nunes, C.S. (Stanford Univ., CA (USA). Stanford Geothermal Program). Jun 1984. Contract AT03-80SF11459. 154p. NTIS, PC A08/MF A01; 1; GPO Dep. File Number DE85009925.

There have been several studies on the effects of gravity and flowrate on laboratory relative permeability measurements. Most of these studies have concentrated on the effect of these parameters on the flooding front. Miller's (1983) data showed that the influence of these and other variables are not understood. The study found that the calculated recovery at breakthrough was different than the observed recovery at breakthrough. The calculated recovery at breakthrough was based on theory derived from Buckley-Leverett piston-like displacement. This study attempted to determine how gravity or core positioning and flowrate of the displacing fluid might be used to achieve a stable flooding front. A relative permeameter with unsteady-state flow was used for the apparatus. The core material was an unconsolidated silica sand. The core was 2 in. in diameter and 20 in. long. The fluids were refined white mineral oil and salt water. All measurements were done at room temperature. This study found that gravity had no significant effect on the difference between calculated and observed recovery at breakthrough. It also observed that an increase in flowrate would increase the flooding front instabilities. Therefore as flowrate decreased the calculated and observed breakthrough approach a single value. 23 refs., 56 figs., 25 tabs.

29770 **Enhanced oil recovery. Lovington steam test goes down as a silent roaring success.** Calhoun, J. *Drill Bit;* **30**: No. 4, 89-90(Apr 1981).

A recent down-hole steam generation test conducted near Lovington, New Mexico by Sandia National Laboratories was a success. The experiment was a mock-up using a simulated generator with exact weight and dimensions of the real thing. The mock generator is 40 ft long and weighs 1500 lb. The next test, using the real thing, will involve a generator only 3 ft long. The test was the second in a series of 3. The first near Bakersfield, CA, utilized the steam-gas mixture to be generated by the devices, but pumped down hole from above ground. This test proved the feasibility of lowering the largest-envisioned steam generator into the well, along with peripheral equipment.

29771 **DOE report examines enhanced oil recovery constraints.** *Oil and Gas Journal;* **78**: No. 17, 105-117(28 Apr 1980).

A critical examination of the potential - and the technical constraints that inhibit application - of enhanced oil recovery (EOR) techniques in the US has been initiated. The examination is based on the results of extensive lab and field applications now underway under various types of US Department of Energy (DOE) support. Interim Rep. No. 1 Technical constraints limiting application of enhanced oil recovery techniques to petroleum production in the US., will be amplified as data become available and progress is made. The target for EOR methods is more than 300 million bbl, but all of this oil cannot be recovered even with the techniques being developed today. While recovery potential is uncertain, various studies estimate that from 20 to 50 billion bbl of that remaining may be produced using advanced recovery techniques. The DOE report states that the largest potential recovery will be realized from the 2 techniques furthest from large-scale, commercial application - miscible and chemical recovery. Highlights of the study's discussion of the technical constraints to the application of chemical recovery, miscible gas recovery, and thermal recovery processes are presented.

0204 Processing

29772 (NIPER—20, pp 251-274) **Stability and processing research for crudes, intermediate and process streams and finished fuel.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

The intent of this project is to demonstrate that one can predict refinery products quantities and qualities based on knowing in detail the composition of the feedstock and the upgrading conditions, even for very heavy, low quality crudes. While the correlations may be very different from those for light, sweet petroleum, it is postulated that satisfactory relationships can be derived given sufficient data. The savings in process design and efficiency for future plants could be tremendous. Much of this year has been spent in generating the samples on which detailed compositional and physical property analyses are to be performed. A Wilmington, CA, crude having an API gravity of 14 was distilled, and the heavy distillate was hydrotreated at a number of conditions. Preliminary analyses have been completed on the resulting upgraded samples. In addition, facilities for supercritical extraction and hydrotreatment of residues have been modified for automated operation to aid in data retrieval. A storage stability test that is applicable to small samples has been completed and is in the process of being modified for use with heavy fractions.

29773 **(STEV-BF—83-14) Building and running of a pilot catalytic cracker.** Matsson, M.; Roej, A. (Statens Energiverk, Stockholm (Sweden)). Jun 1983. 67p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750843.

A pilot catalytic cracker for heavy oils has been built at Chalmer Univ. of Technology, on a licence from Atlantic Richfield, USA. The cracker is equipped with two gaschromatographs, one for refinary gas analysis, and one for simulated distillation. A reactor for microactivity tests has been built, to be used for fast characterization of catalysts and oils. Total investment cost is 2 MSEK. A procedure for the pilot cracker runs, including analyses and material balance calculations has been designed. The results show good reproducability and give high and stable material balances.

0205 Products And By-products

29774 **(AD-A—152087/3/XAB) Absorbance changes as a measure of fuel degradation. Technical note.** Coleman, J.R.; Gallop, L.D. (Defence Research Establishment, Ottawa, Ontario (Canada)). Dec 1983. 42p. (In French). (DREO-TN—83-33). NTIS, PC A03/MF A01.

The purpose of this work is to examine absorbance (optical density) changes as a method of following the degradation of aviation turbine fuels when subjected to thermal stress. Thermal degradation differs in some ways from degradation on storage, a problem arising from slow reactions between unstable fuel components with air, water, and container linings, as affected by diurnal or seasonal climatic changes. In commercial fuels a variety of additives - antioxidants, metal deactivators and corrosion inhibitors are introduced, primarily to reduce the effects of these long term processes. The concern here is with thermal stability - the resistance of the fuel to relatively brief periods of elevated temperature in the presence of air and of heated metal surfaces. A method for following the course of thermal degradation of aviation turbine fuels was examined, based on the Phillips 5-ml bomb test, and measuring absorbance changes in the thermally stressed fuel at 340 millimicrons. Comparisons were made with a method based on direct measurement of weights of solid deposited from the fuel.

29775 **(PB—85-183705/XAB) Thermodynamic characterization of conversion-process oils as materials of continuous distribution. Annual report, January-December 1984.** Weil, S.A.; Abbasian-Amin, M.J.; Landahl, C.D. (Institute of Gas Technology, Chicago, IL (USA)). Mar 1985. 82p. NTIS, PC A05/MF A01.

See also PB84-189091.

The proposed description of a continuous oil considers it as made up of a set of fractional continuous oils. The distribution functions of these fractional oils is appropriately based on the vapor pressure-boiling point-temperature dependence so that the form of the functions are maintained in equilibrium vapor-liquid transformations with explicit transformation rules for the parameters. An application of these concepts to sequential operations has shown that accuracy is maintained very well. From measurements of the equilibrium ratios of a shale oil in a low-pressure batch distillation system, a readily definable function of the boiling point proved to be a suitable characteristic variable for the proposed description. Also the apparent ideality of the system, with respect to liquid phase composition, is appropriate to the proposed description. A possible procedure for handling non-ideal liquid phase characteristics is being developed. A high-pressure batch distillation system was designed and is being constructed to extend the data base.

0206 Health And Safety

29776 **(NUREG/CR—4190) California offshore survey of licensees using radioactive material.** Wong, K.S.; Brown, J. (California Dept. of Industrial Relations, Sacramento (USA). Div. of Occupational Safety and Health; California Dept. of Health Services, Sacramento (USA)). May 1985. 19p. NTIS, PC A02/MF A01 - GPO. File Number TI85901487.

This report is an account of offshore radioactive material activities and was prepared to provide information about their safe use in the marine environments beyond California's jurisdiction. The report supplies the essential information called for and (a) identifies licensees with radioactive nuclide utilization programs, (b) describes the licensees' work stations, (c) identifies and/or describes radionuclide, quantities and their applications, and (d) describes the radiation safety concerns and existing methods for their resolution. Finally, three offshore sites were inspected in a typical compliance manner and the findings reported. Enclosed photographs of the work stations, during source and equipment use, illustrate conditions and the licensees' operations. It is concluded from observations during onsite visits to these unusual work environments, that periodic onsite compliance inspections are necessary to assure radiation protection for all concerned.

29777 (DOE/EIA—0109(85/03)) **Petroleum Supply Monthly, March 1985.** (USDOE Energy Information Administration, Washington, DC). May 1985. 105p. NTIS, PC A06/MF A01; 1 - GPO; GPO Dep. File Number DE85012414.

This report contains detailed statistics on the supply and disposition of petroleum and petroleum products for March 1985. Information on crude oil, finished motor gasoline, distillate fuel oil, residual fuel oil, liquefied petroleum gases are included. Detailed statistics show production for the current month as well as the year-to-date. Data are also tabulated for the US Petroleum Administration for Defense (PAD) Districts which include field production, refinery production, imports, stock withdrawal or addition, unaccounted for crude, net receipts, crude losses, refinery inputs, exports, products supplied, and ending stocks. 13 figs., 33 tabs.

29778 **(DOE/EIA—0340(84)1) Petroleum Supply Annual, 1984. Volume 1.** (USDOE Energy Information Administration, Washington, DC). Jun 1985. 135p. NTIS, PC A07/MF A01; 1 - GPO; GPO Dep. File Number DE85013235.

Information on US supply, disposition and stocks of crude oil and petroleum products is provided for each month of 1984 in this first of 2 volumes. This volume contains two sections, petroleum supply summary and refinery capacity each with final and annual data. The summary includes a description of the major events in the petroleum industry during 1984 including trends in supply, consumption, and production. Graphs and tables are provided which show 12 years of data depicting the balance between supply, disposition and ending stocks for various commodities including crude oil, motor gasoline, distillate fuel oil, residual fuel oil and liquefied petroleum gases. Tables also provide 1984 detailed statistics on supply and disposition, refinery operations, imports and exports, stocks, and transportation of crude oil and petroleum products. The section on refinery capacity describes major activities within the refinery industry in 1984. Of particular note are listings of facilities and associated capacities in each State. In addition, summaries of corporate refinery capacities, refinery storage facilities in selected States, refinery shutdowns during 1984, refinery sales and mergers since 1981, and projected changes in input and production during 1985 and 1986 are provided. 12 figs., 44 tabs. (DMC)

29779 . (DOE/EIA—0340(84)/2) **Petroleum Supply Annual, 1984. Volume 2.** (USDOE Energy Information Administration, Washington, DC). 19 Jun 1985. 431p. NTIS, PC A19/MF A01; 1 - GPO; GPO Dep. File Number DE85013652.

Information on US supply, disposition, and stocks of crude oil and petroleum products is provided for each month of 1984 in this second of two volumes. This volume contains: national statistics; supply and disposition by Petroleum Administration for Defense (PAD) District; production of crude oil and lease condensate by State and PAD District; natural gas plant processing by PAD District; refinery operations by PAD District; imports and exports; stocks by PAD District; transportation; and heavy fuel oils by sulfur content. Explanatory notes describe the data collection forms and methodology. A glossary is provided. 29 tabs.

29780 (DOE/EIA—0380(85/03)) **Petroleum Marketing Monthly, March 1985.** (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). May 1985. 156p. NTIS, PC A08/MF A01 - GPO; GPO Dep. File Number DE85012994.

This report presents monthly summaries of petroleum product marketing statistics for the US, Petroleum Administration for Defense (PAD) Districts, and individual states. Four types of petroleum product statistics are included: sale prices, sale volumes, percentages of product sales, and first sales of products for consumption. Salient statistics are highlighted in a summary section, and each of the four subjects are treated in detail in other sections. The first tables in each of the first three sections provide national-level statistics on sales of the various products to end-users and for resale. The following tables provide finer geographic and type of seller detail and are grouped by product, beginning with motor gasoline and ending with either residual fuel, oil or propane. The majority of the tables show data for the report month and previous month for the current year. Data on motor gasoline, aviation fuel, jet engine fuel, kerosene, distillate fuel oils, residual fuel oils, and propane are included. A glossary is included. 17 figs., 75 tabs.

29781 (DOE/EIA—0469) **Energy Facts, 1984.** Daniels, J.E. (USDOE Energy Information Administration, Washington, DC). May 1985. 54p. NTIS, PC A04/MF A01 - GPO; GPO Dep. File Number DE85011950.

This booklet provides a quick reference to a broad range of domestic and international energy data for the general public, as well as for the technical community. It is especially designed for students and business people who need a quick reference to major facts about energy. The time period covered is 1973 to 1984, except for world energy data, which covers 1973 to 1983. Graphics are used to portray trends, shares, and locations of various energy sources and uses.

0208 Waste Management

REFER ALSO TO CITATION(S) 31254, 31673

29782 (NMERDI—2-73-4622) **Gas and oil production wastewater disposal alternatives for the San Juan Basin. Final report.** Zygmunt, S.J.; Andrews, T.L.; Siegel, J.H. (Delta H Engineering Ltd., Santa Fe, NM (USA)). Jun 1985. 110p. NTIS, PC A06/MF A01 - NMERDI-Univ. of New Mexico, 457 Washington SE, Albuquerque, NM 87108 . File Number DE85901566.

Oil and gas production in the San Juan Basin of New Mexico yields small quantities of water contaminated with salts, metals and hydrocarbons. The study compared alternative costs for lined pond evaporation, double walled tank evaporation, gas fired evaporation, deep well injection and various treatment methods. A hand held calculator program was written to predict evaporation from lined ponds. Data for pond design for the San Juan Basin was prepared.

29783 (PB—85-180297/XAB) **Composition and management of used oil generated in the United States.** Bider, W.L. (Franklin Associates, Prarie Village, KS (USA)). Nov 1985. 172p. NTIS, PC A08/MF A01.

The report summarizes information acquired by the EPA over the period of 1981-1984. Analytical results from over 1000 samples of various types of used oils are presented, and grouped by where the samples came from as well as the recycling method employed. Estimates are also presented concerning the number of facilities generating and processing used oil, as well as the amounts of used oil generated and managed in various ways.

0209 Environmental Aspects

29784 (NIPER—20, pp 343-352) **Diesel exhaust characterization.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Particulate studies have involved processing extracted particulate samples from five light-duty diesel vehicles through a chromatographic scheme to separate the extracts into 10 fractions which were biologically tested. The biological data of the different fractions were evaluated to determine if the biological activity of the extract could be predicted using some measured variables in the particulate analysis. The results of these studies showed that the mutagenic activity was primarily concentrated in a fraction containing nitro-PAH compounds and the mutagenic activity for that fraction ranged from 42 to 90% of the total sample activity, yet the weight-percent of this fraction ranged from 6 to 23% of the total extract mass. The remaining mutagenic activity was found in other fractions containing polar compounds. The mutagenic activity of the particulate extracts from a vehicle fueled with the alternate fuel blends was 30 to 50% higher than particulate extracts using the reference fuel. An engine operating on jet fuel yielded particulate with significantly lower mutagenic activity. The emission particulate extractables were higher from the direct-injection engine. Evaluation of the results did not indicate any interaction of fuel, engine, or modal effect on emission level or biological activity of the extractable material.

29785 (NIPER—20, pp 77-85) **EOR environmental compatibility.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

A program was started to investigate and determine the environmental hazards associated with enhanced oil recovery (EOR). During the first year, process performance and potential environmental hazards of microbial EOR (MEOR) were investigated. The results of the first year's effort were a publication on the state of the art of MEOR, assembly of a microbial laboratory capable of performing MEOR coreflood experiments, a report on designing MEOR reservoir data bases, 35 microbial isolates for use in environmental studies, and a report on environmental hazards of MEOR. An opportunity to chair an international symposium on groundwater contamination and edit the papers for a prestigious standards publication was accepted.

29786 **(NMERDI—2-72-4628) Water use, conservation and wastewater treatment alternatives for oil refineries in New Mexico.** Timm, C.M. (Jacobs Engineering Group, Inc., Albuquerque, NM (USA)). May 1985. 199p. NMERDI, Suite M., 457 Washington SE, Albuquerque, NM 87108. File Number DE85901468.

This study analyzed the present operations, water use and wastewater treatment and disposal of the operating refineries in New Mexico. Alternatives for water conservation and wastewater reduction/treatment were evaluated for applicability and cost effectiveness. New Mexico refineries presently use from 10.6 to 39.1 gallons of water per barrel of crude oil and generate 6.5 to 25.4 gallons of wastewater per barrel of crude. All New Mexico refineries use either API or tilted plate separators for oil recovery followed by evaporation/percolation ponds. In comparison to national averages, New Mexico refineries have excessively high boiler and cooling tower blowdown rates. Better operational controls could reduce water use significantly. Also, the oil and grease concentration in the effluents are higher than the national average, indicating that better operational control is needed in this area as well. Several water savings alternatives including recycling water to the desalter, adding vacuum pumps to the vacuum unit and adding air coolers to the crude unit were recommended which would reduce water use by sixteen percent (16%). Due to the stringent discharge standards and pending hazardous waste regulations, it was found to be more cost effective to construct new, lined ponds than to add BAT. The cost to clean up existing ponds which were assumed to be hazardous waste TSDFs was also evaluated. Costs for removal and proper disposal of the refinery sludges could be as high as $600,000/acre of pond. Regardless of the water conservation treatment measures adopted, the existing ponds will still require cleanup which could result in the closure of the remaining refineries in New Mexico. 32 refs., 21 figs., 31 tabs.

29787 **(OCS/EIS/MMS—85-0032) Final environmental impact statement: proposed 1985 Outer Continental Shelf oil and gas Lease Sale No. 111, offshore the Mid-Atlantic states.** (Minerals Management Service, Vienna, VA (USA). Atlantic OCS Region). 1985. 824p. Minerals Management Service, Vienna, VA 22180. File Number TI85901498.

The proposed action is the offering of 3561 blocks (20 million acres) located from 50 statute miles (25 statute miles off North Carolina) to 140 statute miles offshore Rhode Island, New York, New Jersey, Delaware, Maryland, and Virginia for leasing in accordance with the Outer Continental Shelf Lands Act, as amended. The average water depths of these blocks range from 40 to 3200 meters. Sale No. 111 is tentatively scheduled for October 1985. Alternatives considered include a delay of the sale, canceling the sale (no action), and three deferral alternatives. The deferral alternatives include one concerning blocks in the surface-free zone for the NASA Wallops Island Flight Facility, one to protect the biota of submarine canyon areas, and one to protect the biota on blocks shoreward of the Gulf Stream below 36°N. Oil and gas activities on all blocks studied in this Final Environmental Impact Statement (FEIS) pose some risk to the environment. Mitigating measures which may reduce the risk have been identified. Areas of potential impact onshore are Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, and North Carolina, and their coastal waters. Six maps of the Mid-Atlantic Outer Continental Shelf are included. These show the following: (1) lease status, coastal recreation and open space resources, potential hazards; (2) average surface circulation; (3) endangered species, major environmental geologic features and surficial bottom deposits; (4 & 5) selected domestic fish resources spring and summer distribution, and fall and winter distribution; and (6) petroleum related facilities and military operating areas. 473 refs., 32 figs., 56 tabs.

29788 **(GAO/RCED—85-88) Issues surrounding continuation of the noncompetitive oil and gas lottery system.** (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 4 Apr 1985. 56p. US General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20877. File Number TI85901570.

Report to the Chairman, Committee on Interior and Insular Affairs, House of Representatives.

The Bureau of Land Management is responsible for the leasing of oil and gas mineral rights on over 300 million acres of public lands. Under the Mineral Leasing Act of 1920, lands with known oil and gas deposits are leased competitively. However, much more federal land is leased through a noncompetitive lottery system, which generates substantial receipts for the federal Treasury - about $250 million in filing fees for the 5-year period 1980-1984. The lottery system has been criticized since its 1959 inception for encouraging fraud, misleading the public, and generating insufficient revenues. On October 12, 1983, the program was suspended for 10 months because of recognized weaknesses in the system. This report highlights major issues surrounding the lottery program.

29789 **Department of Energy's participation in the International Energy Agency's recent worldwide oil-sharing test (allocation systems test - AST-4). Hearing before a Subcommittee of the Committee on Government Operations, House of Representatives, Ninety-Eighth Congress, First Session, September 22, 1983.** Washington, DC; Government Printing Office (1984). 507p.

Eight witnesses from state, federal, and international energy offices and organizations reviewed DOE's performance during a test of the International Energy Agency's (IEA's) oil-sharing program, which simulated a supply disruption and the effectiveness of international cooperation in sharing available supplies. Only the Reagan administration found the free market approach to the test a success, while IEA, the oil companies, the State Department, and parts of DOE questioned whether market forces could handle all the problems in a real situation, particularly whether national security might be in jeopardy. Witnesses debated both the performance of a free market and the structure of the simulation test itself. Additional letters, statements, and other material submitted for the record and six appendices follow the testimony.

29790 (DOE/PC/60807—7) **Supercritical fluid chromatography/supersonic jet spectroscopy. Progress report, February 1, 1985-April 30, 1985.** Lee, M.L.; Goates, S.R. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemistry). 1985. Contract FG22-83PC60807. 13p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012539.

Supercritical fluid (SF) fractionations of a petroleum crude oil and a solvent refined coal heavy distillate (HD) were conducted. The flame ion detector (FID) uv chromatograms of the petroleum crude oil and SRC II HD on NH_2-modified silica with CO_2 at 40°C are shown in Figures 3 and 5, respectively. The gas chromatograms of the fractions are shown in Figures 4 and 6. Because this crude oil contained compounds with such a wide range of molecular weights, a chemical class separation was not possible on this column. However, for the fractionation of SRC II HD, the aliphatics and neutral aromatics eluted in the first fraction and the nitrogen compounds and high molecular weight neutral aromatics eluted in the second fraction. It was concluded that the FID system performed satisfactorily on the whole. Progress on supersonic jet spectroscopy has been inhibited this quarter by the need to temporarily vacate the spectroscopy lab for physical plant modifications. The investigators used this time to evaluate the experiment and their approach. Their initial spectroscopic results with naphthalene have demonstrated considerable improvement in spectral resolution by supersonic jet/supercritical fluid technique, but sensitivity has been lacking, and they have not yet achieved the same degree of jet cooling that has been demonstrated with conventional carrier gases. These problems are under investigation.

29791 (NIPER—20, pp 241-250) **Thermophysical and thermochemical properties of organic compounds derived from fossil substances.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Thermodynamic studies are described on the thermophysical and thermochemical properties of organic oxygen compounds and on related hydrogen bonding fluids. Combustion calorimetric studies were completed on chroman, isochroman, and 4,5-dihydro-2,3-benzofuran. Condensed-phase heat-capacity and enthalpy measurements were completed on 2,3-benzofuran and isochroman, and vapor pressure studies were completed on 2,3-benzofuran. The results were used to test group-contribution thermodynamic-prediction methods and showed that the data base previously used for the development of the predictions is inadequate. As a concurrent part of the foregoing studies, equipment developments were made for all of the property measurements. A new platinum calorimeter was constructed, and progress was made on the construction of two new cryostats for condensed-phase heat-capacity measurements of reactive substances at temperatures from 4 to 523 K. New designs were developed for a combustion calorimetric system which will require one-tenth of the sample presently required but still provide the precision, 0.002%, and accuracy presently attained. New designs were also developed for a torsion-effusion vapor-pressure apparatus for the measurements on high molecular weight substances which cannot be studied with methods suitable for substances with high pressures. In the study of hydrogen-bonded fluids, a flow calorimetric system for direct measurement of enthalpies of vaporization and vapor-heat capacities was extensively modernized and automated, and calorimetric measurements were made on 3-methylpyrrolidine and 2-methylpiperidine with only partial success. For pressure-volume-temperature (PVT) studies, a suitable confinement system was designed and constructed to obtain measurements on methanol without decomposition, and final calibration of the system is well underway.

29792 (NIPER—20, pp 299-308) **Chemical characterization of heavy ends of light petroleum, of heavy petroleum, and of liquids derived from other fossil sources.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Field ionization mass spectral sensitivities were determined for components in eight mixtures of aromatic hydrocarbons which included several compounds not previously studied. The results were inconclusive in that several sensitivity values were in close agreement with previous determinations and several values did not agree well. Aromatic fractions separated according to aromatic ring number from distillates of heavy petroleum are being characterized and evaluated for their suitability in determination of ultraviolet, gas chromatography/flame ionization detection, and mass spectral average response factors. Synchronous scanning fluorimetry and gas chromatography/mass spectral results were generally consistent with the ring number assignment for the monoaromatic, diaromatic, and three- and four-ring aromatic fractions examined to date. Methodology is being developed for fractionating acidic components of fuels according to compound class and analyzing the resulting fractions. Results so far indicate: (1) subfractionation of samples containing only distillable acids resulted in subfractions containing compound classes consistent with those predicted from preliminary work with model systems, (2) unsatisfactory results were obtained on acid concentrates from residue fractions using the ether-based solvent system which prompted the development of a chloroform-based solvent system for separations of residue acid concentrates, and (3) the major weakness of the overall method is the aqueous extraction of tetramethylammonium hydroxide from the resulting fractions because it is time-consuming and sometimes contributes to incomplete recovery of acids.

29793 (NIPER—20, pp 319-330) **Chemistry of contaminated petroleum fuels.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

As the proportion of lower quality petroleum crudes used for fuel generation increases, the level of nonhydrocarbons present also increases. One way of studying the effect of these components is to investigate current fuels that have become contaminated. This project involves contaminated distillate fuel of known initial quality and is partially sponsored by the US Navy. The research is planned to lead ultimately to a practical technique for the conversion of reclaimed product (RP) into naval distillate fuel (F-76). The first phase of the project, which is now completed, focused on the review of the literature and the available information on waste fuel processing. This information has been carefully reviewed, and the specific information required for the upgrading of RP to F-76 has been prioritized and presented in a report. Based upon these results, Phase II of the project has been initiated. In this phase experiments are being performed to determine the most practical upgrading process(es). This report summarizes the major accomplishments for both Phase I and II for FY1984 and presents preliminary results and conclusions. These include the compilation of an extensive bibliography of literature on waste hydrocarbon recycling, a ranking of possible reclamation technologies and the preliminary evaluation of a number of the technologies proposed in Phase I.

29794 (NIPER—20, pp 275-286) **Chemical characterization of heavy ends of light petroleum, of heavy petroleum, and of liquids derived from other fossil sources.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Several fractions from the Venezuelan heavy petroleum, Cerro Negro, have been analyzed by high-resolution mass spectrometry. These include acid and base fractions from the 200°-425°C distillate, and base and aromatic neutral fractions from the 425°-550°C distillate. Using low-voltage, electron-impact spectra recorded earlier, elemental compositions were assigned to the ions in the spectra based on precise mass measurement. Carbon-number distributions and elemental analyses were calculated from the data, and the latter results were compared with those obtained from a conventional analysis. The acid fraction from the 200°-425°C distillate was found to consist predominantly of compounds in the following homologous Z series: C/sub n/H/sub 2n+z/N, C/sub n/H/sub 2n+z/O_3, C/sub n/H/sub 2n+z/O, and C/sub n/H/sub

2n+z/SO_2 in order of decreasing abundance. In the base fraction from the same distillate the predominant compounds were found in the series: C/sub n/H/sub 2n+z/N and C/sub n/H/sub 2n+z/NS. The data for the base fraction from the 425°-550°C distillate showed that this fraction consists primarily of compounds of the type C/sub n/H/sub 2n+z/N, C/sub n/H/sub 2n+z/NS, and C/sub n/H/sub 2n+z/NS_2. In the aromatic neutral fraction from the same distillate, compounds of the type C/sub n/H/sub 2n+z/S and C/sub n/H/sub 2n+z/, i.e. hydrocarbons, were found as the principal components.

29795 (NIPER—20, pp 309-318) **Fuel trends and analyses.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Five major fuel survey reports have been published and distributed during the past year. These surveys define the quality of fuels available in the current market place. Abstracts of each of the surveys are presented with tables of summary information. The five reports are for diesel fuels, motor gasolines (winter and summer), aviation fuels and heating oils. A report on long-term trends in fuel properties was prepared.

29796 (NIPER—20, pp 331-336) **Diesel fuel quality criteria.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

This program is concerned with examining influences on engine performance of diesel fuel parameters that are affected by increased utilization of alternative feedstocks. Tests were conducted on two Caterpillar heavy-duty engines. Ranges in fuel properties--distillation characteristics and aromaticity--were selected as parameters for a fuel matrix. Particulate samples were collected in large 20- by 20-inch and 40- by 40-inch filters. In the first of the projected runs, two fuels were utilized: the No. 2-D diesel reference fuel and a high-aromatic blend containing light-cycle oil. Results from both engines show increased hydrocarbon and particulate mass emissions with use of the highly aromatic light-cycle oil blend.

29797 (NIPER—20, pp 337-342) **Direct utilization of aromatic feedstocks.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Increased use of heavy crudes in the refining industry has produced increased amounts of aromatic components in the distillate fuels resulting in poor diesel fuel quality. A research program was initiated to evaluate the potential of using in gasolines a portion of the heavy aromatics (up to 500°F cut) from coal-derived and heavy-petroleum crudes due to the expected high-octane quality of this fraction. Data were generated on exhaust emissions, vehicle driveability, and fuel octane quality using 10 and 25% of the material blended with gasoline. Engine durability was examined using a 10% blend of the heavy aromatic material with gasoline. Test results suggest a significant adverse effect on exhaust emissions and driveability using 25% concentrations of the material in gasoline but only minor effects using 10% concentrations. Octane quality of the materials was determined to be essentially equivalent to the base gasoline. Engine durability testing suggested significantly adverse engine-deposits formation in a 2,000-mile urban duty accumulation test.

0240 Storage

29798 (DOE/FE—0048) **Overview on assessment of crude oil and refined product quality during long-term storage.** Giles, H.N.; Bowden, J.N.; Stavinoha, L.L. (USDOE Assistant Secretary for Fossil Energy, Washington, DC. Strategic Petroleum Reserve; Southwest Research Inst., San Antonio, TX (USA). Army Fuels and Lubricants Research Lab.). Jun 1985. 43p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012754.

This report presents the findings of a number of studies on the qualitative effects on petroleum resulting from prolonged storage primarily in deep underground caverns, but also in aboveground tanks. These studies comprised a literature survey, discussions with scientific and technical personnel in various petroleum companies, and a comprehensive laboratory investigation of samples from several strategic reserve sites in West Germany. It is demonstrated conclusively that both crude oil and refined products can be stored for prolonged periods without undergoing deleterious changes in quality. The most practical and economic mode of storage is in caverns in salt deposits. Moisture is likely the single most significant contributor to petroleum degradation because it will harbor microorganisms and fungi which metabolize hydrocarbons. Long-term storage stability can be enhanced by selecting products which are inherently stable and are additive treated. The storage stability of the product should be thoroughly evaluated, and a monitoring program instituted to periodically assess the quality of the petroleum in storage. 40 refs., 13 figs., 8 tabs.

29799 (DOE/OR/21403—T1) **Design review for Strategic Petroleum Reserve Office: Big Hill, Texas; New Orleans, Louisiana. Appendix.** (Bechtel Petroleum, Inc., Houston, TX (USA)). Feb 1984. Contract AC05-84OR21403. 315p. NTIS, PC A14/MF A01. File Number DE85012881.

The Appendix consists of conference notes, letters, and logs of the various documents received by Bechtel to conduct the Design Review. The drawing logs are segregated by Contract Package. The logs for specifications, calculations, pre-design documents, and deviation requests apply to all packages.

29800 (DOE/OR/21403—T2) **Design review for Strategic Petroleum Reserve office, Big Hill, Texas, New Orleans, Louisiana.** (Bechtel Petroleum, Inc., Houston, TX (USA)). Feb 1984. Contract AC05-84OR21403. 419p. NTIS, PC A18/MF A01; 1; GPO Dep. File Number DE85012545.

The Big Hill Strategic Petroleum Reserve storage site is designed to store 140 million barrels of oil in underground storage caverns. The major facilities of the Big Hill Strategic Petroleum Reserve storage site are: the main operations area; the storage cavern area; the Raw Water Intake Structure at the Intracoastal Waterway; the raw water pipeline between the Big Hill operations area and Raw Water Intake Structure; the brine disposal pipeline from the Big Hill complex to 3-1/2 miles into the Gulf of Mexico; and, the crude oil pipeline between the Sunoco Terminals in Nederland and Big Hill Complex. These facilities are designed to solution mine the storage caverns from naturally occurring salt domes below the Big Hill complex site, as well as, to transport the crude oil in and out of the caverns to/from the Sunoco Terminals. Bechtel Petroleum, Inc. through Bechtel Advanced Technologies has been engaged to conduct a review of the design of the Big Hill facilities. The purpose of this design review is to audit design and construction documents to: ensure that the design complies with established design criteria; ensure the constructability of the design; and ensure that the interfaces between the construction packages are adequate. To this end, Bechtel was provided with construction contract packages, most design calculations and various pre-design documents. A summary of the scope of each contract package can be found on Table I.

29801 (GAO/RCED—85-111) **Status of Strategic Petroleum Reserve activities as of March 31, 1985.** (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 15 Apr 1985. 36p. US General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20877. File Number TI85901572.

The Department of Energy reported that the Strategic Petroleum Reserve contained 461.6 million barrels of oil on March 31, 1985. During the second quarter of fiscal year 1985, about 11.1 million barrels of oil were added for a fill rate of 123,000 barrels per day. This report discusses the progress being made in filling, developing, and operating the Reserve. It also discusses other events and activities affecting the Reserve that occurred during the second quarter of fiscal year 1985. 11 tabs.

29802 (SAND—84-1957) **Preliminary SPR thermal model description and results for WH-11 and BM-4.** Tomasko, D. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 41p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85013171.

Fluid temperatures within the Strategic Petroleum Reserve caverns are calculated using a modified one-dimensional, time-dependent Rahm-Walin equation coupled to a two-dimensional, time-dependent heat conduction equation in the salt massif. Comparisons of model results with experimental data from West Hackberry Cavern 11 and Bryan Mound Cavern 4 are very good for up to eight years of cavern life. 13 refs., 19 figs., 7 tabs.

29803 **(SAND—85-0045) Analysis of drag reducing agents for use at the Strategic Petroleum Reserve site at West Hackberry, Louisiana.** Hinkebein, T.E. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 50p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013170.

An analysis method for evaluating the use of polymeric drag reducing agents (DRA) within the Strategic Petroleum Reserve brine disposal pipelines has been formulated. This method is based upon a detailed flow model describing the flow of solutions with DRA through the brine pipeline at West Hackberry, Louisiana. The verification of this model is confirmed by the Southwest Research Laboratory data. This model indicates that the drag reduction effect is dependent on polymer solution type and concentration as well as the fluid wall shear stress and the pipe roughness. For the West Hackberry pipeline, it is projected that a 20% flow increase is attainable with the best polymers. Further drag reducing agent tests are proposed to allow a more accurate prediction of flow improvement. 12 refs., 21 figs., 3 tabs.

29804 **(LA-UR—85-1728) KIVA computer program for multidimensional chemically reactive fluid flows with fuel sprays.** O'Rourke, P.J. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 17p. (CONF-8505150—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012730.

From Symposium on numerical simulation of combustion phenomena; Sophia-Antipolis, France (21 May 1985).

This paper is a presentation of the capabilities of the KIVA computer program, which was written to calculate both two- and three-dimensional chemically reactive fluid flows. KIVA solves by finite-difference techniques the unsteady equations for a multi-component, chemically reactive mixture of ideal gases, together with those for an evaporating liquid spray. Although it was written with applications to internal combustion engine research in mind, with modification KIVA can be applied to a variety of other combustion and two-phase flow problems. This paper emphasizes the differences between KIVA and the well-known CONCHAS-SPRAY computer program and gives some advantages and disadvantages of the numerical methodology in KIVA. We illustrate the capabilities of the program by describing the results of numerical test problems.

29805 **(DOE/MC/20342—1838) Effects of water and stress upon permeability to gas of paludal and coastal sands: USDOE multiwell experiment.** Randolph, P.; Soeder, D.J.; Chowdiah, P. (Institute of Gas Technology, Chicago, IL (USA)). Feb 1985. Contract AC21-83MC20342. 211p. NTIS, PC A10/MF A01; 1; GPO Dep. File Number DE85008607.

Detailed parametric analyses of the effects of (1) net stress on the rock matrix and (2) fractional water saturation of pore volume upon permeability to gas were performed for four samples from each of two Mesa Verde depositional environments (paludal and coastal). This included measurement of the Klinkenberg parameters for the two net stresses for each sample and calculation of flow path characteristics (width and upper limit of tortuosity). The work simultaneously involved three categories of activity: (1) measuring matrix parameter values for computer simulation of production from DOE's MWX experiment; (2) improving understanding of tight sandstone pore morphology and the physical principles that control gas content and gas transport in the in-situ reservoir; and (3) advancing laboratory core analysis technology such that results are more likely to provide a valid description of the undisturbed in-situ reservoir from which the samples were obtained. Conclusions, implications of results obtained, and recommendations for future action on each of these topics are presented under the following subheadings: matrix parameters for computer simulation of production; pore morphology and the physics of fluid transport; and advances in core analysis technology. 9 refs., 38 figs., 10 tabs.

29806 **(PB—85-183697/XAB) Heat-of-mixing experiments for liquefied gases. Annual report, November 1983-October 1984.** Zollweg, J.A.; Streett, W.B. (Cornell Univ., Ithaca, NY (USA). School of Chemical Engineering). Dec 1984. 17p. NTIS, PC A02/MF A01.

See also PB84-215094.

Calorimetric measurements of the excess enthalpy in the systems nitrogen/carbon monoxide at 83.82 K and carbon monoxide/methane at 91.3 K were performed in a batch-mixing calorimeter. The observed equimolar excess enthalpy for N_2/CO (41.2 + or - 1.2 J/mol) is consistent with the temperature variation of G(sup E) deduced from vapor-liquid equilibrium measurements. It is much larger, though, than one would predict from conformal solution theories with Lorentz-Berthelot mixing rules. Thus it appears that the excess entropy is positive in methane-rich mixtures.

29807 **(PB—85-184083/XAB) Flame-acceleration mechanisms under conditions of partial confinement. Final report, February 1983-August 1984.** Strehlow, R.A.; Ormsbee, A.I.; Yip, T.W.G.; Reichenbach, S.H. (Illinois Univ., Urbana (USA). Dept. of Aeronautical and Astronautical Engineering). Sep 1984. 132p. NTIS, PC A07/MF A01.

See also PB83-244012.

A technique has been developed to quantify the violence of the interaction of a flame with a vortex in the flow. The vortex was generated in the wake of a corner or at the trailing edge of a plate by causing a premixed flame to act as a piston in a channel. When the flame exited the channel it immediately interacted with the vortex. The apparatus has cylindrical symmetry and the output of sensitive pressure transducers was used with acoustic monopole theory to determine the violence of the flame-vortex interaction process as a function of channel dimensions and normal burning velocity of the combustible mixtures. This flow was modeled by Dr. Pam Barr of the Sandia Livermore National Laboratories and the violence of the interaction was analyzed in terms of the calculated vorticity Reynolds number of the vortex. A shock tube was used to generate vortices and observe the breakdown process, to determine how a maturing vortex breaks down to become turbulent. The results of this study are also presented.

29808 Changes in policies affecting US natural gas trade. Levine, L.B. (Dept. of Energy's Economic Regulatory Administration (ERA), Washington, DC). *Journal of Energy and Development;* 10: No. 1, 117-120(Aut 1984).

Encouraging signs can be found in the beginnings of competition among suppliers of Canadian gas for US markets. Several new exporters have appeared, firms which have not been involved in exporting directly before; more appear to be on the horizon. As additional competition surfaces in areas not seen before, this trend will be observed with interest. In addition, in the area of short-term or spot sales, we see new competitive pressures asserting themselves as new exporters in Canada and importers in the US participate in the gas trade. Industrial users and US distribution companies are taking advantage of market opportunities to obtain more competitive gas supplies. The new regulatory procedures at ERA should be able to give the freedom to continue deriving benefits from this opportunity in a timely manner.

29809 (N—85-15926) Risks in the transport and storage of liquefied natural gas. Sub-project 5-2: investigation into building damage. Gouwens, C.; Dragosavic, M. (UKAEA Risley Nuclear Power Development Establishment). 1984. 32p. British Library Lending Div., Boston Spa, England.

The large reserves and increasing use of natural gas as a source of energy have resulted in its storage and transport becoming an urgent problem. Since a liquid of the same mass occupies only a fraction of the volume of a gas, it is economical to store natural gas as a liquid. Liquefied natural gas is stored in insulated tanks and also carried by ship at a temperature of -160 C to 170 C. If a serious accident allows the LNG to escape, a gas cloud forms. The results of a possible explosion from such a gas cloud are studied. The development of a leak, escape and evaporation, size and propagation of the gas cloud, the explosive pressures to be expected and the results on the environment are investigated. Damage to buildings is examined making use of the preliminary conclusions of the other sub-projects and especially the explosive pressures.

29810 (RISO-M—2416) Simulation of enhanced oil recovery methods in Danish oil and gas reservoirs. A preproject. Bech, N. (Risoe National Lab., Roskilde (Denmark)). Sep 1984. 210p. NTIS (US Sales Only), PC A10/MF A01. File Number DE85750795.

A literature study has been performed in order to provide the basic information required to design a reservoir simulation model, specifically suited for studies concerning the application of enhanced oil recovery in Danish oil and gas reservoirs. The report contains a brief introduction to the concept of reservoir simulation, a classification of existing reservoir simulators with respect to area of application, mathematical and numerical models, and miscellaneous features, a characterization of Danish oil and gas reservoirs from the simulation point of view, a listing of enhanced oil recovery methods that are considered potential candidates for use in Danish reservoirs, and a discussion of simulator requirements and recommendations regarding computer code development. The proposal involves a fully compositional, isotherm, finite difference simulator.

29811 (SAND—85-0990C) Comprehensive fracture diagnostics experiment. Part II. Comparison of seven fracture azimuth measurements. Smith. M.B.; Ren, N.K.; Sorrells, G.G.; Teufel, L.W. (CONF-8505115—5). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011707.

From SPE/DOE symposium on low permeability reservoirs; Denver, CO, USA (19 May 1985).

A great deal of effort has been devoted recently to find geophysical techniques for measuring the hydraulic fracture azimuth. This paper discusses a comparison of seven different measurements used to determine the azimuth in a sandstone formation at a depth of 1000 ft (320 m). The azimuth was determined as N95E, but significant differences existed between some of the results. This is of fundamental importance since in developing new measurements, the limits of these must be found and honored. Of particular interest are the results from microseismic monitoring. The lack of results suggests that remote (e.g., surface) monitoring for seismic events may be impractical for normal, sedimentary, hydrocarbon-bearing formations. 33 refs., 6 figs., 3 tabs.

29813 (DOE/ER/60036—T2-Vol.1) Studies of the Scottish oil shale industry. Volume 1. History of the industry, working conditions, and mineralogy of Scottish and Green River formation shales. Final report. Louw, S.J.; Addison, J. (Institute of Occupational Medicine, Edinburgh (UK)). Mar 1985. Contract AC02-82ER60036. 101p. (IOM-TM—85/2). NTIS, PC A06/MF A01; GPO Dep. File Number DE85013323.

This report (in 3 volumes) describes the now defunct Scottish oil shale industry and effects on the health of its workers. The first volume recounts in brief the technological history of the industry's mines and retorts. This is based on a survey of available documents which, together with first-hand accounts from interviews with surviving shale workers, have also been used to make an assessment of dust conditions and of safety precautions in the industry. It also includes a mineralogical characterization of Scottish shales compared with those from the Green River formation in the Colorado Rockies. This industry had a life span of some 112 years from its foundation in 1850, when James 'paraffin' Young constructed a facility to retort and refine cannel coal near Bathgate, West Lothian. At its peak, in 1913, the industry employed 10,000 people though economic factors forced its subsequent gradual decline and the final blow was struck when the differential excise duty was withdrawn in 1962. 40 refs., 16 figs., 10 tabs.

29814 (DOE/METC—85/13, pp 36-57) **Major tar sand and heavy oil deposits of the US.** Kuuskraa, V.A.; Hammershaimb, E.C.; Paque, M. (Lewin and Associates, Inc., Washington, DC). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

A current assessment of US tar sand resources is presented, based on an independent appraisal of all tar sand deposits with 100 million or more barrels in-place and a review of published data for minor tar deposits (having between 10 and 100 million barrels in-place). The US tar sand resource is estimated to be 54 billion barrels distributed in eleven states. Of this, 22 billion barrels are classified as a measured resource and the remainder, 32 billion barrels, are classified as speculative. This resource estimate is considerably larger than reported in previous studies which had estimates ranging from 5.5 to 36.4 billion barrels. The distribution of the US tar sand resource by state is shown. In addition, over 1100 heavy oil deposits, an important but only partly developed energy resource, are described.

29815 (DOE/METC—85/13, pp 90-137) **Geology and resources of the Tar Sand Triangle, southeastern Utah.** Dana, G.F.; Oliver, R.L.; Elliott, J.R. (Western Research Institute, Laramie, Wyoming). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

The Tar Sand Triangle is located in southeastern Utah between the Dirty Devil and Colorado Rivers and covers an area of about 200 square miles. The geology of the area consists of gently northwest dipping strata exposed in the box canyons and slopes of the canyonlands morphology. Strata in the area range in age from Jurassic to Permian. The majority of tar sand saturation is found in the Permian White Rim Sandstone Member of the Cutler Formation. The White Rim Sandstone Member consists of a clean, well-sorted sandstone which was deposited in a shallow marine environment. Resources were calculated from analytical data from the three coreholes drilled by the Laramie Energy Technology Center and other available data. The total in-place resources, determined from this study, are 6.3 billion barrels. Previous estimates ranged from 2.9 to 16 million barrels. More coring and analyses will be necessary before a more accurate determination of resources can be attempted.

29816 (DOE/METC—85/13, pp 138-140) **Results of the DOE-OGS tar sand coring program, south-central Oklahoma.** Harrison, W.E.; Burchfield, M.R. (Oklahoma Geological Survey, Norman). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

A coring program to evaluate the tar sand potential of specific deposits in Carter and Murray Counties, Oklahoma is discussed. This cooperative efforts resulted in resource evaluation of the Sulphur deposit in Murray County and the South Woodford and Overbrook deposits in Carter County. A fourth site, the Dougherty deposit in Murray County, was assessed on the basis of field relations and surface samples. The Sulphur and Dougherty tar sand deposits were actively mined until 1958 and 1960, respectively, and cumulative production, for both sites, is estimated at 2.5 million tons. The Sulphur deposit was evaluated by a total of 56 industry and DOE-OGS boreholes with the following results. The deepest occurrence of bitumen at Sulphur was an industry borehole which recovered bitumen-impregnated Oil Creek Sandstone cuttings from 2600-2700 feet. Bitumen determinations of industry cores ranged from 0.9 to 12.9% (wt.) while the recovered DOE-OGS cores varied from 0.8 to 4.9%. Specific gravity of the extracted bitumen was 1.043 g/cc. Permeabilities of selected core samples, after Dean-Stark Distillation, were between 1 and 7 darcies; porosity varied from 22.0 to 28.1%. The measured in-place bitumen, as defined by industry and DOE-OGS boreholes, was calculated to be 34 million barrels. An additional 12.5 million barrels is thought to be probable at the Sulphur site. The Dougherty deposit is estimated to contain 3.6 million barrels of probable bitumen.

29817 (DOE/METC—85/13, pp 141-148) **Downhole hydraulic mining system.** Wagner, C.G.; Hodges, E.L. (California Tar Sands Development Corp., Orange). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

The downhole hydraulic mining system is designed to exploit deposits of oil-bearing sands that are not economically producible using current oilfield or mining technology. In most cases, the hydrocarbon in the reservoir is too viscous to flow into the wellbore naturally and application of heat (steam combustion gases) are inefficient or not feasible. Thus no oil is produced from the deposits. Through a borehole drilled from the surface, the hydraulic mining system can extract sands occurring at depths from 100 to 600 feet. The hydraulic tool utilizes high pressure water jets to cut the subterranean formation and create a sand/water slurry that is pumped to the surface where the oil can be concentrated and separated from waste materials. After separation the waste rock is reinjected into the underground cavern from which it was mined and the water can be cleaned and recycled into the mining systems. The hydraulic mining system has several inherent advantages, i.e., minimal environment impact and land disfigurement, application to deposits too deep for strip mining yet too shallow for heat, high percentage of oil recovery from in-place reserves, and high mobility of system.

29818 (DOE/LC/10763—1706) **High temperature mineral alteration of oil shale from an in-situ retorting experiment. Final report, September 1, 1981-May 15, 1983.** Howatson, J. (Wyoming Univ., Laramie (USA). Dept. of Chemistry). Mar 1984. Contract AS20-81LC10763. 31p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85004982.

This project was undertaken to determine the effects of in-situ processing on oil shale minerals. The "burn" from which the samples were obtained was carried out by Geokinetics Inc. at a site 112 km south of Vernal, Utah. Selected samples of a core which was drilled near the center of the burn were examined by Fourier transform spectroscopy. A sample of the hottest section of the "burn" core was also examined by scanning electron microscopy. For comparison core samples from a control hole drilled about 30 m outside the retorted zone were used in a series of laboratory retorting experiments from 600 to 1000°C. The products from the latter were examined by X-ray powder diffraction, Fourier transform infrared spectroscopy and scanning electron microsopy. Data from the above exploratory experiments led to tentative conclusions about the temperature distribution in the "burn" core. 1 ref., 14 figs.

29819 (DOE/METC—85/13, pp 645-667) **Relative supply prices for non-conventional Canadian domestic oil.** Chow, E.S.Y. Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

Oil supply from conventional sources in Western Canada has been declining as reserves have been depleted. In 1983, supply from these sources accounted for about 91% of total Canadian domestic requirements (1,353,000 bbl/d), but is expected to decline to about 45% by the year 2000. Currently, Canada is self-sufficient with a small surplus of 100,000 bbl/d being exported. However, with the rapid decline in conventional supply, this situation could change if new oil supplies are not developed in the near future. The supply prices and the relative commercial attractiveness of five non-conventional Canadian sources of oil are discussed. These are: in-situ enhanced bitumen and heavy oil production from the oil sands and heavy oil deposits in Alberta and Saskatchewan; combined in-situ production and upgrading of bitumen and heavy oil; integrated mining/upgrading synthetic production from the Athabasca oil sands; light oil production from the East Coast offshore frontier; and light oil production from the Beaufort Sea and Mackenzie Delta. A short description of the definition and use of supply prices is given, followed by a discussion of the relative attractiveness of oil production from these five sources.

29820 (DOE/METC—85/13, pp 150-164) **Process development in in-situ recovery of bitumen from oil sands.** Nguyen, D.M.; Prowse, D.R.; Heidrick, T.R. (Alberta Research Council, Edmonton). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

The Alberta Research Council has played a major role in developing the technology of recovering bitumen from Canada oil sands deposits. Initially the Karl Clark Hot Water process was developed for oil recovery from mined sands. More recently, efforts have focused on in situ methods suitable for deposits that are too deep to be profitably mined. The methodology involves both physical and numerical models. A recovery process is first characterized in physical simulators where recovery mechanisms are identified and studied. Mathematical representation of the process is then built into a numerical model along with measured physical parameters. The model, once validated by physical simulator results, is used to project the performance of the process in a field pilot situation. A description of the various physical and mathematical models are given along with the latest development in parameter measurements. The interlocking and complimentary roles of physical, mathematical models and parameters in the development of recovery processes are discussed.

29821 (DOE/METC—85/13, pp 165-185) **Physical simulator for horizontal well.** Coates, R. (Alberta Research Council, Edmonton). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

Laboratory simulation of a steam stimulation process using a horizontal well implanted into a tar sands formation was required in order to support field projects. Use of liquid solvents and non-condensable gases as additives, in conjunction with steam was regarded as another part of the experimental study. A double walled, 1 m long, pressurized Hassler-type cell was designed in order to simulate overburden pressure on the tar sands. Actual tar sand was used and packed around a scale-reduced horizontal well. The major subsystems of the physical simulator, the complex data processing, and the software used to compare different runs are described.

29822 (DOE/METC—85/13, pp 187-204) **Laboratory simulation of bitumen recovery by steam stimulation of horizontal wells.** Toma, P.; Redford, D.; Livesey, D. (Alberta Research Council, Edmonton). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

A laboratory investigation into the variable parameters which influence production of bitumen from a horizontal well was carried out. A reduced scale model of a portion of a horizontal well in an oil sand formation was reproduced in the laboratory. A double walled, pressurized Hassler-type cell was used to simulate overburden pressure on the oil sands. Actual Athabasca oil sand was used. The simulator was fully instrumented and a cyclic stimulation operating procedure was used to produce the bitumen. Steam-alone and steam in conjunction with solvents and noncondensible gases were tested. Alternate production schemes were studied and variations in the completion of the well were made. Observations made during fourteen different experiments are summarized. A linear regression model using nine parameters measured during the runs is presented. This model correlates recovery with: the heat injected, axial pressure loss, percent of slot area in the well, the grain size of the oil sands used, the initial rate of recovery, and the type of additives used with steam. The relative importance of each of these parameters on bitumen recovery is quantified and discussed. Of special interest is a model of bitumen recovery which involves a radial and an axial driving mechanism. The radial mechanism relates recovery of bitumen to bulk condensation and flashing of the steam. The axial driving mechanism is related to pressure drop encountered by steam and liquids flowing through a long open well or a natural fracture. The relative magnitude and the influence of these two mechanisms on recovery is discussed.

29823 (DOE/METC—85/13, pp 205-230) **Laboratory investigation of the steam displacement process in a Utah tar sand.** Romanowski, L.J. Jr.; Thomas, K.P. (Western Research Institute of the Univ. of Wyoming Research Corp., Laramie). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

Laboratory experiments are being conducted to study the potential of high pressure (350-1000 psig) steam displacement as an oil recovery process for Utah tar sand. These one-dimensional displacement experiments are designed to identify the relationships between the recovery efficiency and the processing conditions for two grades of tar sand representing different reservoir properties. The processing variables are the steam flowrate and initial tar sand preheat temperature; the controlled reservoir properties are the saturated permeability, porosity, bulk density, and the initial oil saturation. Crushed samples of tar sand were uniformly and consistently packed to physical properties closely resembling reservoir conditions. This was accomplished using an automated pneumatic-hydraulic tube packing apparatus. Tar sand containing 7.7 or 11.4 wt.% bitumen was packed to permeabilities ranging from 70-1100 millidarcies with oil saturations of 45-70% of pore volume (PV). The corresponding porosity ranges from 32-36%. Preheat temperatures from 215-475°F were initially established before saturated steam was injected at flow rates of 4.5-14.5 cc/min with a controlled backpressure of 360-390 psig. Results are presented from fifteen experiments, including the determination of various chemical and physical properties of the bitumen and the thermally produced oils. In addition, results and operating conditions related to the automated tube packing apparatus are discussed.

29824 (DOE/METC—85/13, pp 231-248) **Use of CO_2 with steam in bitumen recovery from oil sands: effect of injection strategies.** Nasr, T.N.; Nguyen, D.M.; Prowse, D.R. (Alberta Research Council, Edmonton). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

Studies have been carried out at the Alberta Research Council to investigate the use of steam and steam-additive processes for the recovery of bitumen from oil sand reservoirs. Results are presented from experiments in which steam-CO_2 was utilized in a three-dimensional, 2-well physical simulator. Three injection modes were investigated. These included continuous co-injection, cyclic co-injection/drawdown and a combination of CO_2 injection/soaking and cyclic steaming. The influence of injection modes on recovery was assessed. In all cases studied, the addition of CO_2 to steam resulted in improved utilization of injected energy. The improved oil recovery is also believed to be due to an improved conformance of the process rather than a lower residual bitumen saturation in the swept zone. Solution gas drive would appear to be the major beneficial mechanism in steam-CO_2 cyclic processes. This is demonstrated by a much higher recovery during pressure depletion cycles. The study indicates that, on the basis of unit weight of injected steam or injected energy, the CO_2 injection/soaking mode appears to be superior to all other modes. In this latter mode, time sequencing between CO_2 injection/soaking and cyclic steaming is found to play an important role in the final recovery. Better recovery was obtained in one particular sequence even though a much lower steam injection rate was used.

29825 (DOE/METC—85/13, pp 263-290) **Heavy oil from Kentucky tar sands via a wet combustion process.** Ward, C.E.; Ward, G.D. (Ward Douglas and Company, Inc., Marbledale, CT). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

While the world resource base of tar sands, bitumen or heavy oil is extremely large, improved technology is needed to effectively develop this resource base as a source of petroleum products. The development of an improved in situ wet combustion process for the production of heavy oil from tar sands in the Big Clifty formation of Western Kentucky is discussed. A one acre inverted 7-spot pattern was constructed in the summer and fall of 1981, and through March of 1983 6005 barrels of 10 API oil were produced, representing 22.5% of the oil-in-place on the one acre pattern. Very satisfactory production rates and air/oil ratios were achieved. Ultimate recovery using this improved wet combustion technology is estimated at approximately 50% of oil-in-place. Heavy oil production costs, including investment amortization and interest, of $13-$17/barrel are projected for production of heavy oil from the Kentucky tar sands using this approach. A commercial facility in Edmonson County based on improved technology developed from the pilot data is being planned. This project, to be built in stages, will consist initially of five 1000 B/D modules for a total capacity of 5000 B/D. The technical approach used on this project should have significant potential for application to other heavy oil or bitumen deposits.

29826 (DOE/METC—85/13, pp 291-343) **Application of TG concepts to in-situ combustion processes in tar sands.** Wayland, J.R.; Lee, D.O.; Massis, T.M. (Sandia National Labs., Albuquerque, NM). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—). Contract AC04-76DP00789.

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

Analysis of post operation core samples from in-situ combustion projects can be aided by the use of thermal gravimetric analysis (TG) techniques. Identification of specific processes and chemical reactions is possible by use of a combined TG and modeling of isothermal reactions. Samples taken from both original formation material and extracted oil at locations in front of, at, and behind the combustion front in a combustion tube experiment are first investigated using TG. From the thermograph peaks, specific reactions are identified. Weight loss curves at isothermal conditions corresponding to these peaks are analyzed to identify the reaction mechanism. Thermographs from post operation core samples are then used to indicate which combustion processes occurred within the core.

29827 (DOE/METC—85/13, pp 344-362) **Tar sand analysis.** Whitebay, L.E. Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

The realization that steamflooding can alter tar, leaving behind a toluene-insoluble fraction, has led Conoco to modify their approach to tar sand analysis. Conoco has improved the accuracy of the core analyses used to evaluate tar deposits, and gained insight into changes in tar properties during steaming. The work shows that to accurately evaluate a tar sand resource pre- and post-steamflood cores need to be analyzed. Pre-steamflood cores should be analyzed by the Dean-Stark extraction method. Selected samples (one every five feet) should be analyzed to determine the insoluble tar (organic carbon) present in the original tar. Post-steamflood cores should also be analyzed by the Dean-Stark method, however the organic carbon measurement should be made on a foot by foot basis. The combination of the Dean-Stark and the organic carbon data give a complete picture of the tar resource both before and after steamflooding.

29828 (DOE/METC—85/13, pp 516-539) **Mined oil sands bitumen extraction.** Houlihan, R.; Williams, K.; Evans, R.G. (Energy Resources Conservation Board, Calgary, Alberta). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

The Alberta mineable oil sands resource is extensive and existing commercial operations have demonstrated the technical and economic feasibility of the present technology. However, the technology utilized, particularly the bitumen extraction process, has a number of serious drawbacks with regard to bitumen recovery, energy efficiency, tailings sludge accumulation, and make-up water requirements, particularly when lower grade ores are processed. In accordance with its obligations to ensure orderly, efficient development of energy resources in Alberta consistent with sound environmental protection, the Alberta Energy Resources Conservation Board (ERCB) has expressed its concerns with existing oil sands processing technology and stressed the need for improved technology for processing mined oil sands. The ERCB has continued to prompt investigation of improved technology and to study improvements which develop. The purpose of this work was to present the results of a recently completed study, commissioned by the ERCB, concerned with improved methods of extracting bitumen from mined oil sands.

29829 (DOE/METC—85/13, pp 363-387) **Viscosity of heavy oil and bitumen which contain subsaturation concentrations of carbon dioxide.** Briggs, J.P.; Puttagunta, V.R.; Khiamel, N.B. (Alberta Research Council, Edmonton). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

Viscosity measurements using a high pressure rotational viscometer were made on oil samples obtained from the Lloydminster and Cold Lake deposits in Canada. The effect of dissolved carbon dioxide, pressure and temperature on the viscosity of these samples was determined. A general equation was developed to correlate the experimental viscosity data with the concentration of carbon dioxide in solution, the temperature and the pressure.

29830 (DOE/METC—85/13, pp 388-405) **Application of carbon-13 and proton NMR to the average structure analysis of Athabasca, Santa Rosa, and Asphalt Ridge tar sand bitumens.** Dalling, D.K.; Bailey, B.K.; Ursenbach, W.O. (Univ. of Utah Research Institute, Salt Lake City). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

Carbon-13 and proton nuclear magnetic resonance have seen increasing use as tools for analysis of complex hydrocarbon mixtures. Various schemes have been proposed for partition of chemical shift ranges into characteristic regions, and the resulting integration data has been used to calculate various average structure parameters. An optimized set of parameters were chosen which are based on minimum assumptions, and which are suited to the postulation of average structure model compounds. Appropriate computer software was written. The resulting analysis is applied to data obtained for Athabasca, Santa Rosa and Asphalt Ridge tar sand bitumens, and model compounds are developed. Simulated data from the models is then subjected to the same analysis demonstrating the accurate representation which the models make of the original mixtures.

29831 (DOE/METC—85/13, pp 406-419) **Distributions of nitrogen functional groups in Utah tar sand bitumen and produced oils.** Holmes, S.A.; Thompson, L.F. (Western Research Institute, Laramie, WY). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

Qualitative and quantitative analyses of nitrogen functional groups in solvent-extracted bitumen and produced oils from the Northwest Asphalt Ridge (Utah) tar sand deposit have been completed. Although chemical and physical properties of produced oils (a reverse/forward combustion project and a steamflood project) were different, the distributions of nitrogen functional groups in these oils were similar. In each oil about 65% of the nitrogen content was nonbasic and very weak base, comprised mostly of amide and indole-type nitrogen. About 30% was weak base, comprised mostly of pyridine-type nitrogen. It is suggested that the nitrogen compounds in these oils are different primarily in the amounts of aromatic/aliphatic hydrogen and carbon and not in the distributions of nitrogen functionalities. Significant differences were found in the hydrogen- and carbon-type distributions in these oils. In situ processing conditions used to recover oil may predominately affect the non-nitrogen moieties in the produced oil.

29832 (DOE/METC—85/13, pp 420-438) **Upgrading Utah tar sand bitumen to syncrude.** Bunger, J.W. (Univ. of Utah, Salt Lake City). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

Upgrading of tar sand bitumen to refinery acceptable crude requires a reduction of molecular weight and a reduction of heteroatoms and metals to acceptable levels. Candidate processes for upgrading include visbreaking, coking, catalytic cracking or hydrocracking, and thermal hydrocracking (hydropyrolysis). Catalytic hydrotreating may be used in combination to remove heteroatoms and metals. Inspection of the molecular structure of Uinta Basin Utah bitumen shows that molecules are of high molecular weight, with a high percentage of molecules containing heteroatoms. However, H/C ratios of 1.6 indicate that the vast majority of carbon present is saturated and therefore is susceptible to cracking. Processes which enhance the rate of cracking while inhibiting dehydrogenation and aromatic condensation reactions are expected to produce high yields of distillable products. Syncrude quality material has been produced from Uinta Basin bitumen by a coking/hydrotreating (C/HT) sequence and a hydropyrolysis/hydrotreating (HP/HT) sequence. C/HT produced syncrude in 64% yields with 13% noncondensible gases and 23 coke/residue as byproducts. Properties of the syncrude are 35 °API, 5 cps μ^{20}, .08% N, .02% S. HP/HT produced syncrude in 74% yields with 22% gas and 4% coke/residue as by-products. Properties of the HP/HT syncrude are 30 °API, 78 cps μ^{20}, .09% N, .03% S. In other results (which do not include a hydrotreatment) Athabasca bitumen was upgraded by hydropyrolysis in 90% yield to 19 °API liquid product. These results compare to 77% yield of 22°API liquid product for coking.

29833 (DOE/METC—85/13, pp 440-472) **Pyrolysis of the bitumen-impregnated sandstone from the P.R. Spring (Utah) deposit in a fluidized bed.** Dorius, J.C.; Hanson, F.V.; Oblad, A.G. (Univ. of Utah, Salt Lake City). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

The fluidized bed pyrolysis of bitumen-impregnated sandstones to produce hydrocarbon liquids was investigated using the bitumen-impregnated sandstone from the P.R. Spring deposit as feed-sand to the pyrolysis reactor. The P.R. Spring tar sand deposit is the second largest deposit in Utah, and is estimated to contain 4.0 - 4.5 barrels of bitumen in-place. Three distinct tar sand samples were used in this investigation because it was found that the physical and chemical properties of the three bitumens were quite different. The process variables investigated included the pyrolysis reactor temperature and the feed sand retention time in the pyrolysis zone of the reactor. The experimental data were obtained in a continuously fed, fluidized bed reactor operating in a temperature range of 773 - 923 K at solids retention times that ranged from 17-30 minutes. The reactor feed sand through-put was 2.25 kilograms per hour. The particle size of the feed-sand was 300-600 microns. The hydrocarbon liquid product yield (C_5^+ yield) generally decreased with increasing reactor temperature. Concomitant with this decline in the liquid yield, there was an increase in the light gas (C_1-C_4) yield. The liquid product yield increased slightly with decreasing feedsand retention time while the light gas yield decreased. The coke yield was insensitive to process operating variables above 798 K, however, it did appear to be a function of the origin of the feedsand. The quality of the bitumen derived liquids was significantly improved relative to the native bitumen, that is, the viscosity was reduced by four to five orders of magnitude. The API gravity of the liquid product increased from 7.8° API relative to the native bitumen and the pour point decreased from 372 K to 278 K. The volatility of the liquid product increased from 31.9 wt% to 77.2 wt% relative to the native bitumen.

29834 (DOE/METC—85/13, pp 473-506) **Thermal recovery of bitumen from tar sands.** Smart, L.M.; Seader, J.D. (Univ. of Utah, Salt Lake City). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

A two-staged fluidized-bed reactor for the thermal recovery of bitumen from Utah tar sands was constructed. This reactor is a scaled-up version of an earlier system investigated at the University of Utah, and involves the use of three liquid-potassium heat pipes which thermally couple an upper pyrolysis bed with a lower combustion bed. The reactor has been studied to determine the effect of multiple heat pipes, increased feed rate, and longer duration run times. The process consists essentially of three steps. In the first step, mined and suitably sized tar sand, being fed into the reactor at a constant rate, is pyrolyzed at temperatures of 440°C to above 500°C in an inert atmosphere to volatilize and partially crack most of the contained bitumen. The vaporized products of the pyrolysis section are condensed and coalesced to give a synthetic crude oil. In the second step, coked sand, formed as a by-product in the pyrolysis reactor, is combusted with air at temperatures between 550 and 600°C. In the third step, heat is recovered from the hot spent sand leaving the combustion bed by a fluidized-bed heat exchanger using vertical copper cooling tubes. Three heat pipes are used to transfer 100% of the energy required to maintain the required temperature of pyrolysis in the upper bed. This energy is provided by the lower, combustion bed. Air is used to fluidize the combustion bed and the heat recovery bed. The pyrolysis bed is fluidized with nitrogen. Over 30 runs, with tar sand from the Sunnyside, PR Springs, and Whiterocks deposits, have been made to study controllability of the process, heat requirements, and liquid product yield with respect to process variables such as pyrolysis-bed temperature and average solids-residence times. The highest liquid yield obtained was 71 wt% of the original tar sand bitumen. Typically, coke yield is from 15 to 20 wt%, with gas yield making up the difference.

29835 (DOE/METC—85/13, pp 507-515) **Dravo solvent extraction process for tar sand: update.** Tis, D.J. (Dravo Engineers, Inc., Pittsburgh, PA). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

The tar sand deposits of Kentucky are generally situated in the south-eastern rim of the Illinois Basin along the southern boundary of the Western Coal Field Region. A recent study reports that Kentucky contains 3.4 billion barrels of oil in tar sand deposits. For comparison, total US petroleum usage in 1983 was 5.5 billion barrels. A commercial extraction process is described that is comprised of the following elements: preparation for extraction; extraction with minimum solvent recirculation, because all of the solvent fed to the extractor is usually recovered by distillation; separation of solvent from the extract, so as to produce an extract with an acceptable residual solvent content; separation of solvent from the spent solids, so as to produce spent solids with an acceptable residual solvent content; and recovery of solvent for re-use.

29836 **Health and safety hazards in synfuel technologies.** Fradkin, L.; Kremer, F.V. (Argonne National Lab., IL). *Energy Progress;* **5**: No. 1, 45-47(Mar 1985).

The development of independent, long-term sources of energy and critical raw material supply has become an economic and political necessity during the past decade as readily available domestic oil reserve is depleting and the world energy supply situation is becoming more unpredictable. Conversion of coal and oil shale to synthetic fuels, however, will be accompanied by a myriad of environmental and health problems. Even through available control technologies will be installed to control residual release, and many work practices will be implemented to reduce hazard exposure, occupational health and safety hazards are still potentially a significant problem associated with a synthetic liquid fuel facility. Potential hazards in oil-shale processing, e.g., fire, explosion, and exposure to toxic and carcinogenic material are discussed.

29837 **Geologic controls of in-situ processing of tar sands, NW Asphalt Ridge, Utah.** Sinks, D.J.; Johnson, L.A.; Fahy, L.J. *American Association of Petroleum Geologists, Bulletin;* **66**: No. 5, 630-631(May 1982). (CONF-8206143—).

From American Association of Petroleum Geologists and Society of Economic Paleontologists and Mineralogists annual convention; Calgary, Canada (27 Jun 1982).

The Laramie-Energy Technology Center completed 3 in situ oil recovery experiments from tar sands at NW Asphalt Ridge, Utah. The 3.28- to 14.75-m thick experimental tar-sand zones are in the Rim Rock sandstone member of the Mesaverde Formation of Cretaceous age. Three experiments were performed at the tract. Two combustion tests using reverse combustion and a combination reverse and forward combustion were completed in a tar-sand bed 3.28 to 3.93 m thick. The third test used steam injection on a 14.75-m thick bed. Tar-sand analyses yielded the following range of data for the 3 tests: extracted porosity, 26.1 to 31.1%; absolute air permeability, 651 to 2175 md; oil saturation, 62 to 75% pv; water saturation, 2.4 to 7.9% pv. Various geological controls can determine the effectiveness of the extraction process. These include the dip of the beds, reservoir thickness, water and oil saturation, porosity, permeability, vertical and horizontal continuity of section, confinement of zone, and potential fractures and faulting in area.

Oil sands researchers require many kinds of data ranging from bitumen saturations and particle size distribution of oil sands to measures of physical properties and composition of bitumen. Numerous analytical techniques are available to analysts to provide measurements for many properties of oil sand and bitumen. These techniques are discussed.

29839 (DOE/METC—85/13, pp 58-89) **Geotechnical properties of athabasca oil sands.** Scott, J.D.; Kosar, K.M. (Univ. of Alberta, Edmonton). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

The geotechnical properties of oil sand and heavy oil cores have been measured and analyzed for a number of years. The strength, compressibility, elastic parameter, permeability and heat transfer properties of the Athabasca oil sand are summarized and discussed. The effects of pressure, heat, and gas solubility on the individual components of oil sand: mineral grains, sand structure, and pore fluids; bitumen, water and gas are reviewed and how these effects control properties of the oil sand mass is discussed. The measured values of the compressibility of the oil sand structure and the pore pressure parameter B during sample saturation and consolidation is significant in interpretation of test results. The influence of sample disturbance, confining pressure, and temperature on the compressibility, shear strength, modulus of elasticity, and Poisson's ratio are illustrated. The influence of temperature on the hydraulic conductivity of oil sand, due to changing viscosity of the bitumen, is the major parameter to be considered when estimating changes in in situ pore pressure magnitude and dissipation. Gas exsolution may also have a major effect on the pore pressure dissipation. Analysis of temperature change effects requires coupling the heat flow analysis with the pore pressure dissipation analysis. Heat transfer properties: thermal conductivity, thermal diffusivity, and specific heat were determined in a triaxial cell where pressure, temperature, and fluid saturation can be controlled.

29840 (NIPER—20, pp 231-240) **Thermodynamic properties of organic nitrogen compounds that occur in shale oil and heavy petroleum.** 28 Feb 1985. NTIS, PC A16/MF A01. File Number DE85000122.

In NIPER annual report, 1984.

Thermodynamic studies are described on alkylpyrroles, alkylpyridines, quinolines, and related substances. New equipment developments for such studies are also described. Condensed-phase heat-capacity measurements of four of the six dimethylpyridines have been completed, and measurements are in progress on the fifth isomer. The results from these studies show that the intrinsic entropy, relative to their corresponding hydrocarbon homomorphs, of the substituted pyridines is significantly different than that of pyridine relative to benzene. The results also show that the corresponding intrinsic entropy for acridine is even more significantly different. New vapor-pressure data were determined for acridine and used in the intrinsic entropy calculations. The new results were obtained with extra care to ensure the sample was adequately outgassed and are as much as 20% lower than results that recently appeared in the literature. Equipment developments were made for all of the property measurements. A new platinum calorimeter was constructed, and progress was made on the construction of two new cryostats for condensed-phase heat-capacity measurements of reactive substances at temperatures from 4 to 523 K. New designs were developed for a combustion calorimetric system which will required one-tenth of the sample presently required but still provide the precision, 0.002%, and accuracy presently attained. New designs were also developed for a torsion-effusion vapor-pressure apparatus for the measurements of high molecular weight substances which cannot be studied with methods suitable for higher pressures. New devices were either purchased and modified or fabricated for spectroscopic cells suitable for study of high temperature vapor, and new sample-handling and cell-filling facilities were developed to ensure that oxygen could be purged and excluded from samples under study.

the 1950 Scottish Oils Ltd Provident Fund. Investigation of the Fund indicated that it would have included almost all industrial workers employed in the oil shale industry between 1950 and its closure in 1962. It is concluded that workers in the Scottish shale oil industry in its latter years were not at excess risk of skin disease, perhaps because of steps taken within the industry to reduce the known hazards of dermatitis and skin cancer. However, pneumoconiosis was a definite hazard of miners and retort workers and its presence was associated with an impairment of lung function suggestive of fibrosis and possibly emphysema as well. It is suggested that prevention of this hazard might sensibly be based on the strategy used in the coalmining industry and, in the absence of further information on dust and fume exposures of shale workers, standards as applied in coalmining should be appropriate. Radiological surveillance of dust-exposed workers, whether in mines or at retorts or tips, is recommended. 39 refs., 10 figs., 48 tabs.

29842 (DOE/ER/60036—T2-Vol.3) **Studies of the Scottish oil shale industry. Volume 3. Causes of death of Scottish oil shale workers. Final report.** Miller, B.G.; Cowie, H.; Middleton, W.G.; Seaton, A. (Institute of Occupational Medicine, Edinburgh (UK)). May 1985. Contract AC02-82ER60036. 104p. (IOM-TM—85/4). NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85013325.

The hazards of the Scottish oil shale industry are reported in three volumes. This volume addresses the cause of death for personnel in the oil shale industry. Skin cancer deaths showed a hazard significantly greater than unity. In comparing oil shale workers mortality with that of the population of 2 counties, an increase in death from bronchitis and emphysema was demonstrated. Comparisons of mortality within the study group to determine if any particular jobs in the industry were more hazardous than others showed no significant associations. There appeared to be a slight excess of prostrate cancer among retort workers. In a case-control study, no significant increase in relative hazard of lung cancer was found in association with workers or residents in areas of high shale activity. 21 refs., 4 figs., 27 tabs. (DMC)

29843 (UCRL—15682) **Health and environmental effects document for oil shale: 1984.** Gratt, L.B.; Perry, B.W.; Marine, W.M.; Savitz, D.A.; Chappell, W.R. (IWG Corp., San Diego, CA (USA)). 31 Dec 1984. Contract AC02-82ER60087;AC02-81EV10706;W-7405-ENG-48. 142p. (IWGFR—085-01). NTIS, PC A07/MF A01; GPO Dep. File Number DE85012877.

The third reported effort to analyze the potential human health and environmental risks of a hypothetical one million barrels-per-day industry has been completed as an aid in the formulation and management of a program of environmental research. The methodology for prioritizing key research needs using the risk magnitude and associated uncertainty has been established and demonstrated. The analysis focused on the recommendations of the National Academy of Science's review of the 1982 oil shale risk analysis. Human health risk measures included accident and disease occurrences, premature fatalities, and life-loss expectancies. The sulfate surrogate model was replaced by a fine-particle surrogate resulting in reduced public risks. The largest uncertainties for expected fatalities are in the occupational sector. Occupational injuries and illnesses have been analyzed for the oil shale fuel cycle from extraction to delivery of products for end use. Silicosis from the dust environment is the worker disease of primary concern, followed by other forms of pneumoconiosis, chronic bronchitis, chronic airway obstruction, internal cancer, and skin cancers, respectively. The current nuisance dust threshold limit value of 5 mg/m^3 poses a serious occupational health concern for a future oil shale industry. Research recommendations are presented based on the potential for reducing the estimated uncertainties in the risks. 173 refs., 36 tabs.

29845 (DOE/METC—85/13, pp 668-672) **Project financing.** Fletcher, A.L. (Kidder, Peabody and Company, Inc., New York, NY). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

The financing of tar sands projects is discussed. Project Financing is a term used to describe a financing program which uses the asset itself, and the returns it is expected to produce, to support the financing. It is rare for a project to stand entirely on its own from a credit point of view. The mechanisms which are used to limit the credit support provided by the sponsors are discussed, but the important distinguishing factor is the focus on the asset itself, be it a coal mine, pipeline, ship, or an electric generation station. The most common interest in project finance occurs when the facility to be financed is large enough to require several sponsors. A consortium structure undertaking a project financing allows each company to limit risk by sharing it with other companies and by shifting some of the credit burden to the asset itself. Another reason for turning to a project finance program is that the sponsoring company wants to preserve its ability to borrow under any existing lending agreements it may have and wants to avoid restrictions on its corporate financial flexibility. The third reason for turning to a project financing is that the sponsoring company cannot use tax benefits associated with a facility and wants to employ the economic value of the tax benefits in financing the project.

29846 (DOE/METC—85/13, pp 673-695) **Tax issues affecting tar sands.** Spencer, L.G. Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

There are four major areas of taxation that affect a tar sands project. They are: (1) The Crude Oil Windfall Profit Tax; (2) The Energy Investment Tax Credit: (3) Percentage Depletion Deduction; (4) The Alternative Fuel Production Credit. Each of these areas are discussed, giving an analysis of the law, its application to tar sands, and any problems that have been identified with its application to tar sands, and the current status of any efforts being made to resolve those problems.

0409 Waste Research And Management

29847 (DOE/LC/11003—1805) **Biological treatment of tar sands wastewater. Final report.** Klock, J.W. (Arizona State Univ., Tempe (USA). Coll. of Engineering). Feb 1985. Contract AC20-83LC11003. 69p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85008587.

Waste water from the combustion processing of tar sands was subjected to experimental facultative and anaerobic biological waste treatment systems. The waste was mixed with varying ratios of supplemental sewage nutrient and repeatedly cycled within each of a series of submerged filters flowing horizontally or vertically. The various systems contained from 3 to 5 filter modules utilizing either facultative or anaerobic metabolism or combinations of both. Facultative systems achieved a total of 60 to 70 percent COD reduction at a rate of 10% per day. Anaerobic systems produced similar total reductions at rates of 1.5 to 2.3% per day. 11 figs., 22 tabs.

29848 (DOE/METC—85/13, pp 560-581) **Treatment of tar sand wastewaters by means of air flotation and foam separation.** Boardman, G.D.; Nolan, B.T.; VanLeigh, L.; Bushway, M.H.; McTernan, W.F. (Virginia Polytechnic Institute and State Univ., Blacksburg). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—). Contract AS20-81LC10639.

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

In 1980, the Laramie Energy Technology Center conducted an in situ experiment near Vernal, Utah, to evaluate the feasibility of using steam to mobilize and transport hydrocarbons from tar sand deposits. The experiment demonstrated that steam purging is indeed a viable means of extracting oils, but large quantities of water would be needed to apply the method on a commercial basis. Because most of the tar sand deposits are present in arid areas the large demand for water may best be satisfied through the treatment and recycle of process waters. The work described was initiated in 1981 and was undertaken to assess the effectiveness of air flotation and foam separation operations for the treatment of the Vernal process waters. An attempt to present all of the information generated during the course of the project is not made herein due to the scope of the effort. However, the major points gleaned from the research are presented.

29849 (DOE/METC—85/13, pp 582-597) **Residuals management in physical-chemical treatment of tar sand processing wastewater.** King, P.H.; McTernan, W.F.; Kuo, J.C.J.; Collins, M.R. (Univ. of Arizona, Tucson). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

Recent research in the treatment of tar sand processing wastewaters has been successful in identifying appropriate physical-chemical processes which can be employed to treat wastewaters generated from in-situ extraction methods to levels compatible with most environmental and industrial standards. Among the various treatment methods explored, particularly satisfactory results were obtained treating a representative steam flooding wastewater with ferric chloride coagulation or single stage polymer-based foam fractionation. In each case, substantial quantities of waste residuals are generated and appropriate dewatering and disposal methods must be developed. This paper discusses recent research aimed at the definition of such dewatering and disposal methods for ferric chloride coagulation sludge and polymer-based foamate. In each case, characterization data are given, and the results of laboratory screening studies of potential dewatering processes, including centrifugation, gravity drainage, and vacuum filtration, are described. An evaluation of the leaching potential of the dewatered residuals was also conducted to determine anticipated release of selected contaminants and, thus, to define the extent to which landfill disposal is consistent with sound environmental management.

29850 (DOE/METC—85/13, pp 598-619) **Cost analysis of water pollution control during in-situ production of bitumen from tar sand.** Owen, T.E.; Humenick, M.J. (Western Research Institute, Laramie, Wyoming). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

Wastewater recovered by in-situ production of tar sand bitumen using steam drive or combustion processes must be treated prior to recycling in the process, reuse within the production facility, or discharge. Recent laboratory studies have shown biological treatment with activated sludge and reverse osmosis treatment to be potentially effective on combustion wastewater. The hot lime softening process has been used and strong acid ion exchange treatment has been proposed to treat wastewaters from commercial oil sand in-situ steam drive facilities in Canada. The estimated costs associated with the construction and operation of wastewater treatment systems for projected 20,000 barrel-per-day in-situ combustion and steam drive production facilities are presented. The treatment of the steam drive wastewater focuses on recycling the production wastewater to once-through steam generators. The treatment of the combustion wastewater focuses on discharging the effluent. The costs for wastewater treatment range from $0.08 to $2.33 per barrel of bitumen produced in mid-1984 dollars.

29851 (PB—85-157410/XAB) **Water use and reuse opportunities and costs at oil-shale plants.** (Energy and Resource Consultants, Inc., Boulder, CO (USA); Camp Dresser and McKee, Inc., Denver, CO (USA)). 20 Sep 1983. 241p. NTIS, PC A11/MF A01.

See also PB85-128718; Prepared in cooperation with Camp, Dresser and McKee, Inc., Denver, CO.

Converting oil shale into fuels marketable through existing channels requires large-scale mining and processing. The mining and processing operations will consume large amounts of water and will vary from plant to plant. Variations in types of resources and the products produced will lead to a variety of mining and processing schemes each with their own water use patterns. This report describes several of these schemes, as well as their water use and waste water production patterns, water treatment plant designs and costs, and opportunities for internal water reuse and recycling. The project analyzed the ways that water will be used, and may be reused in oil shale plants located in the Upper Colorado River Basin.

29852 (DOE/METC—85/13, pp 541-559) **Tar sand: problems in environmental assessment and management in a developing industry.** Ristau, T.K. (Univ. of Minnesota, Minneapolis). Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

Tar sand and other heavy oil deposits are known to exist throughout the world and in several areas in the US. The leading states in terms of estimated tar sand resource are: Utah (29,530 million barrels); California (323 million barrels); Texas (140 million barrels); New Mexico (57 million barrels); and Kentucky (37 million barrels). Though three of the states with large occurrences are public land states (Utah, California, and New Mexico), recent federal legislative effort directed at increasing the accessibility and exploitation of tar sand resources has been centered on the state of Utah. The single largest known occurrence of tar sand is within the Tar Sand Triangle, in southeastern Utah. A portion of this deposit lies within Glen Canyon National Recreation Area (NRA), and adjacent to Canyonlands National Park (NP). The statutory and regulatory constraints in assessing the environmental effects of tar sand leasing are discussed.

29853 (RAND/R—3040-RC) **Oil shale in the Piceance Basin: an analysis of land use issues.** Rubenson, D.; Pei, R. (RAND Corp., Santa Monica, CA (USA)). Jul 1983. Contract AC01-80PE70271. 87p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85012397.

The purpose of this study was to contribute to a framework for establishing policies to promote efficient use of the nation's oil shale resources. A methodology was developed to explain the effects of federal leasing policies on resource recovery, extraction costs, and development times associated with oil shale surface mines. This report investigates the effects of lease size, industrial development patterns, waste disposal policies, and lease boundaries on the potential of Piceance Basin oil shale resource. This approach should aid in understanding the relationship between federal leasing policies and requirements for developing Piceance Basin oil shale. 16 refs., 46 figs. (DMC)

29854 **Radiological impact of atmospheric emissions from oil shale retorts.** Gogolak, C.V. (Department of Energy, New York, NY). *Environment International;* **11**: No. 1, 57-64(1985).

The radionuclide content of various oil shales, shale oils, and retorting waste products has been studied to determine the extent to which the development of this energy resource may perturb the natural radiation environment. Nearly all of the radioactivity in the raw shale is found in the spent shale after retorting. A primary exposure pathway to the public from this radioactivity will be through the release of particulate matter to the atmosphere during various mining, crushing, and retorting operations. Since the activity of this material is close to that of normal soil, however, the expected radiological impact is small. 26 references, 1 figure, 6 tables.

29855 (DOE/METC—85/13, pp 622-644) **Economic impacts of proposed changes to the Federal Tar Sand Leasing program.** Aiken, R.J. Feb 1985. NTIS, PC A99/MF A01. File Number DE85001994. (CONF-8406127—).

From WRI/DOE tar sands symposium; Vail, CO, USA (27 Jun 1984).

On May 24, 1982, the first component of the Federal Tar Sand program, regulations governing the conversion of existing oil and gas leases to combined hydrocarbon leases, were issued. These regulations, together with later regulations governing competitive leasing, set the general framework of the Federal leasing program and allowed the implementation of the program to begin. However, as both industry and government began to plan for the emerging industry, deficiencies in the legal and regulatory framework, which threaten the viability of a mature tar sand industry, became apparent. In an attempt to rectify these deficiencies, the Department of the Interior has been considering possible regulatory changes to the program. These changes were discussed at a public meeting held in Salt Lake City on February 23, 1984. Since that time, the Bureau of Land Management (BLM) has been quantifying and assessing the economic impacts associated with the proposed regulatory changes and its alternatives. The results of that analysis and the assumptions upon which it was based are summarized.

29856 (DEMO—83/2G) **Detailed investigation of ten small field areas with high radioactivity at the Serres Basin.** Kyrtsou, C. (Democritos Nuclear Research Center, Athens (Greece)). Mar 1983. 11p. (In Greek). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701222.

This report refers to ten field areas in the whole Serres Basin which, following previous radiometric and geochemical prospecting, show some interest from the uranium mineralization point of view. Detailed radiometric measurements are briefly described. In comparison with the background these field areas did not show any district radioactivity. Out of this investigation only eleven field locations with high radioactivity related to the background have been pointed out. These field locations are marked on the map by the characteristic symbols CK_{171} to CK_{181}.

29857 (ERP/MSL—83-39, pp 1-10) **Status report on Kidd Creek Aquitaine project in Nova Scotia.** John, R. (Kidd Creek Mines, (Canada)). Mar 1983. NTIS (US Sales Only), PC A11/MF A01. File Number DE85701198. (CONF-8205300—).

From Canadian Uranium Producers' Metallurgical committee meeting; Bancroft, Ontario, Canada (19 May 1982).

The Kidd Creek uranium deposit was found about 50 km northwest of Halifax, Nova Scotia as a result of geologists acting on the theory that Nova Scotia is geologically a part of Europe. Ore grades run between 0.1% and 0.2%. The site appears suitable for mining. Further development awaits the results of hearings being held throughout the province. Public opposition to the project appears to be strong.

29858 (GSCAN-P—84-1A, pp 53-55) **Radioactive equilibrium studies on four Canadian uranium reference ores.** Grasty, R.L.; Dyck, W. 1984. NTIS (US Sales Only), PC A99/MF A01. File Number DE85780943.

In Current research. Part A.

Four Canadian uranium reference ores were analyzed for their radium-226 and polonium-210 content. Radium-226 was measured both by gamma-ray spectrometry and by a radon emanation technique. Polonium-210 was determined by alpha-spectrometry. A comparison of the recommended uranium values with the measured polonium and radium content showed that within the accuracy of the measurements the four ores are in radioactive equilibrium.

29859 (GSCAN-P—84-1A, pp 129-145) **Selected mineral associations in radioactive and REE occurrences in the Baie-Johan-Beetz area, Quebec. A progress report.** Rimsaite, J. 1984. NTIS (US Sales Only), PC A99/MF A01. File Number DE85780943.

In Current research. Part A.

This paper documents results of rapid chemical, spectrographic, scanning electron microscope, semiquantitative energy dispersive spectrometer, and neutron activation analyses for uranium content of minerals and host rocks for the following associations of primary and secondary minerals: 1. metasediments grading to garnetiferous feldspar pegmatites containing mafic zenoliths; 2. fergusonite-bearing pegmatite and rock-forming feldspars and micas; 3. biotite-hornblende gneiss hosting white radioactive pegmatites containing titanite, allanite and bastnaesite; 4. granite pegmatite containing associations of primary and secondary Pb, Ti, Nb, Th, U and Y minerals; 5. syenite pegmatite containing biotite, uraninite, uranothorite, zircon, apatite, allanite, xenotime, monazite, hydroxylbastnaesite and secondary amorphous phyllosilicates and U, Zr and REE mineral aggregates.

29860 (GSCAN-P—84-1A, pp 229-238) **Gold, tin, uranium and other elements in the Proterozoic Nonacho sediments and adjacent basement rocks near MacInnis Lake, District of Mackenzie.** Maurice, Y.T. 1984. NTIS (US Sales Only), PC A99/MF A01. File Number DE85780943.

In Current research. Part A.

Heavy mineral layers in a pink arkose-quartz-rich conglomerate unit of the Nonacho Group contain notable amounts of U, Th, Sn, Nb, Ta and Au. Enrichment in Th, Sn, Nb, Ta and to a lesser extent in U is related to the detrital dispersal and accumulation of thorite-uranothorite, cassiterite and a suspected but undetected Nb-Ta mineral. These minerals probably originated from sources to the west of the Nonacho basin. in the Fort Smith belt. The clastic minerals are consistently enriched in the heavy mineral layers throughout the arkose-conglomerate unit although Sn appears to be more concentrated towards the base of the sedimentary pile. A decline in the concentrations of the various clastic minerals from south to north is also apparent and reflects increasing distance from source. Hydrothermal enrichment in U and Au is super-imposed upon the detrital pattern in the arkose-conglomerate unit. This activity appears to have been confined to the area adjacent to the southeastern shore of MacInnis Lake and is probably related to hydrothermal activity that led to the formation of nearby U-Cu-Au-Ag veins in basement rocks as well as in Nonacho Group sediments. Uranium is believed to have precipitated in the intergranular spaces of heavy mineral layers in the arkose-conglomerate unit as a result of interaction with Ti compounds and/or in response to reducing conditions associated with the presence of magnetite. Gold is more erratically distributed and is not confined to the heavy mineral layers.

29861 (PER—81, pp 17-20) **U-Pb isotopic evidence pertaining to the age and genesis of uranium mineralisation in Karoo sediments.** Allsopp, H.L.; Welke, H.J.; Armstrong, R.A.; Clough, W.; Evans, I.B. (University of the Witwatersrand, Johannesburg (South Africa). Bernard Price Inst. of Geophysical Research). Jan 1984. NTIS (US Sales Only), PC A04/MF A01. File Number DE85780942. (CONF-8311245—Absts.).

From Symposium for researchers in nuclear geology; Pretoria, South Africa (23 Nov 1983).

Preliminary investigations have been carried out, using the uranium-lead isotopic method, on the uranium mineralisation that occurs within the Karoo sediments. Two occurences were studied, namely the lower Beaufort sediments (Adelaide Subgroup) in the Beaufort West area and the Molteno Formation sediments in the

Ficksburg area. The objectives were to determine the age of the mineralisation and to study the mode of formation of the ores. The pattern of U-Pb apparent ages for all the Karoo samples is $^{207}Pb/^{206}Pb$ age >> $^{207}Pb*^{235}U$ age > $^{206}Pb*^{238}U$ age.

29871 **(DEMO—82/7G) Report on the geological-geochemical research carried out within the area of geochemical anomaly P_7, Vathyrema, Drama Department.** Stavropoulos, A. (Democritos Nuclear Research Center, Athens (Greece)). Aug 1982. 29p. (In Greek). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701218.

The investigated area covering about 30 km² is situated in the crystalline massive of Rhodope (north of Drama deparment, E. Macedonia) where granitoids constitute its main petrological type. The geological-geochemical and radiometric investigations carried out so far in the area have localized a large number of places with high values of γ-radiation (1.000 - 15.000 c/s), as well as high concentrations of uranium (50-500 ppm). The uranium mineralization within the zone of oxidation is expressed by the uranium mineral autunite, accompanied by intensive hematitization-limonitization and chloritization-kaolinization, and additionally by small spots and veinlets of pyrite and galena. It seems that tectonic control exists on the uranium mineralization, since most of the anomalous concentrations of uranium are sitting along mylonite zones rich in chlorite and kaolin. There have been discerned seven more anomalous part areas which will have to be covered by geochemical stream sediment sampling (phase 3), as well as geological mapping (scale 1:5.000). The results from the research conducted within the concerned anomaly lead us to the conclusion that this area is very promising and possibilities of localization of uranium payable concentrations are very high.

29872 **(DEMO—82/8G) Report on the research so far carried out in the sedimentary basin situated east of Potamoi village, Drama Department.** Stavropoulos, A. (Democritos Nuclear Research Center, Athens (Greece)). Aug 1982. 17p. (In Greek). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701219.

This report refers to the small sedimentary basin of about 40 km² situated east of Potamoi village (north of Drama department) within the crystalline massive of Rhodope. The results of the first phase stream sediment sampling have been very promising. The localization of a great number of radiometric anomalous horizons, mainly of arkosic composition, very rich in hematite-limonite, and with small amounts of carbonaceous material was the result of a first recognizing geological and radiometric research carried out within the area concerned. The geological formation of interest consists of alternating tough beds of different composition (fine-, medium-, course-grained arkoses, conglomerates and siltstone). The strike of these beds is about E-W and their dip about 70 deg northerly. The probable age of this formation is eocenic-oligocenic. A pair of assays from horizons with high γ-radiation have shown concentrations of easily extractable uranium between 100 and 300 ppm. The results from the research so far conducted within the area concerned lead us to the conclusion that this is a very promising area and the possibilities of localization of payable concentrations of uranium in it are very high.

29873 (DEMO—83/6G) **Uranium exploration in Central and Eastern Macedonia and Thrace (Greece). Geology, scintillometry and geochemistry of the map area 2423-2422 Thrace.** Kampanellos, J.; Persianis, D. (Democritos Nuclear Research Center, Athens (Greece)). Apr 1983. 113p. (In Greek). NTIS (US Sales Only), PC A06/MF A01. File Number DE85701223.

In accordance with the agreement between the U.N. Development Programme, the IAEA and the Greek AEC, carborne scintillometer, ground scintillometer and geochemical stream sediment surveys, along with reconnaissance geological mapping, have been carried out in the area of map sheets 2423-2422 (Iasmos, Komotini department, Thrace). The results of these surveys, presented in a series of 15 maps, indicate that six areas totalling 356 km^2 will require further detailed examination in order to test their potential of economic uranium deposits. Three of these areas, Melitena, Medousa and Nimfea, covering in total 143 km^2, should be given first priority and be further tested by detailed stream sediment and bank soil gas sampling, detailed ground scintillometer measurements, grid soil sampling and radon soil gas sampling, as well as by detailed geological mapping.

29874 (DEMO—83/13G) **Report on geological surveys of Vrondou area.** Taousianis, A.; Kyrtsou, C. (Democritos Nuclear Research Center, Athens (Greece)). Sep 1983. 58p. (In Greek). NTIS (US Sales Only), PC A04/MF A01. File Number DE85701221.

The performed research work covered Lalias subarea (A) and Ano-Kato Vrondou and Vathytopos subareas (B). In case A the investigation aimed to the delineation of a quartz vein located in a fault zone with normal high radioactivity. In order to trace the direction of the fault or secondary fault directions with similar radioactivity a grid system (scale 1:500) was set up where the following methods have been applied: scintillation counter radiometry, values of 3rd minute radon (α-radiation) measurements, proton magnetometer measurements and geochemistry with soil sampling from the grid point. Furthermore eleven trenches have been excavated from which rock samples have been taken. The results of the research are the discovery of secondary uranium bearing minerals and the determination of the fault length then was found to be 460 m; the anomalous area, with regard to radioactivity, is 60.000 m^2. Detailed prospecting in the anomalous area and borehole drilling on the anomalous locations are proposed. In case B the performed work consists of stream sediment followup geochemical with radioactivity measurements on the sampling points. 756 geochemical samples have been collected from the Ano-Kato Vrondou subarea (58 km^2) and 627 from the Vathytopos subarea (40 km^2). The results of the geochemical analysis have shown concentrations of easily extractable uranium up to 89 ppm for the first of these subareas and up to 50 ppm for the second one.

29875 (DEMO—83/18G) **Exploration of the possibilities of existence of a considerable uranium mineralization in the Symvolon granodiorite, Kavala Dept.** Stavropoulos, A. (Democritos Nuclear Research Center, Athens (Greece)). Dec 1983. 36p. (In Greek). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701461.

The investigated area (approx. 200 km^2) is confined within the limits of the strongly blastomylonitic Symvolon granodiorite. The effort made at this stage of research aimed first at the interpretation of the geochemical and radiometric anomalies resulted from earlier phases of exploration and second at the determination of the importance degree of the area. A large number of radiometrically anomalous zones, mainly in the NE part of the granodiorite, was localized, striking NW-SE and confined within fractures containing pyrite, in part or totally altered into hematite or limonite. Rock assays and phasmatometry results (γ-radiation) have shown that the high values of gross γ-radiation are due to uranium and also that a satisfying grade of chemical equilibrium exists in the area. Rock samples collected from anomalous zones and analyzed for total uranium gave values between 15 ppm and 400 ppm. The results from the present phase of research have shown that, mainly in the NE part of the area, a tectonic control of the uranium mineralization (along fractures striking NW-SE) is present and also that there may exist considerable uranium concentrations.

29876 (GSCAN-P—84-1A, pp 39-51) **Uranium deposit research, 1983.** Ruzicka, V.; LeCheminant, G.M. 1984. NTIS (US Sales Only), PC A99/MF A01. File Number DE85780943.

In Current research. Part A.

Research on uranium deposits in Canada, conducted as a prerequisite for assessment of the Estimated Additional Resources of uranium, revealed that (a) the uranium-gold association in rudites of the Huronian Supergroup preferably occurs in the carbon layers; (b) chloritized ore at the Panel mine, Elliot Lake, Ontario, occurs locally in tectonically disturbed areas in the vicinity of diabase dykes; (c) mineralization in the Black Sturgeon Lake area, Ontario, formed from solutions in structural and lithological traps; (d) the Cigar Lake deposit, Saskatchewan, has two phases of mineralization: monomineralic and polymetallic; (e) mineralization of the JEB (Canoxy Ltd.) deposit is similar to that at McClean Lake; (f) the uranium-carbon assemblage was identified in the Claude deposit, Carswell Structure; and (g) the Otish Mountains area, Quebec, should be considered as a significant uranium-polymetallic metallogenic province.

29878 (NP—5900964) **Geological investigation of uranium resources.** (Korean Inst. of Energy and Resources, Seoul (Republic of Korea)). 1983. 152p. (In Korean). NTIS (US Sales Only), PC A08/MF A01. File Number DE85900964.

A geologic investigation of the Ogcheon uraniferous black shale has been carried out at the northeast of Miweon. Geology of the study area consists of following stratigraphic sequences in ascending order pebbly phyllitic rock formation, lower black slate formation, lower sandy phyllite formation, middle black slate formation, middle sandy phyllite formation, upper black slate formation, quartzite formation and upper sandy phyllite formation. These sequences are at the central part of the Ogcheon group rocks. The uraniferous black slate is interbedded in the middle black slate formation, but the uranium content is generally lower than the same horizon of the formerly investigated area during 1977 to 1978. Most of the middle black slate formation in this area was recognized to be barren zone except the Norumok outcrop (62-325 ppM Uranium). A trace element geochemistry was supplemented to study the genesis of the uranium deposits which was surveyed previously. Chemical analysis of the 26 uraniferous black slate samples from the Hanseong adit and Buk-2 adit reveals the following elements. The range of contents is (in ppM): U 6-630, V 323-10777, Mo 70-1200, Ni 95-650, Cu 60-250, Zn <100-6500, Ba 700-9500, Ag <1-18, Ga < 10-15, B < 50, Be 1.2-4, Cd 27-163, Co < 10-50, Cr 60-380, Pb < 40-290, Sn < 10, Sr 30-320, Rb 65-200, Zr 100-400, Th < 5-15. Statistically, correlation coefficient calculations have been used in determining the paragenesis of element in the uraniferous black slate. Autoradiographic studies and observations of graphic slate from Buk-2 adit suggest that uranium was syndepositionally introduced into the graphitic carbonaceous layers. The study also indicates that segregated veinlets in high grade ore zone, composed of quartz, calcite, mica, and sulfide have nothing to do with uranium mobilization in this sample.

From Symposium for researchers in nuclear geology; Pretoria, South Africa (23 Nov 1983).

The review deals with the need for knowledge of uranium geology and exploration techniques. The review mainly focuses on

BEST COPY AVAILABLE
FOR REPRODUCTION

radon techniques and closely related aspects. The use of radon as a prospecting tool is primarily based on the fact that it is an inert gas, and threfore, has the ability to migrate through cracks and porous media. The methods used in radon prospecting are based on the detection of α or γ-radon produced during the radioactive decay of Rn and/or Rn decay daughter isotopes. The methods can be described as either active or passive. The active methods involve pumping of soil gas from a narrow hole drilled in the ground and suitably covered, into or through a detector instrument, whereas the passive methods register Rn concentrations in the ground under natural conditions. In uranium exploration the aim is to distinguish areas with enhanced radon concentrations in relation to background levels.

From Symposium for researchers in nuclear geology; Pretoria, South Africa (23 Nov 1983).

A radiometric survey of the Karoo are described. To expedite the survey systematically, the Karoo and parts of Natal were divided into seventeen blocks; ground follow-up of aerial radiometric anomalies was also carried out. It was found that the majority of the uranium occurrences are located in fluvial sandstone of the Beaufort Group, particularly the Adelaide Subgroup. Uranium also occurs in baked mudstone and shale.

29881 (PER—81, pp 34-37) **Review of current research problems and future trends with regard to geophysical methods in uranium exploration.** Andersen, N.J.B. (Nuclear Development Corp. of South Africa (Pty.) Ltd., Pelindaba, Pretoria). Jan 1984. NTIS (US Sales Only), PC A04/MF A01. File Number DE85780942. (CONF-8311245—Absts.).

29884 (GAT-E—279) **Study of mass and momentum transfer and their effect on the direct fluorination of uranium oxide.** Cross, P.E. (Goodyear Atomic Corp., Piketon, OH (USA)). 25 Feb 1983. Contract AC05-76OR00001. 155p. NTIS, PC A08/MF A01; 1; GPO Dep. File Number DE85012823.

The mechanism for the fluorination of solid U_3O_8 to gaseous UF_6 was found to be a two-step process with solid UO_2F_2 as an intermediate. The highest particle temperatures were found to be associated with the initial reaction step to UO_2F_2; it was recommended that these temperatures be maintained below 1700°F. The chemical equilibrium constant for the fluorination of PuF_4 to PuF_6 was found to be unexpectedly low at typical flame tower temperatures. Although not confirmed, there is an indication in the literature that a similar equilibrium constant is associated with the fluorination of NpF_4 and other transuranic molecules. It was recommended that uranium oxides which are significantly contaminated with transuranics should not be processed through a direct fluorination reactor such as the UF_6 flame tower. Reaction rate equations were developed for the fluorination of U_3O_8, UF_4, PuF_4 and NpF_4. During the course of the development, a significant discrepancy was found in the literature for the activation energy of the fluorination of U_3O_8. Equations were developed for both a high and low limit rate constant for the fluorination of U_3O_8. A variey of momentum, heat and mass transfer equations were developed for both oxide particles and the gas phase within the flame tower. Equations were developed to estimate the physical and transport properties of each gaseous component and the gas mixture as a whole. These properties and the transport equations were used to estimate the reaction time and distance for oxide particles with both the low and high limit reaction rate constant. The procedures used to perform these calculations is limited to constant temperature and an oxide feed comprised of a single particle size. The results indicate that above 1000°F the mass transfer of reactants and products becomes increasingly important to the overall rate of the reaction.

29885 (GAT-T—3334) **Automatic rotary valve actuator.** Cook, W.E. (Goodyear Atomic Corp., Piketon, OH (USA)). 28 Mar 1985. Contract AC05-76OR00001. 51p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85012797.

This report describes the design, construction, and operation of a microcomputer-controlled valve actuator for operating test valves requiring rotary motion of the valve stem. An AIM 65 microcomputer, using a FORTH language program, controls an air motor and air clutch mounted within an oven to accomplish testing at elevated temperatures. The valve actuator closes the test valve until a preset torque is reached and then opens the valve to its initial starting point. The number of cycles and extremes of rotation are tallied and printed as the test progresses. Provisions are made to accept remote signals to stop the test and to indicate to a remote device when the test has been stopped.

NTIS (US Sales Only), PC A07/MF A01. File Number DE85751131.

Thesis.

The effects exerted by separation of the heavy component and the light auxiliary gas, strong variations in the state of the gas in the direction of flow, and strong deviations from local equilibrium upon both isotope separation and pressure losses in separation nozzles are studied. The flow field and the separation of the heavy and light components are investigated. This simulation shows that the separation of the heavy component and the auxiliary gas results in a damping of isotope separation near the curved wall of the nozzle. The strong variations in the state of the gas in the direction of flow result in a large velocity slip between the components in the inner regions of flow. The examination of the local production of entropy shows that the diffusion of the heavy component through the light auxiliary gas may cause up to 30% of the total pressure losses.

(Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 7p. (CONF-850556—5). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012697.

From 7. symposium on safeguards and nuclear material management; Liege, Belgium (21 May 1985).

X-ray fluoresence determines the amount of total uranium present in gaseous UF_6 inside cascade header pipes of a uranium centrifuge enrichment facility. A highly collimated source, highly collimated detector, and a very rigid, reproducible geometry are required. Two measurements of the 185.7-keV gamma ray from ^{235}U using two collimators determine the amount of ^{235}U present only in the gas phase. The ratio of the gas-only ^{235}U signal to the total uranium gas-only signal is directly proportional to the enrichment of the process UF_6 gas. This measurement technique is independent of the deposit that forms on a surface in contact with UF_6. This measurement technique is independent of the pressure of the gaseous UF_6. This technique has the required sensitivity to determine whether the process gas is of uranium enrichment $\leqq$ 20% or >20%. 6 refs., 4 figs., 4 tabs.

29888 **(K-Trans—299) Process and device for forming imprints on ceramic tubes.** (Oak Ridge Gaseous Diffusion Plant, TN (USA)). 1985. Contract AC05-84OT21400. Translation of French Patent [Application] No. 78 33446, November 27, 1978. 18p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013137.

The purpose of the present invention is a process and a device for making imprints on ceramic tubes and these ceramic tubes with imprints. It is known that in uranium enrichment processes by gaseous diffusion, microporous tubes are used to made the diffuser units used for the application of this isotope enrichment process. It is known that these microporous tubes are generally made in two stages. In a first stage, a macroporous ceramic tube called a "support" is made. In a second stage, an internal microporous deposit is made which makes it possible to obtain a tube called a "barrier" finally having the required porosity to apply the gaseous diffusion enrichment process. The present invention involves the first stage of the manufacturing process of the barriers and, more precisely, a step in the manufacturing process of the supports that makes it possible to improve the efficiency of these barriers.

29889 **Method for controlling the viscosity of siloxane oils.** Carey, A.A.; Shor, J.T. (to Dept. of Energy). US Patent Application 6-649,623. 12 Sep 1984. 8p. Contract AC05-84OR21400.

This invention relates to a method of controlling the viscosity of siloxane oils in the presence of lead by adding a small amount of a dione such as p-benzoquinone or 2,3-butanedione.

29891 **(BARC—1224) Radiochemistry Division annual progress report for 1982.** Bhargava, V.K.; Rao, V.K. (eds.). (Bhabha Atomic Research Centre, Bombay (India). Radiochemistry Div.). 1984. 122p. NTIS (US Sales Only), PC A06/MF A01. File Number DE85900986.

This report gives an account of the work in the areas of nuclear fuels, solution chemistry and solid state chemistry of actinides, radioanalytical chemistry and nuclear chemistry. Studies have been made to optimize chemical parameters for the preparation of UO_2 and ThO_2 microspheres. A preliminary design has been made for the setting up of an engineering scale facility for the production of $(U,Pu)O_2$ gel particles. Synergic extraction studies of various actinides from aqueous solutions have been carried out and nature of species formed established. Double sulphates of U(IV) and Pu(IV) with K and Rb have been prepared, isolated and characterized by chemical, x-ray, infra-red and thermal methods. ^{241}Am has been determined in dissolver solution, using ^{233}U as a reference nuclide by alpha spectrometry. Plutonium in dissolver solution has been determined by IDMS using ^{239}Pu as a spike. Studies have been made on isotope fractionation in thermal ionization mass spectrometry of plutonium. With the availability of the Variable Energy Cyclotron at VEC, Calcutta, the main thrust in the field of nuclear chemistry has been on the studies involving charged particle induced fission. Studies have been carried out on mass distribution and fission fragment angular momentum in the 30 MeV α-particle induced fission of ^{232}Th. 72 refs., 23 figs., 28 tabs.

29892 **Latch assembly.** Frederickson, J.R.; Harper, W.H.; Perez, R. (to Dept. of Energy). US Patent Application 6-641,547. 17 Aug 1984. 13p. Contract AC06-76FF02170.

A latch assembly for releasably securing an article in the form of a canister within a container housing. The assembly includes a cam pivotally mounted on the housing wall and biased into the housing interior. The cam is urged into a disabled position by the canister as it enters the housing and a latch release plate maintains the cam disabled when the canister is properly seated in the housing. Upon displacement of the release plate, the cam snaps into latching engagement against the canister for securing the same within the housing. 2 figs.

From 9. annual actinide separations workshop; Richland, WA, USA (22 May 1985).

Savannah River Plant presently uses separate pans for filtration and roasting PuF_3 precipitates in the Pu metal finishing line. Savannah River Laboratory has developed a multipurpose pan which uses platinum filter media for filtration and roasting. 9 figs., 1 tab.

29894 (IWGFPT—20, pp 74-80) **Irradiated fuel by-product separation research in Canada.** Burston, M. (Nuclear Materials Management Dept., Ontario Hydro, Toronto (Canada)). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

Although no decision has been made to reprocess irradiated CANDU fuel, by-product separation research has recently been initiated in Canada because of its potential importance to Canadian research programs in advanced fuel cycles (especially U/Pu cycle development in the near term) and nuclear waste management. In addition, separated by-products could have a significant commercial potential. Demonstrated applications include: heat sources, gamma radiation sources, light sources, new materials for productions of other useful isotopes, etc. For illustrative purposes the calculated market value of by-products currently stored in irradiated CANDU fuel is approximately $210/kgU. Ontario Hydro has initiated a program to study the application of new separation technolgies, such as laser-based techniques and the plasma ion cyclotron resonance separation technique, to either augment and/or supplant the chemical extraction methods. The main goal is to develop new, more economical extraction methods in order to increase the magnitude of the advantages resulting from this approach to reprocessing.

29895 **(KFK—3836) Kinetic investigation of TBP-hydrolysis in the Purex system.** Becker, R.; Stieglitz, L.; Bautz, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Heisse Chemie; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Nov 1984. 56p. (In German). (PWA—76/84). NTIS (US Sales Only), PC A04/MF A01. File Number DE85751142.

The experimental conditions were selected to allow a transfer of the results of the requirements of the Purex-Process. Single phase experiments in aqueous systems were carried out at 50°C, 75°C and 90°C with nitric acid concentrations between 0,5 M/l and 6 M/l and with pure water. The temperature dependence of the hydrolysis rate constants k_1, k_2 and k_3 and the activation energy could be determined from the Arrhenius-plot. Besides in the concentration range investigated linear dependence of the rate constants on the acid concentration was found. The addition of uranium (VI) did not lead to a significant change of the rate constants. Mixed phase experiments were performed at 23.5°C, 50°C and 75°C with nitric acid concentrations of 0,5 M/l and 3 M/l. For the rate constant k_1 the temperature dependence and the activation energy were evaluated. The reaction seems to be a first order reaction with respect to the acid concentration. After the addition of uranium (VI) [approx.=35 g/l (org.)] or zirconium [1g/l (aq.)] the hydrolytic reaction rate was significantly increased. Under these conditions an influence of the nitric acid concentration could not be noticed. The formation of monobutyl phosphoric acid in mixed phase systems was also investigated. During the usual experimental time of approx.=14 days measurable H_2MBP concentrations were only found in the aqueous phase provided that there was a sufficient aqueous HDPB concentration. 18 figures.

29896 **(SKBF-KBS-TR—80-04) Helium retention. Summary of reports and memoranda.** Berggren, G. (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Feb 1980. 14p. (STUDSVIK-K—1-4-80-12). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701268.

A number of investigations of spent nuclear fuel concerning the formation and retention of helium in the fuel have been performed. The essentials of this work are presented in this review. Retention of helium in minerals is generally very low. Analogies between fuel and minerals have not been conclusively demonstrated.

0509 Transport And Storage

REFER ALSO TO CITATION(S) 29914, 29916, 29918, 29985, 30023, 30043, 31738

29897 **(EUR—9133) Mutual emergency assistance in the event of accident during transport of radioactive materials within the member states of the European Community.** Selling, H.A. (Commission of the European Communities, Luxembourg). 1984. 51p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701485.

The study consist of a compilation of information on the relevant emergency response plans that are at present in existence in the ten countries of the European Community. Consideration is given to the development of proposals for facilitating co-operation between the emergency services in different countries, particularly with regard to accidents that might occur near national boundaries or in countries in which all the necessary resources might not be available. The particular items of interest covered in this study are: compilation of information on existing organizational emergency response arrangements within each Member State relating to accidents in the transport of radioactive materials by all modes, including road, rail, inland waterways, air and compilation of information on existing arrangements for receiving or providing assistance from or to other Member States. Identification of any avoidable incompatibilities on an international scale. Recommendations for improving the existing arrangements and for encouraging the development of adequate systems of mutual emergency notification, liaison and assistance as required by the circumstances, recommendations should be compatible with the broader framework of emergency response for all types of accidents developed within Member States and envisaged in the IAEA system for mutual emergency assistance.

29898 **(EUR—9195) Stowing of radioactive materials package during land transport. Third phase.** Gilles, P.; Chevalier, G.; Pouard, M.; Jolys, J.C.; Draulans, J.; Lafontaine, I. (Commission of the European Communities, Luxembourg). 1984. 147p. (In French and English). NTIS (US Sales Only), PC A07/MF A01. File Number DE85701486.

Phase 3 of this study is mainly experimental. The study is based on the work performed during 2 former studies: phase 1: definition and analysis of reference accidental conditions, and phase 2: selection of some reference accidents and computation of the deceleration forces. The main goal of the study is to draw up a reference document, giving some guidances for the stowing of packages on conveyances for land transportation. The third phase includes four frontal impact tests. The reference package used is a French IL-37 container weighing about 1.3 t. The first test was performed using a truck, loaded with two IL-37 containers and launched at a speed of 50 km/h against a fixed obstacle. The deceleration curve the behaviour of each package and the behaviour of stowing systems are compared with the theoretical results. Various measurements were made during the test: vehicle impact speed; vehicle deceleration, measured at different points on the frame, package deceleration, displacement of attachment points. The impact was filmed from different angles. The second test was performed in the same impact conditions but with a waggon instead of a truck, and loaded with one container. The front of the waggon was equipped with special shock absorbers to obtain the same deceleration as recorded during the truck impact (first test). In the third test the stowing systems were reinforced by a nylon one in order to obtain information of stowing systems of that type and to increase the energy absorption capacity. In the fourth test in addition to being stowed the package was also chocked. The results obtained have shown that it is possible to maintain a package on a truck platform even during a severe frontal impact.

29899 **(PNL—5122) Status of rod consolidation.** Bailey, W.J. (Pacific Northwest Labs., Richland, WA (USA)). Apr 1985. Contract AC06-76RL01830. 52p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85013030.

Two of the factors that need to be taken into account with rod consolidation are (1) the effects on rods from their removal from the fuel assembly and (2) the effects on rods as a result of the consolidation process. Potential components of both factors are described in the report. Discussed under (1) are scratches on the fuel rod surfaces, rod breakage, crud, extended burnup, and possible cladding embrittlement due to hydrogen injection at BWRs. Discussed under (2) are the increased water temperature (less than 10°C) because of closer packing of the rods, formation of crevices between rods in the close-packed mode, contact with dissimilar metals, and the potential for rapid heating of fuel rods following the loss of water from a spent fuel storage pool. Another factor that plays an important role in rod consolidation is the cost of disposal of the nonfuel-bearing components of the fuel assembly. Also, the dose rate from the components - especially Inconel spacer grids - can affect the handling procedures. Several licensing issues that exist are described. A list of recommendations is provided. 98 refs., 5 figs., 5 tabs.

29900 **(SAND—84-1795) Preliminary cost and risk analysis for transporting spent fuel and high-level wastes to candidate repository sites.** Neuhauser, K.S.; Cashwell, J.W.; Reardon, P.C.; McNair, G.W. (Sandia National Labs., Albuquerque, NM (USA)). Dec 1984. Contract AC04-76DP00789. 55p. (TTC—0506). NTIS, PC A04/MF A01; GPO Dep. File Number DE85013033.

The relative costs and risks of transporting nuclear wastes to nine potential candidate repository sites are discussed. The calculations performed are consistent with previous TTC study, but the analyses have been updated to reflect programmatic assumptions about cask capacities and repository capacity in order to be consistent with the environmental assessments written under the Nuclear Waste Policy Act. Because of the complexity of the issues as well as their regional character, costs and risks should be considered to be relative indicators among the various sites. 19 refs.

29901 **(SAND—85-7161) Analysis of NEPA/CEQ requirements with respect to nuclear materials transportation. Final report.** (International Energy Associates Ltd., Washington, DC (USA)). May 1985. Contract AC04-76DP00789. 90p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85011289.

This report presents the obligations to be met by federal agencies under the guidelines and recommendations implemented by the Council on Environmental Quality (CEQ) in accordance with the National Environmental Policy Act of 1969 (NEPA). Under NEPA, federal agencies must examine environmental issues at all levels of decision making. The report discusses the intent and scope of NEPA and the CEQ, explains the criteria for agency preparation of environmental impact statements, outlines agency practice under CEQ regulations, and examines the applicability of NEPA and CEQ requirements to nuclear materials packaging and transportation. 17 refs., 1 fig.

29902 **Estimation of radiological impact from transportation of uranium mill tailings: Part II: Dispersion and dosimetry.** Yuan, Y.C.; Chee, P.C. (Argonne National Laboratory, Argonne, IL). pp 165-174 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

This paper describes a model to predict the radiation exposure from the dispersion of radon and tailings materials emitted during the remedial action. The potential radiological impacts associated with a hypothetical removal and transportation operation for an existing inactive mill tailings site over a prescribed route are presented to demonstrate the application of the model. Data on radiological parameters from an existing inactive uranium mill tailings site are used to demonstrate the computerized simulation of the model. It is determined that the described integration method can be used to calculate large-area-source and long-line-source dispersion with greater accuracy and significantly reduced computational cost.

29903 **(AERE-G—3161) AERE contracts with DOE on the treatment and disposal of intermediate level wastes. Annual report for 1983/84.** Partridge, B.A. (UKAEA Atomic Energy Research Establishment, Harwell. Chemical Technology Div.). Jun 1984. 87p. NTIS (US Sales Only), PC A05/MF A01. File Number DE85701257.

This document reports work carried out in 1983/84 under 10 contracts between DOE and AERE on the treatment and disposal of intermediate level wastes. Individual summaries are provided for each contract report within the document, under the headings: comparative evaluation of α and $\beta\gamma$ irradiated medium level waste forms; modelling and characterisation of intermediate level waste forms based on polymers; optimization of processing parameters for polymer and bitumen modified cements; ceramic waste forms; radionuclide release during leaching; ion exchange processes; electrical processes for the treatment of medium active liquid wastes; fast reactor fuel element cladding; dissolver residues; flowsheeting/systems study.

29904 **(AERE-G—3176) One third linear scale Joule Ceramic Melter - Progress report April 1983-March 1984.** Robinson, K.S.; Walmsley, D.; Sammons, B.; Hollinrake, A. (UKAEA Atomic Energy Research Establishment, Harwell. Chemical Technology Div.). Jul 1984. 26p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701254.

This report details the work on Highly Active Liquid Waste Vitrification using the one third linear scale Joule Ceramic Melter carried out in Chemical Technology Division during 1983/84. This work was commissioned by the UK Department of the Environment as part of its radioactive waste management programme.

29905 **(AERE-G—3228) Uranium series disequilibrium measurements at Mol and Whiteshell. Progress report for January-June 1984.** Ivanovich, M.; Wilkins, M.A. (UKAEA Atomic Energy Research Establishment, Harwell. Nuclear Physics Div.). Oct 1984. 4p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701516.

The current contract is funding two parallel uranium series disequilibrium studies and the aims of and the progress to date of these studies are given in this report. The larger study is concerned with the measurement of uranium series disequilibrium in ground waters derived from sand layers above and below the Boom Clay formation at Mol in Belgium. For 5 observation wells studied to date, the sand layers above the Boom Clay are characterised by low uranium content while below the Boom Clay, the sand layers are characterised by low to moderate uranium content. The second study is concerned with the measurement of the ratio of ^{226}Ra and ^{228}Ra in large groundwater samples which have been scavenged by acrylic fibres impregnated with manganese oxide from the Underground Research Laboratory at Pinawa, Canada.

29906 **(AERE-R—10269) Decontamination of α bearing waste streams using coprecipitation with ferric hydroxide in conjunction with ultrafiltration.** Knibbs, R.H. (UKAEA Atomic Energy Research Establishment, Harwell. Chemical Technology Div.). Oct 1984. 29p. HMSO, London, price Pound 4.00.

The use of ultrafiltration techniques for the treatment of radio-active waste waters is under consideration by the UKAEA. This report considers the decontamination of α bearing waste streams which also contain ferric hydroxide or have it added to enhance the decontamination process. A range of membranes and ultrafiltration equipment have been tested to ascertain flux levels and decontamination factors. Cesub((III)), Thsub((IV)) and Usub((VI)) were used to simulate plutonium and it was found that pH adjustment was necessary to achieve optimum simultaneous rejection of all three species. The paper goes on to analyse membrane fouling mechanisms and develops a model in which the rate of fouling is expressed in terms of a deposition term, dependent on flux and feed concentration modified by a parameter associated with the cross flow configuration, and a re-entrainment term dependent on cross flow velocity and the uncompressed fraction of the fouling layer.

29907 **(AERE-R—11103) Strontium removal from Magnox pond waters by ultrafiltration.** Williams, G.H.; Gutman, R.G. (UKAEA Atomic Energy Research Establishment, Harwell. Chemical Technology Div.). May 1984. 47p. HMSO, London, price Pound 5.00.

Strontium activity has been removed from Magnox pond waters by the in-situ precipitation of titanium hydroxide, and subsequent ultrafiltration to remove the strontium-loaded precipitate from the effluent. The titanium hydroxide produced in this way was sub-micron in particle size and had a high adsorption capacity.

Strontium decontamination factors in excess of 100 have been achieved after the addition of only 2g/m^3 of titanium to the effluent followed by ultrafiltration. Continuous operation of 0.1m^2 plastic, hollow fibre ultrafiltration modules has been demonstrated. After the addition of 4g/m^3 of titanium, effluent was concentrated tenfold by ultrafiltration and then further concentrated by sedimentation, the supernate being recycled to the ultrafiltration process. The overall process volume reduction factor from effluent to titanium hydroxide sludge was 500 with an overall strontium decontamination factor in excess of 100. Least membrane fouling was observed when using hollow fibres of the largest available diameter and when operating in turbulent flow. It was estimated that a membrane flux of 2m/d could, under appropriate conditions, be maintained for periods of almost 20 days. A flowsheet for the operation of a large ultrafiltration plant is discussed.

29008 **(AERE-R—11179) Cold pressed and sintered barium sulphate ceramic waste forms for direct immobilisation of medium level Magnox waste.** Jones, D.V.C.; Preston, R.F.; Briggs, A. (UKAEA Atomic Energy Research Establishment, Harwell. Materials Development Div.). Sep 1984. 24p. HMSO, London, price Pound 4.00.

The cold pressing and sintering behaviour of barium sulphate ceramic waste forms for direct immobilisation of medium level Magnox waste is described. Pellets having a density of 3.7 g cm^{-3} and containing 11.5 v/o open porosity were obtained by first cold pressing at 120 MPa and then sintering at 1300 deg C for 8 h. The leach rate derived from weight losses in Soxhlet tests were 0.5 to 3.5 x 10^{-7} kg m^{-2} sec^{-1}. They are similar to the values obtained for hot pressed barium sulphate floc having only 0.7 to 4.0 v/o open porosity. Unlike single phase ceramic materials where at constant temperature, density is found to be dependent on time, the sintering behaviour of barium sulphate floc was observed to have a short initial period where density was time dependent but then became independent of time (i.e. no further increase of density occurred irrespective of sintering time at a constant temperature).

29009 **(AERE-R—11268) Immobilisation of ^{137}Cs and ^{90}Sr in hot-pressed clinoptilolite.** Briggs, A.; Jones, D.V.C.; Cole, G.B.; Valentine, T.M.; Preston, R.F.; Hawes, R.W.M.; Fones, M.D. (UKAEA Atomic Energy Research Establishment, Harwell. Materials Development Div.). Jul 1984. 38p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701255.

It is shown that clinoptilolites from Nevada and Mudhills, California, can be vitrified by hot-pressing at 1000 to 1050 deg C for 30 min under 23 MPa pressure in graphite dies, or for 10 min under 3.5 MPa pressure in stainless steel bellows-shaped containers. Activity measurements before and after hot-pressing show that the radionuclides ^{137}Cs and ^{90}Sr are retained almost completely during the process. The hot-pressed material is shown to be extremely resistant to leaching of the nuclides, either in Soxhlet or long-term static leach tests. Gamma-irradiation increases their leachability; that of ^{90}Sr more than that of ^{137}Cs, but even so, the leach rates of both remain very low. X-ray diffraction spectra taken before and after heat-treatment for 10 days at temperatures up to 1000 deg C show no deleterious effects, and hydrothermal treatments at temperatures up to 90 deg C for 100 days, even in the presence of sodium ions in solution, are shown not to cause any changes detectable by X-ray diffraction.

29010 **(AERE-R—11287) Analysis of steady-state hydraulic tests in fractured rock.** Hodgkinson, D.P. (UKAEA Atomic Energy Research Establishment, Harwell. Theoretical Physics Div.). Jul 1984. 36p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701038.

A model for the analysis of steady-state hydraulic injection tests into single fractures of a rock-mass is presented, and solved analytically. It is used to obtain a probability distribution for the transmissivities of fractures in Cornish granite.

29011 **(AERE-R—11299) Analysis of the AECL/CEC field experiment on the transport of ^{82}Br through a single fracture.** Lever, D.A. (UKAEA Atomic Energy Research Establishment, Harwell. Theoretical Physics Div.). Jul 1984. 23p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701039.

An analysis of the joint AECL/CEC field experiment performed at the Chalk River test site in Canada in 1983 is presented. A pulse of ^{82}Br tracer was injected into a steady dipole flow field set up in a single fracture between two boreholes 10.6 m apart. A model is presented accounting for dispersal by the dipole flow field and for hydrodynamic dispersion within the fracture. The model is fitted to the experimental data of the breakthrough curve by varying a dispersion length and the water travel time along the line joining the boreholes. In addition, the predicted recovery is compared with an estimate of the actual recovery. Recommendations are made for future experiments.

29012 **(AERE-TP—1061) Review of methodologies used in safety analyses of nuclear waste disposal.** Robinson, P.C. (UKAEA Atomic Energy Research Establishment, Harwell. Theoretical Physics Div.). Jun 1984. 48p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701258.

The methodologies used in safety analyses of nuclear waste disposal are reviewed. Particular reference is made to the KBS-3 proposals and to the WP-Cave concept. These methodologies are aimed mainly at reducing uncertainties in the predictions of health consequences from nuclear waste repositories, and quantifying the uncertainties that remain. The steps of a safety analysis are described in turn and the currently used techniques are discussed. Recommendations are made as to the use and development of the techniques and the need for new techniques.

29013 **(CONF-850314—69) Monitoring of surface deformation and microseismicity applied to radioactive waste disposal through hydraulic fracturing at Oak Ridge National Laboratory.** Stow, S.H.; Haase, C.S.; Switek, J.; Holzhausen, G.R.; Majer, E. (Oak Ridge National Lab., TN (USA); Applied Geomechanics, Inc., Santa Cruz, CA (USA); Lawrence Berkeley Lab., CA (USA)). 1985. Contract AC05-84OR21400. 6p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012777.

From Waste management '85; Tucson, AZ, USA (24 Mar 1985).

Low-level liquid nuclear wastes are disposed of at Oak Ridge National Laboratory by the hydrofracture process. Wastes are mixed with cement and other additives to form a slurry that is injected into shale of low permeability at 300 m depth. The slurry spreads radially along bedding plane fractures before setting as a grout. Different methods for monitoring the location and behavior of the fractures have been investigated. Radioactive grout sheets can be located by gamma-ray logging of cased observation wells. Two other methods are based on the fact that the ground surface is deformed by the injection. The first entails surface leveling of a series of benchmarks; uplift up to 2.5 cm occurs. The second method involves use of tiltmeters that are sensitive and measure ground deformation in real time during an injection. Both methods show subsidence during the weeks following an injection. Interpretive models for the tiltmeter data are based on the elastic response of isotropic and anisotropic media to the inflation of a fluid-filled fracture. A fourth monitoring method is based on microseismicity. Geophone arrays were used to characterize the fracture process and to provide initial assessment of the feasibility of using seismic measurements to map the fractures as they form. An evaluation of each method is presented. 8 refs., 6 figs.

29014 **(DOE/DP—0020/1) Evaluation of commercial repository capacity for the disposal of defense high-level waste.** (USDOE Assistant Secretary for Defense Programs, Washington, DC). Jun 1985. 138p. NTIS, PC A07/MF A01; 1; GPO Dep. File Number DE85013230.

The Nuclear Waste Policy Act of 1982 contained a requirement for the President to evaluate the use of commercial repository capacity for the disposal of defense high-level nuclear waste. The report contains a comparative evaluation of two geologic disposal options for defense high-level waste. The two options are: (1) Dispose of defense high-level waste in a commercial repository; (2) Dispose of defense high-level waste in a defense-only repository. The Act required that the evaluation consider cost efficiency, health and safety, regulation, transportation, public acceptability, and national security. Based on the evaluation, there is a significant cost advantage, approximately $1.5 billion, for disposal of the de-

FOR REPRODUCTION

fense waste in a commercial repository rather than a separate defense repository. No other factor results in a significant advantage for selecting either option. 14 refs., 14 figs., 21 tabs.

29915 (DOE/NE/44350—1) Project profile of CRYSTL: Phase I and Phase II. (North Carolina Dept. of Natural Resources and Community Development, Raleigh (USA). Div. of Land Resources). Apr 1985. Contract FG02-83NE44350. 76p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85013412.

The US Department of Energy (DOE) plans to locate one high-level nuclear waste repository in the eastern United States by the year 2000. Current plans call for this repository to be located in crystalline rock formations. North Carolina is one of seventeen states with crystalline rock bodies that are under study. DOE is evaluating the geological aspects of the rock bodies as well as the impact a repository will have on the natural and cultural resources of the area. Funds have been granted to North Carolina from DOE to allow the state to review DOE's findings. A portion of these funds have been used to build digital geographic datasets that are being used for this evaluation and review. This report summarizes the data collected and methods used in entering them into the computer.

29916 (DOE/NV/10250—19) Commercial Nuclear Waste Research and Development Program. Quarterly report, January-March 1985. (Westinghouse Electric Corp., Mercury, NV (USA). Waste Technology Services Div.). May 1985. Contract AC08-82NV10250. 28p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012289.

Revisions requested by DOE/HQ to the plans for shipment of the fuel assemblies from E-MAD to the Idaho National Engineering Laboratory (INEL) and the subsequent shutdown of the facility were completed with all information currently available. At DOE/NV request, the shipping plan was revised to provide an option for loading the General Nuclear Services (GNS) cask with the E-MAD fuel for the Vepco Cask Storage Demonstration Test Number 4 (air-filled intact fuel). A special one-month series of Fuel Temperature Test (FTT) gas sampling operations was completed at the request of Battelle Pacific Northwest Laboratories (PNL). Their assessment of data available to date indicates that the size of the defect has not grown since the fuel rod breach occurred two years ago, and they do not expect fission product contamination inside the FTT. The Months 20 through 24 FTT temperature profiles were completed, and the two year Metal Cask Simulation Test was completed on March 11, 1985. A post-test calibration run (thermal stabilization of the fuel assembly temperatures with no heat input to the system) was performed following completion of the test. The second and third (final) sets of the three month series of gas samples were taken from the helium filled canister containing fuel assembly B41, which is suspected of having one or more defective fuel rods. The canisters containing fuel assemblies D22 and D09 were cut open. Prior to the cutting, gas and full volume filtration samples of the canister atmosphere were taken. Following cutting, integrity of the fuel was checked and documented by visual examination, photodocumentation, videotaping and by taking surface contamination swipes from designated fuel rod surfaces.

29917 (DOE/OR/21400—T126) Performance Assessment National Review Group. Lieberman, J.A.; Davis, S.N.; Harleman, D.R.F.; Keeney, R.L.; Kocher, D.C.; Langmuir, D.; Lyon, R.B.; Owens, W.W.; Pigford, T.H.; Lee, W.W.L. (Weston (Roy F.), Inc., Rockville, MD (USA)). Feb 1985. Contract AC05-84OR21400;AC01-83NE44301. 114p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85011807.

Performance assessment involves predicting the potential radiological impact of a nuclear waste disposal system, taking into account all of the natural and engineered components of the system. It includes the analysis and evaluation of predicted system and component performance to determine compliance with regulatory performance criteria. In the context of the nuclear waste management program, performance assessment has five major purposes: to assist in the evaluation and selection of repository sites; to guide the research, development, and testing programs; to assist in the evaluation of repository designs; to assist in the evaluation of the design and performance of engineered barriers; and to show regulatory compliance and support repository licensing. Current performance assessment methodologies are still in the developmental stage. Only the simplest of bounding calculations have produced quantitative predictions of radionuclide releases. The methodologies require considerable extension and validation before they can provide answers suitable for project decisions and licensing. 135 refs., 9 figs., 1 tab.

29918 (DOE/RW—0022) Need for and feasibility of monitored retrievable storage: a preliminary analysis. (USDOE Office of Civilian Radioactive Waste Management, Washington, DC). Apr 1985. 39p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85013153.

The Nuclear Waste Policy Act of 1982 directed the Department of Energy (DOE) to complete a study of the need for, and the fesibility of, monitored retrievable storage (MRS). This study will form part of the basis for the Secretary's recommendation to Congress with regard to an MRS facility. This paper is the DOE's initial analysis of this important topic. 8 figs., 2 tabs.

29919 (DOE/RW—0023) Screening and identification of sites for a proposed Monitored Retrievable Storage Facility. (USDOE Office of Civilian Radioactive Waste Management, Washington, DC). Apr 1985. 70p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85013154.

The Director, Office of Civilian Radioactive Waste Management (OCRWM), Department of Energy (DOE), has identified the Clinch River Breeder Reactor site, the DOE Oak Ridge Reservation and the Tennessee Valley Authority (TVA) Hartsville Nuclear Plant site as preferred and alternative sites, respectively, for development of site-specific designs as part of the proposal for construction of an integrated Monitored Retrievable Storage (MRS) Facility. The proposal, developed pursuant to Section 141 (b) of the Nuclear Waste Policy Act of 1982, will be submitted to Congress in January 1986. The Director expects to propose to Congress that an MRS be constructed at the perferred site. His judgment could change based on information to be developed between now and January 1986. The decision to construct an MRS facility and final site selection are reserved by Congress for itself. The Director's judgment is based on the results of a rigorous site screening and evaluation process described in this report. The three sites were selected from among eleven sites evaluated in detail. The Clinch River Breeder Reactor site, owned by the Tennessee Valley Authority, was identified as the preferred site. It has several particularly desirable features including: (1) federal ownership and control by the Department of Energy; (2) particularly good transportation access (five miles to the nearest interstate highway and direct rail access); (3) site characteristics and current data base judged by the NRC in 1983 as sufficient for granting a limited work authorization for the now cancelled breeder reactor; and (4) a technical community in the vicinity of site which can provide experienced nuclear facility support functions. 6 figs., 2 tabs.

29920 (DP-MS—84-140) I-129 analysis in radioactive waste. Ryan, J.P.; Winn, W.G. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 28 Apr 1985. Contract AC09-76SR00001. 15p. (CONF-850417—20). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012323.

From 189. national meeting of the American Chemical Society; Miami, FL, USA (28 Apr 1985).

A neutron activation method is described for the analysis of I-129 in defense waste salt solutions. 10 refs., 2 figs., 3 tabs.

29921 (DP-MS—84-141) Electrically fired incineration of combustible radioactive waste. Charlesworth, D.; Hill, M. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.; Shirco, Inc., Dallas, TX (USA)). 1985. Contract AC09-76SR00001. 9p. (CONF-850744—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85010067.

From National conference on environmental engineering; Boston, MA, USA (1 Jul 1985).

Du Pont Company and Shirco, Inc. are developing a process to incinerate plutonium-contaminated combustible waste in an electrically fired incineration system. Preliminary development was

BEST COPY AVAILABLE

FOR REPRODUCTION

completed at Shirco, Inc. prior to installing an incineration system at the Savannah River Laboratory (SRL), which is operated by Du Pont for the US Department of Energy (DOE). The waste consists of disposable protective clothing, cleaning materials, used filter elements, and miscellaneous materials exposed to plutonium contamination. Incinerator performance testing, using physically representative nonradioactive materials, was completed in March 1983 at Shirco's Pilot Test Facility in Dallas, TX. Based on the test results, equipment sizing and mechanical begin of a full-scale process were completed by June 1983. The full-scale unit is being installed at SRL to confirm the initial performance testing and is scheduled to begin in June 1985. Remote operation and maintenance of the system is required, since the system will eventually be installed in an isolated process cell. Initial operation of the process will use nonradioactive simulated waste. 2 figs., 2 tabs.

29922 (DP-MS—85-9) **Slag cement - low-level waste forms at the Savannah River Plant.** Malek, R.I.A.; Roy, D.M.; Barnes, M.W.; Langton, C.A. (Pennsylvania State Univ., University Park (USA). Materials Research Lab.; Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1985. Contract AC09-76SR00001. 41p. (CONF-850536—3). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012328.

From American Ceramic Society annual meeting; Cincinnati, OH, USA (5 May 1985).

A cement based waste form is being designed for disposal of Savannah River Plant low-level radioactive waste salt. The disposal process includes emplacing the saltstone in engineered trenches. The waste form (matrix) must exhibit reasonable physical/mechanical properties with minimal leaching of the contained waste salts (1). As part of a program carried out at PSU/MRL to optimize properties of the waste form (2), formulations containing low-calcium fly ash and granulated blast furnace slag with and without portland cement have been tested and the data compared with those of other mixes containing either low- or high-calcium fly ash and no slag. The results of physical/mechanical testing, leach tests, chemical characterization, and adiabatic heat of hydration are presented. Included is a review of the alkali-activated slag hydration process. 12 refs., 21 figs., 10 tabs.

29923 (DP-MS—85-11) **Use of Co-60 gamma irradiation to simulate decomposition of tetraphenylborate precipitates from high-level radioactive waste.** Gupta, A.K.; Hanrahan, R.J.; Walker, D.D.; Ebra, M.A. (Florida Univ., Gainesville (USA). Dept. of Chemistry; Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1985. Contract AC09-76SR00001. 24p. (CONF-850417—21). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012324.

From 189. national meeting of the American Chemical Society; Miami, FL, USA (28 Apr 1985).

Savannah River Plant nuclear waste requires the decontamination of approximately 100 million gallons of salt solution. The radioactive Cs-137 will be removed by precipitating it as a tetraphenylborate (TPB) salt. This radioactive precipitate will be stored in large, underground steel tanks for approximately two years until it is consigned to the Defense Waste Processing Facility (DWPF) for immobilization in glass. During the processing and storage, the tetraphenylborate precipitate will be subjected to intense beta and gamma irradiation which will cause partial decomposition leading to the production of many organic compounds. The purpose of this project was to qualitatively and quantitatively identify the organic products formed from the radiolysis of soluble and insoluble tetraphenylborate salts.

29924 (EGG-PBS—6851) **Technical evaluation of the NUS Process Services Corporation Radwaste Solidification System topical report.** Henscheid, J.W.; Young, T.E. (EG and G Idaho, Inc., Idaho Falls (USA)). 18 Apr 1985. Contract AC07-76ID01570. 11p. NTIS, PC A02/MF A01 - GPO. File Number TI85011678.

This report summarizes EG & G Idaho's review of the NUS Process Services Corporation topical report on a Radwaste Solidification System. The review evaluated compliance with pertinent codes, standards and regulations. The initial review was discussed with NUS, and all outstanding issues resolved before this final evaluation was made.

29925 (ERP/MSL—83-39, pp 1-31) **Evaluation of tailings stabilization methods.** Ritcey, G.M.; Skeaff, J.M. (Canada Centre for Mineral and Energy Technology, Ottawa, Ontario). Mar 1983. NTIS (US Sales Only), PC A11/MF A01. File Number DE85701198. (CONF-8205300—).

From Canadian Uranium Producers' Metallurgical committee meeting; Bancroft, Ontario, Canada (19 May 1982).

Four commercial waste solidification processes based on inorganic and asphaltic binders were applied to uranium (and leach) mill tailings. The solidified tailings were evaluated by measuring their physical and chemical properties immediately after solidification and as a function of time. The method based on an asphaltic binder was superior but was more expensive by an order of magnitude than a lime based method. Hence the lime based method was considered to be the best compromise, yielding relatively good properties at reasonable costs.

29926 (EUR—8669) **Directory of computer programs for assessment of radioactive waste disposal in geological formations.** Broyd, T.W.; Dean, R.B.; Hobbs, G.D.; Knowles, N.C.; Putney, J.M.; Wrigley, J. (Commission of the European Communities, Luxembourg). 1984. 536p. NTIS (US Sales Only), PC A23/MF A01. File Number DE85701517.

This Directory describes computer programs suitable for the assessment of radioactive waste disposal facilities in geological formations. The programs, which are mainly applicable to the post closure analysis of the repository, address combinations of the following topics: nuclide inventory, corrosion, leaching, geochemistry, stress analysis, heat transfer, groundwater flow and radionuclide transport. Biosphere modelling, surface water flow and risk analysis are not covered. A total of 248 programs are identified, of which 50 are reviewed in detail, 134 in summary and 64 in tabular fashion. The directory has been compiled using a combination of literature searches, telephone and postal correspondence and meetings with recognised experts in the respective areas of work covered. It differs from previous reviews of computer programs for similar topics areas in two main respects. Firstly, the method of obtaining information has resulted in program descriptions of considerable breadth and detail. Secondly, the Directory has concentrated wherever possible on European codes, whereas most previous work of this nature has looked solely at programs developed in North America. The reviews are presented in good faith, but it has not been possible to run any of the programs on a computer, and so truly objective comparisons may not be made. Finally, although the Directory is specific to the post-closure assessment of a repository site, some of the programs described could also be used in other areas of repository analysis (e.g., repository design).

29927 (EUR—9071) **Feasibility study for the final disposal in the Konrad mine based on experiments for radioactive waste isolation and handling.** (Commission of the European Communities, Luxembourg). 1984. 192p. (In German). NTIS (US Sales Only), PC A09/MF A01. File Number DE85701264.

The studies contained in this report prove both the suitability of the disused iron-ore mine Konrad for the final disposal of low level radioactive wastes and decommissioning waste from nuclear power stations and the safety of the disposal operations. Petrographical, geochemical, hydrogeological, hydrochemical, rock mechanical, seismic and radiological investigations are reported.

29928 (EUR—9106) **Long-term storage of ^{85}Kr in amorphous zeolite 5A.** Penzhorn, R.D.; Noppel, H.E.; Dorea, A.; Guenther, K.; Leitzig, H.; Schuster, P. (Commission of the European Communities, Luxembourg). 1984. 73p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701518.

Ar, Kr and Xe can be immobilized in type A zeolites as well as in mordenite and chabazite, when the original crystal structure is hydrothermally vitrified in the presence of the densified gas. Zeolites containing a high percentage of earth alcali metals yield encapsulates that are thermally very stable. Gas fixation conditions are essentially independent of the form of aggregation of the matrix. Noble gas encapsulates were characterized by their specific surface area as well as by microprobe analysis, X-ray analysis and electron diffraction. The results indicate that Kr is immobilized in units smaller than the size of a zeolite crystal. The thermal conductivity of zeolites was determined experimentally in various fluid media. With the data obtained the heat transport through a final storage vessel cooled by natural air convection was calculated. The estimated temperature profiles correlate well with those obtained in experiments simulating a storage containment. To verify the process, active samples having specific activities up to 30 mCi/g have been prepared. Leaching results demonstrate the chemical stability of the Kr/5A encapsulates. A semi-pilot facility based on the one-way autoclave concept has been constructed and demonstrated in operation.

29929 (GAT-S—33) **Biodegradation of uranium-contaminated waste oil.** Hary, L.F. (Goodyear Atomic Corp., Piketon, OH (USA)). 14 Mar 1983. Contract AC05-76OR00001. 39p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012804.

The Portsmouth Gaseous Diffusion Plant routinely generates quantities of uranium-contaminated waste oil. The current generation rate of waste oil is approximately 2000 gallons per year. The waste is presently biodegraded by landfarming on open field soil plots. However, due to the environmental concerns associated with this treatment process, studies were conducted to determine the optimum biodegradation conditions required for the destruction of this waste. Tests using respirometric flasks were conducted to determine the biodegradation rate for various types of Portsmouth waste oil. These tests were performed at three different loading rates, and on unfertilized and fertilized soil. Additional studies were conducted to evaluate the effectiveness of open field landfarming versus treatment at a greenhouse-like enclosure for the purpose of maintaining soil temperatures above ambient conditions. The respirometric tests concluded that the optimum waste oil loading rate is 10% weight of oil-carbon/weight of soil (30,600 gallons of uranium-contaminated waste oil/acre) on soils with adjusted carbon:nitrogen and carbon:phosphorus ratios of 60:1 and 800:1, respectively. Also, calculational results indicated that greenhouse technology does not provide a significant increase in biodegradation efficiency. Based on these study results, a 6300 ft.^{2} abandoned anaerobic digester sludge drying bed is being modified into a permanent waste oil biodegradation facility. The advantage of using this area is that uranium contamination will be contained by the bed's existing leachate collection system. This modified facility will be capable of handling approximately 4500 gallons of waste oil per year; accordingly current waste generation quantities will be satisfactorily treated. 15 refs., 14 figs., 4 tabs.

29930 (HEDL—7540) **Technical test description of activities to determine the potential for spent fuel oxidation in a tuff repository.** Einziger, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1985. Contract AC06-76FF02170. 57p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85013265.

The potential change in the oxidation state of spent fuel during its residence in a repository must be known to evaluate its radionuclide retention capabilities. Once the container breaches, the spent fuel in a repository sited above the water table will be exposed to a moist air atmosphere at low temperatures. Thermodynamically, there is no reason why the fuel should not oxidize to a higher oxidation state under these conditions, given enough time. Depending on the rate of oxidation, higher oxides with potentially higher leach rates may eventually form or the cladding may even split open. If either of these oxidation effects occurs, the ability of spent fuel to retard radionuclide migration will be reduced. A technical test description is presented to study spent fuel oxidation at low temperatures characteristic of the post-container breach period and at high temperatures in a moist inert atmosphere characteristic of a sealed container with waterlogged fuel, early in the repository life. The approach taken will be to perform tests and evaluations to gain understanding of the operative oxidation mechanisms, to obtain oxidation rate data, and to make projections of potential long-term fuel oxidation states. Time and temperature dependence of existing models will be evaluated, and the dependence of the model projections on fuel variables will be determined. 27 refs., 7 figs., 4 tabs.

29931 (IA—1404, pp 156) **Purification of low-level radioactive effluents by membrane-based processes.** Boger, Z.; Cikurel, H.; Trigerman, S.; Hodara, I. Jul 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85780940.

Published in summary form only.

In Research laboratories annual report 1983.

29932 (IAEA-TECDOC—319) **Effects of heat from high-level waste on performance of deep geological repository components. Report of a technical committee meeting on effects of heat from radioactive waste in deep geological repositories organized by the IAEA and held in Stockholm, 28 August-2 September 1983.** (International Atomic Energy Agency, Vienna (Austria)). Nov 1984. 81p. NTIS (US Sales Only), PC A05/MF A01. File Number DE85701046.

This report discusses the effects of heat on the deep geological repository systems and its different components. The report is focussed specifically on effects due to thermal energy release solely from high-level waste or spent fuel. It reviews the experimental data and theoretical models of the effects of heat both on the behaviour of engineered and natural barriers. A summary of the current status of research and repository development including underground test facilities is presented.

29933 (INFO—0070) **Qualitative evaluation of long-term processes governing the behaviour of uranium mill tailings placed in deep lakes.** (Beak Consultants Ltd., Toronto, Ontario (Canada); Atomic Energy Control Board, Ottawa, Ontario (Canada)). Mar 1982. 42p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701225.

French version included. Study conducted for the Atomic Energy Control Board.

The emplacement of uranium mill tailings in deep lakes may provide an acceptable method of tailings disposal at certain sites in Canada. Disposal in a depositional environment typical of deep lakes appears to offer greater prospects for long-term stability than present methods of land-based management. From the regulatory point of view, it is necessary to know which factors should be taken into account in assessing the acceptability of such an approach. This report examines the environmental variables governing the behaviour of radionuclides and trace elements in the groundwater systems, lake water, and finally in the biosphere over the short and long term. Physical, chemical and biological factors are each considered. Conclusions are presented in terms of points for and against disposal in deep lakes. This report summarizes the data and conclusions presented in an annex volume.

29934 (INFO—0070-App.) **Qualitative evaluation of long-term processes governing the behaviour of uranium mill tailings placed in deep lakes. Annexes.** McKee, P.; Snodgrass, W.; Lush, D.L.; Ross, P. (Atomic Energy Control Board, Ottawa, Ontario (Canada)). Mar 1982. 305p. NTIS (US Sales Only), PC A14/MF A01. File Number DE85701226.

29935 (INS-R—312) **Requirements of the London Convention for dumping radioactive waste at sea.** Sutton, H.C. (Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Inst. of Nuclear Sciences). Oct 1982. 73p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701520.

This report outlines the requirements of the London Convention for dumping radioactive waste at sea and considers their scientific basis more fully. It is intended primarily as an appraisal and aid to understanding of the two documents IAEA 210 and IAEA 211, published by the International Atomic Energy Agency, and relating to the oceanographic and radiobiological basis of their definitions of high level waste and recommendations relating to its dumping at sea, which were required for London Convention purposes. The adequacy and conservation in these recommendations are considered, and the report also compares the predictions of the model on which the recommendations are based with some limited but relevant observations on radiation doses resulting from natural causes (radium in the sea), and from fallout from nuclear bomb tests. It is concluded that if dumping is carried out within the limits and according to the recommendations required by the IAEA, then it is extremely unlikely that this could lead to significant human hazard, either now or in the future. Some of the reasons for this conclusion are summarised in the final chapter.

29936 (JAERI-M—84-043) Recovery of neptunium. Literature survey. Morita, Yasuji; Kubota, Masumitsu. (Japan Atomic Energy Research Inst., Tokyo). Mar 1984. 32p. (In Japanese). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701029.

Contains 62 refs. .

The literature survey was carried out on the behavior and the recovery of Neptunium-237 which had become one of the most significant isotopes from a viewpoint of the safety management of the high-level waste. The present report consists of three parts; in the first part neptunium behavior in Purex process is described, in the second the methods to recover Np in Purex process by a small modification and in the third neptunium recovery from the high-level waste. It became clear that in Purex process the oxidation of Np catalyzed by nitrite played an important role at the co-extraction stage. At the following stages neptunium behavior is influenced by a characteristic of plutonium reductant, acidity in aqueous phase and the uranium concentration in organic phase. Neptunium recovery from the high-level waste needs an adjustment of neptunium valence, generally a reduction to Np (IV). It seems a key point to control a valence for the separation and the recovery. Studies on neptunium recovery are expected taking into account of controlling neptunium valence with a salt-free process and improving a recovery rather than a purity of Np. This report will contribute to the development of partitioning process including neptunium recovery.

29937 (Juel—1953) Distillation as a means of separating krypton from the off-gas of a reprocessing plant for graphite-coated HTR fuel elements. Juergens, B. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemische Technologie der Nuklearen Entsorgung). Oct 1984. 145p. (In German). NTIS (US Sales Only), PC A07/MF A01. File Number DE85751651.

The AKUT-II facility is described, which is designed for an off-gas throughput of 10 Nm³/h. The low-pressure section is for primary purification in several steps, whereas in the high-pressure CO_2 section (70 bar, 20°C) the separation of Kr-85 by means of distillation is achieved. The parameters for the design of the rectifying columns have been determined experimentally.

29938 (KBS-TR—121) KBS Technical report 1-120 (1977-1978). Summaries. (Kaernbraenslesaekerhet, Stockholm (Sweden)). May 1979. 318p. NTIS (US Sales Only), PC A14/MF A01. File Number DE85701265.

The Swedish nuclear utilities started early in 1977 the KBS (nuclear fuel safety) project to study the high level waste problem and report on how and where a safe final storage could be arranged in Sweden. The docummentation produced by the project during 1977 and 1978 has been collected in a series of technical reports numbered from 1 to 120. The English summaries of the technical reports have been collected in this separate volume, No. 121.

29939 (KFK—3825) Optimization of activity loading of low and medium level waste packages. Hauser, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik). Jan 1985. 53p. (In German). NTIS (US Sales Only), PC A04/MF A01. File Number DE85751646.

The described BASIC program packet PROMAX, consisting of 15 independent single programs, each one applicable to one type of waste package, calculates the maximum specific activity (output) of the final waste form for the specified dose rate limits with the nuclide names and activity portions (waste specific composition of activity) used as the input. The calculations are based on the packages for low and medium level wastes used at the Karlsruhe Nuclear Research Center, e.g., non-shielded 200/400 l drums, sheet steel containers, single concrete shieldings for 200/400 l drums, concrete containers and a cast steel container. Based on the calculations the most appropriate package can be selected for a waste to be conditioned and, if applicable, a specification be given for concentrating or mixing various waste types. This report describes the method of calculation and demonstrates the application of the program packet on the example of conditioning various LLW/MLW waste solutions. In addition, the containers described are discussed with a view to their shielding properties.

29940 (NPC(W)R—764) Fully engineered shallow trench design concepts for disposal of low and intermediate level radioactive waste. Interim report. Locke, J. (National Nuclear Corp. Ltd., Whetstone (UK)). Sep 1984. 33p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701266.

In this report, the results of the reviews of design concepts, waste arisings and release mechanisms are described. The basic principles of radiological protection and the proposed strategy for land disposal in the UK are outlined. The essential features of engineered trenches are described with some discussion of the likely material choices and their influence on nuclide release. The radiological protection criteria adopted in this study is that the overall risk of serious health effects arising from any release of radioactivity from a shallow engineered trench should always be less than 10^{-6} per annum, which corresponds to a received dose of 0.1 mSv/yr. This approach to radiological protection takes account of the two components of risk of health detriment to future generations; namely the probability that a release of radionuclides will occur and the probability that the subsequent radiation doses will give rise to deleterious effects. A compilation is presented of the waste streams and expected volumes and activities that may be designated for LAND 2 disposal and an initial estimate of the associated nuclide inventory is given.

29941 (NUREG/CP—0062, pp 29-30) **Thermodynamic problems in speciation modeling.** Barnes, H.L. (Pennsylvania State Univ., University Park). Apr 1985. NTIS, PC A06/MF A01 - GPO. File Number TI85009817. (CONF-8410234—Summs.; ORNL/TM—9585).

From Application of geochemical models to high-level nuclear waste repository assessment; Oak Ridge, TN, USA (2 Oct 1984).

The principal goal of geochemical modeling is to provide a rigorous evaluation of mass transport in nuclear waste repositories. Numerical models, in principle and if carefully constructed, should provide the most accurate basis for understanding in advance the behavior of a repository. Numerical modeling depends upon both kinetic and thermodynamic methods for realistic evaluation of mass flow rates. The purpose of this paper is to emphasize some thermodynamic methods that have not yet been exploited or that need further development to achieve the necessary resolution.

29942 (NUREG/CP—0062, pp 31-36) **Prediction of mineral solubilities and diagenesis in rock/water association at high temperature.** Moeller, N.; Weare, J.H.; Greenberg, J. (Univ. of California, San Diego). Apr 1985. NTIS, PC A06/MF A01 - GPO. File Number TI85009817. (CONF-8410234—Summs.; ORNL/TM—9585).

From Application of geochemical models to high-level nuclear waste repository assessment; Oak Ridge, TN, USA (2 Oct 1984).

To make qualitatively correct predictions of the solubility of minerals in natural brines above $I \sim .1m$, it is necessary to use thermodynamic models of high accuracy (5% in the log of the activity coefficients). This requirement results from the fact that in complex systems small errors in the calculated solution phase free energy often drastically change the predicted equilibrium solid phase assemblage. An example of the need for high accuracy is shown in the successful modeling of the complex changes which occur in the seawater equilibrium mineral assemblage during evaporation. Accurate chemical models are also required for reliable application to nuclear waste management programs. Examples of uses of such models in these programs are given.

29943 (NUREG/CP—0062, pp 69-71) **Complexes of actinides with naturally occurring compounds.** Choppin, G.R. (Florida State Univ., Tallahassee). Apr 1985. NTIS, PC A06/MF A01 - GPO. File Number TI85009817. (CONF-8410234—Summs.; ORNL/TM—9585).

From Application of geochemical models to high-level nuclear waste repository assessment; Oak Ridge, TN, USA (2 Oct 1984).

Among the variables of major influence on the chemical behavior of actinides in natural systems are redox potential, pH, complexation by inorganic ligands (particularly carbonate and hydroxide), complexation and/or reduction by organic ligands, sorption to solids and residence time. The effects of complexation and/or redox reactions with organic compounds may be very important and are examined in this paper.

29944 (NUREG/CP—0062, pp 72-73) **Determination of stability constants of the carbonate complexes of uranium and neptunium.** Maya, L. (Oak Ridge National Lab., TN). Apr 1985. NTIS, PC A06/MF A01 - GPO. File Number TI85009817. (CONF-8410234—Summs.; ORNL/TM—9585). Contract AC05-84OR21400.

From Application of geochemical models to high-level nuclear waste repository assessment; Oak Ridge, TN, USA (2 Oct 1984).

This contribution attempts to convey the difficulties and limitations encountered in obtaining stability constants of complex ions in solution. This information is of importance in developing mathematical models describing the migration of a given element in the geosphere. The difficulties in obtaining speciation schemes and therefore reliable models of migration are particularly accentuated in dealing with the actinide elements. The aqueous chemistry of these elements, under conditions similar to those found in groundwaters, is subject to a series of competing reactions, aside of adsorption phenomena which is a complex subject on its own right. The actinides undergo redox reactions, hydrolysis and complexation; mainly by carbonate, sulfate, phosphate and fluoride. Under certain circumstances, the solubilities of some of these species are exceeded and solid phases precipitate. Speciation schemes for the actinides are difficult to obtain because of the multiplicity of species that might be present at any given pH and ligand concentration. Thus an accurate representation requires consideration of all possible species and reliable stability constants for each one.

29945 (NUREG/CP—0062, pp 74-80) **Temperature dependence of actinide solubilities and speciation.** Silva, R.J. (Lawrence Berkeley Lab., CA). Apr 1985. NTIS, PC A06/MF A01 - GPO. File Number TI85009817. (CONF-8410234—Summs.; ORNL/TM—9585).

From Application of geochemical models to high-level nuclear waste repository assessment; Oak Ridge, TN, USA (2 Oct 1984).

Most of the available thermodynamic data on the nature and solubilities of compounds, as well as solution species, of the actinides U, Np, Pu and Am come from measurements made at or near 25°C. Elevated temperatures are, however, expected in a nuclear waste repository. Since oxidation state distributions, solubility product constants and formation constants for solution complexes are in general a function of temperature, one would expect the solubilities, and perhaps even the nature of stable compounds and solution species, of the actinides to change with increasing temperature in a complex way. Unfortunately, not nearly enough thermodynamic data are available at temperatures above 25°C to accurately predict solubilities as a function of temperature. However, using available data and estimates of the temperature dependence of reaction constants, one can perform equilibrium calculations that may provide information on the trends in solubilities and speciation and delineate the important parameters. This was done for U, Np, Pu and Am.

29946 (NUREG/CP—0062, pp 104-108) **Applications of geochemical modeling to high-level nuclear waste disposal at the Hanford site, Washington.** Early, T.O.; Myers, J.; Jenne, E.A. (Rockwell Hanford Operations, Richland, WA). Apr 1985. NTIS, PC A06/MF A01 - GPO. File Number TI85009817. (CONF-8410234—Summs.; ORNL/TM—9585).

From Application of geochemical models to high-level nuclear waste repository assessment; Oak Ridge, TN, USA (2 Oct 1984).

The current and projected uses of geochemical models by the Basalt Waste Isolation Project (BWIP) focus on two segments of the repository system and their associated long-term goals. These segments are the waste package and far-field environments. The long-term goals relative to the waste package environment are to: understand important solid/water reactions which control the waste package environment (Eh, pH, groundwater composition) during the thermal period; and to understand the controls on steady-state solution concentrations of key radionuclides to provide a source term for waste package radionuclide release modeling. The long-term goals relative to the far-field environment are to: understand important geochemical controls on dissolved constituents of the preemplacement groundwater flow system; provide geochemical support for conceptual groundwater flow models; and to obtain bounding information relative to the geochemical fate of radionuclides along likely flow paths to the accessible environment. Geochemical modeling applications in both areas are discussed.

From Application of geochemical models to high-level nuclear waste repository assessment; Oak Ridge, TN, USA (2 Oct 1984).

The Nevada Nuclear Waste Storage Investigations (NNWSI) project is evaluating the tuffaceous rock units at Yucca Mountain, located on the western boundary of the Nevada Test Site, as a potential location for a high level radioactive waste repository. Within the NNWSI project, Lawrence Livermore National Laboratory (LLNL) has been assigned responsibility for the design and qualification of the waste package. This task includes the determination of the waste package environment, the characterization of waste package-repository material interactions and the analysis and testing of the waste package performance in the repository environment. This paper describes an ongoing analysis of experimental work to determine the matrix diffusion coefficient for the NNWSI waste package environment.

29948 (NUREG/CP—0062, pp 111-112) **Applications of geochemical modeling to site characterization and radionuclide transport in the NNWSI project.** Kerrisk, J.F. (Los Alamos National Lab., NM). Apr 1985. NTIS, PC A06/MF A01 - GPO. File Number TI85009817. (CONF-8410234—Summs.; ORNL/TM—9585).

From Application of geochemical models to high-level nuclear waste repository assessment; Oak Ridge, TN, USA (2 Oct 1984).

The Nevada Nuclear Waste Storage Investigations project (NNWSI) is studying a site at Yucca Mountain, in southern Nevada, as a possible nuclear waste repository. Los Alamos National Laboratory is responsible for the geochemical aspects of site characterization at Yucca Mountain. Geochemical models are being used in site characterization to help understand (a) local water chemistry, (b) local mineralogy, (c) the relation between water chemistry and mineralogy, and (d) the effects of water chemistry and mineralogy on waste-element solubility and transport.

29949 (NUREG/CP—0062, pp 113-114) **Chemical modeling of nuclear waste repositories in the salt repository project.** Jansen, G.; Raines, G.E.; Kircher, J.F.; Hubbard, N. (Battelle Memorial Institute, Columbus, OH). Apr 1985. NTIS, PC A06/MF A01 - GPO. File Number TI85009817. (CONF-8410234—Summs.; ORNL/TM—9585).

From Application of geochemical models to high-level nuclear waste repository assessment; Oak Ridge, TN, USA (2 Oct 1984).

Salt deposits contain small amounts of water as brine in fluid inclusions in halite and in hydrous minerals, e.g., clays, kieserite ($MgSO_4 . H_2O$) and carnallite ($KMgCl_3 . 6H_2O$). For the candidate salt deposits, the total amounts of water as volume % brine are: Palo Duro Basin, Texas, approximately 1.8; Paradox Basin, Utah, approximately 5.0 for the carnallite-marker zone, and less than approximately 0.5 below this zone; Gulf Coast salt domes, less than 0.15. For the Palo Duro and Paradox salt, the brines are Mg-rich (approximately 20,000 mg/L to approximately 100,000 mg/L) and sometimes Ca-rich (up to about 20,000 mg/L) NaCl brines. Brine migration calculations have been made using calculations of the time-variant thermal gradient around the waste packages and conservatively high brine volumes in the salt (5.0 volume % for the Texas and Utah sites and 0.5 volume % for the Gulf Coast) as input data. The maximum amounts of brine that eventually migrate to each waste package are about $1.0 m^3$ (for 5.0 volume % brine) and $0.2 m^3$ (for 0.5 volume % brine). With current conceptual designs for waste package overpacks (10 to 15 cm thick low-carbon steel), the waste package is not breached by uniform corrosion within 10,000 years. In brines this material thus far shows only uniform corrosion. For the expected conditions, where the brine is provided solely by brine migration, the brine is consumed by reaction with the iron of the overpack nearly as fast as it migrates to the waste package. Therefore, for the expected conditions, data about corrosion rates, radiolysis, etc., are not important. However, it is essential that accurate volumes of in-migrating brine can be calculated.

29950 (NUREG/CR—3747) Selection and testing of rock for armoring uranium tailings impoundments. Foley, M.G.; Kimball, C.S.; Myers, D.A.; Doesburg, J.M. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 115p. (PNL—5064). NTIS, PC A06/MF A01 - GPO. File Number TI85013799.

Pacific Northwest Laboratory has developed an approach for selecting and testing rock for its suitability and durability as armor for protecting decommissioned uranium mill tailings piles. A preliminary survey of the literature determined that existing techniques for testing rock durability were inadequate for evaluating long-term (~100 years) applications. Suites of rock samples with common lithologies and documented durations of exposure to weathering were then collected and submitted to three-axis ultrasonic testing in an attempt to develop a more reliable testing technique. We found little correlation between the duration of weathering and ultrasound velocity or attenuation in the rock. Through further study, we determined that the best screening approach incorporates common geomorphologic field collection techniques and laboratory tests. Suites of samples with known durations of exposure to weathering can be subjected to wet abrasion and wetting-drying tests to screen local rock types and select those with the greatest potential durability. Furthermore, the expected decrease of rock mass with environmental stresses (e.g., flood impingement and diurnal wetting-drying cycles) can be estimated using this approach. Further work was beyond the scope of this study. However, we are confident that this approach can determine the suitability for long-term armor of the most durable candidates using careful field sampling (including relative and absolute age-dating) and re-applying the laboratory tests. This approach, with supporting hydrologic analyses, should yield an expression of expected mass decrease as a function of time for the samples. 25 figs., 6 tabs.

29951 (NUREG/CR—3906) Uranium mill tailings neutralization: contaminant complexation and tailings leaching studies. Opitz, B.E.; Dodson, M.E.; Serne, R.J. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 73p. (PNL—5179). NTIS, PC A04/MF A01 - GPO. File Number TI85013271.

Laboratory experiments were performed to compare the effectiveness of limestone ($CaCO_3$) and hydrated lime [$Ca(OH)_2$] for improving waste water quality through the neutralization of acidic uranium mill tailings liquor. The experiments were designed to also assess the effects of three proposed mechanisms - carbonate complexation, elevated pH, and colloidal particle adsorption - on the solubility of toxic contaminants found in a typical uranium mill waste solution. Of special interest were the effects each of these possible mechanisms had on the solution concentrations of trace metals such as Cd, Co, Mo, Zn, and U after neutralization. Results indicated that the neutralization of acidic tailings to a pH of 7.3 using hydrated lime provided the highest overall waste water quality. Both the presence of a carbonate source or elevating solution pH beyond pH = 7.3 resulted in a lowering of previously achieved water quality, while adsorption of contaminants onto colloidal particles was not found to affect the solution concentration of any constituent investigated. 24 refs., 8 figs., 19 tabs.

29952 (NUREG/CR—4134) Repository environmental parameters relevant to assessing the performance of high-level waste packages. Claiborne, H.C.; Croff, A.G.; Griess, J.C.; Smith, F.J. (Oak Ridge National Lab., TN (USA)). Feb 1985. Contract AC05-84OR21400. 123p. (ORNL/TM—9522). NTIS, PC A06/MF A01 - GPO. File Number TI85006789.

This document provides specifications for a model/methodology and approach that could be employed in determining postclosure repository environmental parameters relevant to high-level waste package performance for the Basalt Waste Isolation Project (BWIP). Guidance is provided on (1) the identity of the relevant repository environmental parameters (groundwater characteristics, temperature, radiation, and pressure), (2) the models/methodologies employed to determine the parameters, and (3) the input data base for the model/methodologies. Supporting studies included are (1) an analysis of potential waste package failure modes leading to identification of the relevant repository environmental parameters, (2) an evaluation of the credible range of the repository environmental parameters for the BWIP situation, and (3) a summary review of existing models/methodologies currently employed in determining repository environmental parameters relevant to waste package performance. 7 refs.

29953 (NUREG/CR—4161-Vol.1) Critical parameters for a high-level waste repository. Volume 1. Basalt. Binnall, E.P.; Wollenberg, H.A.; Benson, S.M.; Tsao, L.; Weres, O.; Ramirez, A.L.; Armantrout, G.A. (Lawrence Berkeley Lab., CA (USA); Lawrence Livermore National Lab., CA (USA)). May 1985. Contract W-7405-ENG-48. 93p. (UCID—20092-Vol.1). NTIS, PC A05/MF A01 - GPO. File Number TI85012798.

This report addresses critical parameters specific to a repository in basalt, using the Columbia River Basalt Group as the principal example. For the purposes of this report, a parameter is considered to be a physical property whose value helps determine the characteristics or behavior of a repository system. Parameters which are defined as critical are those essential to evaluate and/or monitor leakage of radionuclides from the repository and to evaluate the need for retrieval. The parameters are considered with respect to the disciplines of geomechanics, geology, hydrology, and geochemistry and are rank ordered in terms of importance. The specific role of each parameter, specific factors affecting the measurement of each parameter, and the interrelationships between the parameters are considered in detail. 38 refs., 1 fig., 11 tabs.

29954 (NUREG/CR—4192) Analysis of drainage and consolidation at typical uranium mill tailings sites. Fayer, M.J.; Conbere, W. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 51p. (PNL—5421). NTIS, PC A04/MF A01 - GPO. File Number TI85013274.

The computer code TRUNC was used to analyze three aspects of uranium mill tailings dewatering: the coupling of consolidation and fluid flow, drainage design, and cover load. One-dimensional simulations of the effects of consolidation on fluid flow within a tailings pile of either slimes or a sand/slimes mix showed that drainage flux was greater for a consolidating system early in the simulation. However, after days 1400 and 160 of the simulations for the slimes and sand/slimes mix, respectively, the fluxes from the nonconsolidating systems were greater. In the sand/slimes mix, the nonconsolidating system had a cumulative flux by day 5000 that was 93% of that of the consolidating system. At the same time, in the slimes tailings piles the nonconsolidating system had a cumulative flux of only 34% of that of the consolidating system. This dif-

FOR REPRODUCTION

ference indicates that consolidation and fluid flow should not be decoupled for the slimes. Two-dimensional simulations of an actual tailings pile drainage design showed that a sand blanket drain increased the rate of drainage and settlement. The sand blanket drain also significantly reduced differential settlement across the pile. This indicates that the use of a sand blanket drain could enable earlier placement of the cover system after tailings emplacement. In simulations of covered and uncovered tailings piles, nearly the same quantity of water was removed from each, but drainage occurred much more slowly without the cover; hence, surface settlement was slower when the tailings pile was not covered. 10 refs., 19 figs., 2 tabs.

29955 (NUREG/CR—4194) **Low-level nuclear waste shallow land burial trench isolation. Final report, October 1981-September 1984.** McCray, J.G.; Nowatzki, E.A.; Stetzenbach, K.J.; Armstrong, G. (Arizona Univ., Tucson (USA). Dept. of Nuclear and Energy Engineering). May 1985. 216p. NTIS, PC A10/MF A01 - GPO. File Number TI85901546.

This is the final report on a three year study to evaluate trench cap designs, trench construction and trench loading by accelerating the creation of void space to simulate waste degradation in order to apply stress conditions on the trench in a relatively short period of time. Eight trenches were initially constructed and instrumented, four in a semi-arid region and four in a more humid mountainous region. The concepts being tested were the "soil arch" and the "soil slab" in trench cap designs. After the first year the semi-arid site was abandoned due to cap failures. The humid site was continued to be monitored. A new trench incorporating an improved soil slab design with a wick was constructed at the location of the only failed trench at that time, at the humid site. As the result of these experiments the following conclusions have been reached: (1) Controlled compaction of backfill soils to ASTM D698 standards is not sufficient to mitigate surface subsidence in the long term. (2) Single sheet geotextile reinforcement is not adequate reinforcement for a trench cap in the shallow land burial mode. (3) A geotextile wrapped soil slab will attenuate the movement of surface subsidence and reduce surface water infiltration. (4) A steel-reinforced soil-cement slab has maintained its stability and appears to meet the requirements necessary for long term stability. (5) If the crown and cap remain stable so does the trench. Movement of water through the trench sidewalls is small and doesn't pond. (6) Aliphatic tracers performed well and dye type of tracers poorly in field use. (7) In general, tracers are feasible and effective as a trench monitoring tool. (8) Narrow designed trenches provide for improved trench cap stability. This report recommends a design for an enhanced isolation disposal trench providing improved monitoring capabilities.

29956 (NUREG/CR—4201) **Thermal stability testing of low-level waste forms.** Piciulo, P.L.; Chan, S.F. (Brookhaven National Lab., Upton, NY (USA)). May 1985. Contract AC02-76CH00016. 43p. (BNL-NUREG—51869). NTIS, PC A03/MF A01 - GPO. File Number TI85012086.

The NRC Technical Position (TP) on Waste Form specifies that waste forms should be resistant to thermal degradation. The thermal cycle testing procedure outlined in the TP on Waste Form was carried out and is believed adequate for demonstrating the thermal stability of solidified waste forms. The inclusion of control samples and the monitoring of sample temperature are recommended additions to the test. An outline for reporting thermal cycling test results is given. To produce a data base on the applicability of the thermal cycling test, the following simulated laboratory-scale waste forms were prepared and tested: boric acid and sodium sulfate evaporator bottoms, mixed bed bead resins, and powdered resins each solidified in asphalt, cement and vinyl ester-styrene. Thermal cycling does not significantly affect the compressive strength of the solidified wastes, except powdered resins solidified in cement which disintegrated during the test and bead resins in cement which showed a loss of compressive strength. After temperature cycling, cement solidified bead resins showed areas of spalling and solidified sodium sulfate forms had surface deterioration. Asphalt solidified wastes, except powdered resins, deformed by slumping on temperature cycling. Free liquid was released from vinyl esterstyrene solidifed waste forms as a result of thermal cycling. Dewatered bead and powdered resins were also tested and no free liquid was released on temperature cycling. 11 refs., 12 figs., 4 tabs.

29957 (NUREG/CR—4215) **Technical factors affecting low-level waste form acceptance criteria.** MacKenzie, D.R.; Vaslow, F.; Dougherty, D.R.; Chan, S.F. (Brookhaven National Lab., Upton, NY (USA)). May 1985. Contract AC02-76CH00016. 70p. (BNL-NUREG—51873). NTIS, PC A04/MF A01 - GPO. File Number TI85012785.

This report provides technical support to NRC in connection with the regulation 10 CFR Part 61 and NRC's Technical Position (TP) on waste form. Six specific areas are addressed, namely: the technical basis for limiting containers of radioactive gases to atmospheric pressure and 100 curies; the requirements to demonstrate that a stable waste would be recognizable for 300 or 500 years; the feasibility of achieving less than 5% deformation in buried wastes; the adequacy of ASTM tests G21 and G22 for testing for biodegradability; the adequacy of ASTM test B553 for testing for thermal degradation; and the basis for determining if a waste is explosive or pyrophoric. The principal conclusions of the report follow. A maximum pressure of 1.5 atmospheres for radioactive gases is acceptable, but the radioactivity limit should depend on the isotope, the quality of the container and the properties of the site. Site and package qualities and a wet/dry cycling test are suggested that appreciably increase the probability of indicating whether a waste would have long-term recognizability. Achieving deformation of buried waste of <5% would not be feasible using current solidification methods with either metal or polyethylene containers. ASTM tests G21 and G22, with modifications, are suitable for biodegradability testing. A modified form of ASTM B553 is adequate for thermal testing. Required information on pyrophoric and explosive materials is provided by tests given in Department of Transportation regulation 49 CFR Parts 172 and 173. 78 refs., 2 tabs.

29958 (OEFZS—4305) **Leach tests of cemented radioactive ion-exchange resins.** Patek, P. (Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H.). Dec 1984. 51p. (In German). (AV—15/84). NTIS (US Sales Only), PC A04/MF A01. File Number DE85701513.

According to the results of prior investigations, radioactive ion-exchange resins (powdered resins and bead resins) became cemented, using different recipes. In accordance with results of other investigators, referred to in the literature, it was found, that cesium is leached 250-850 tims better from the cement matrix than cobalt. Silver and cerium is retained additionally 10 times better than cobalt, so that the detection level of the gamma-multichannel spectrometer used for the evaluation, was met soon. For comparison radioactive ion-exchange resins themselves were eluted with several liquids, to study the behaviour of the pure resins during leaching conditions. Finally the compressive strength of the leached samples was determined.

29959 (ONWI—471) **Socioeconomic Data Base Report for the Paradox Basin, Utah. Letters and verification forms for personal communication data.** (Bechtel National, Inc., San Francisco, CA (USA)). May 1985. Contract AC02-83CH10140. 97p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85012385.

The letters printed in this document are references for data that appear in the study, Socioeconomic Data Base Report for the Paradox Basin, Utah (ONWI-471). The letters contain socioeconomic information and the signatures of individuals who provided specific data. This method of documentation was used to verify information that was not published in a referencible source. The following letters correspond to references that appear in the report.

29960 (PER—81, pp 40) **Review of current investigations, problems and future work with regard to radioactive waste disposal.** Hambleton-Jones, B.B. (Nuclear Development Corp. of South Africa (Pty.) Ltd., Pelindaba, Pretoria). Jan 1984. NTIS (US Sales Only), PC A04/MF A01. File Number DE85780942. (CONF-8311245—Absts.).

Published in summary form only.

29961 **(PNL—4980-Vol.1) Guidelines for selecting codes for ground-water transport modeling of low-level waste burial sites. Volume 1. Guideline approach.** Simmons, C.S.; Cole, C.R. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 197p. NTIS, PC A09/MF A01; GPO Dep. File Number DE85013471.

This document was written for the National Low-Level Waste Management Program to provide guidance for managers and site operators who need to select ground-water transport codes for assessing shallow-land burial site performance. The guidance given in this report also serves the needs of applications-oriented users who work under the direction of a manager or site operator. The guidelines are published in two volumes designed to support the needs of users having different technical backgrounds. An executive summary, published separately, gives managers and site operators an overview of the main guideline report. This volume includes specific recommendations for decision-making managers and site operators on how to use these guidelines. The more detailed discussions about the code selection approach are provided. 242 refs., 6 figs.

29962 **(PNL—5414) Nuclear Waste Treatment Program. Annual report for FY 1984.** Burkholder, H.C.; Rusin, J.M. (comps.). (Pacific Northwest Labs., Richland, WA (USA)). Apr 1985. Contract AC06-76RL01830. 133p. NTIS, PC A07/MF A01; GPO Dep. File Number DE85013581.

Two of the US Department of Energy's (DOE) nuclear waste management-related goals are: (1) to ensure that waste management is not an obstacle to the further deployment of light-water reactors (LWR) and nuclear fuel cycle closure and (2) to fulfill its institutional responsibility for providing safe storage and disposal of existing and future nuclear wastes. As part of its approach to achieving those goals, the Office of Terminal Waste Disposal and Remedial Action of DOE established what is now called the Nuclear Waste Treatment Program (NWTP) at the Pacific Northwest Laboratory (PNL) during the second half of FY 1982. To support DOE's attainment of its goals, the NWTP has two objectives: (1) to provide documented technology necessary for the design and operation of nuclear waste treatment facilities by commercial enterprises as part of a licensed waste management system and (2) to provide problem-specific treatment approaches, waste form and treatment process adaptations, equipment designs, and trouble-shooting assistance, as required, to treat existing wastes. This annual report describes progress during FY 1984 toward meeting the two objectives. 31 figs., 4 tabs.

29963 **(PNL—5486) Hanford ground-water data base management guide and user's manual.** Mitchell, P.J.; Argo, R.S.; Bradymire, S.L.; Newbill, C.A. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 87p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85013279.

This management guide and user's manual is a working document for the computerized Hanford Ground-water Data Base maintained by the Geosciences Research and Engineering Department at Pacific Northwest Laboratory for the Hanford Ground-Water Surveillance Program. The program is managed by the Occupational and Environmental Protection Department for the US Department of Energy. The data base is maintained to provide rapid access to data that are rountinely collected from ground-water monitoring wells at the Hanford site. The data include water levels, sample analyses, geologic descriptions and well construction information of over 3000 existing or destroyed wells. These data are used to monitor water quality and for the evaluation of ground-water flow and pollutant transport problems. The management guide gives instructions for maintenance of the data base on the Digital Equipment Corporation PDP 11/70 Computer using the CIRMIS (Comprehensive Information Retrieval and Model Input Sequence) data base management software developed at Pacific Northwest Laboratory. Maintenance activities include inserting, modifying and deleting data, making back-up copies of the data base, and generating tables for annual monitoring reports. The user's guide includes instructions for running programs to retrieve the data in the form of listings of graphical plots. 3 refs.

29964 **(PNL-SA—12565) Operational and long-term performance assessment for Hanford Grout.** Treat, R.L.; Lokken, R.O.; Stein, S.L.; Geffen, C.A. (Pacific Northwest Labs., Richland, WA (USA)). Feb 1985. Contract AC06-76RL01830. 5p. (CONF-850314—49). NTIS, PC A02/MF A01; GPO Dep. File Number DE85010057.

From Waste management '85; Tucson, AZ, USA (24 Mar 1985).

The Department of Energy and Rockwell Hanford Operations are preparing for the construction of a Transportable Grout Facility to immobilize selected radioactive liquid wastes now stored at Hanford. Oak Ridge National Laboratory is supporting the program by developing initial grout formulations for the facility. Pacific Northwest Laboratory is verifying the required operational characteristics of the grout formulation and evaluating the long-term performance of the grouted waste form. Preliminary assessments of the operational characteristics of the grout formulation show that the grout meets established criteria. Preliminary performance assessments indicate that the grouted waste form will provide long-term environmental protection. A series of laboratory and field tests are planned and ongoing to verify these assessments. 5 refs., 4 figs.

29965 **(PNL-SA—12953) Vitrification of high-level radioactive waste in a pilot-scale liquid-fed ceramic melter.** Bjorklund, W.J.; Holton, L.K.; Knowlton, D.E. (Pacific Northwest Labs., Richland, WA (USA)). Mar 1985. Contract AC06-76RL01830. 10p. (CONF-850314—68). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012447.

From Waste management '85; Tucson, AZ, USA (24 Mar 1985).

Under the sponsorship of the Nuclear Waste Treatment Program (NWTP), a high-level radioactive waste vitrification system has been installed in a Radiochemical Engineering Facility at Hanford, Washington. The facility is designed for remote operation of equipment using master-slave manipulators and overhead cranes. The pilot-scale radioactive system consists of a melter, canister handling turntable, glass-level detection system and supporting waste preparation, offgas treatment and condensate treatment systems. The vitrification system will be operated with radioactive wastes to test remote equipment features and process performance. Destructive and nondestructive methods will be used in the characterization of the waste glass product after canisters are filled with specific waste compositions. 4 refs., 9 figs.

29966 **(RFP—3746) Waste generation reduction: nitrates. FY 1984 status report.** Johnson, A.J.; Arnold, P.M. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 19 Apr 1985. Contract AC04-76DP03533. 16p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012067.

A study was initiated at Rocky Flats Plant (RFP) to develop and demonstrate technology to eliminate nitrates in low-level waste streams without generating objectionable oxides of nitrogen. Various chemical and thermal methods of denitrification were investigated earlier in this program. Work in FY 1984 was conducted on the Thagard High Temperature Fluid Wall Reactor (HTFWR) and on an aqueous two-step process. Preliminary tests were conducted on a plasma torch system. Testing was completed with actual RFP nitrate wastes on an aqueous process consisting of formic and sulfuric acid reflux, followed by evaporation of the liquid to dryness. Results from this process show promising nitrate destruction, but with production of some NO/sub x/ in the off-gas. Also completed in aqueous testing were laser excitation techniques, indicating that the high activation energy of the nitrate ion can be overcome with a simpler chemical reaction with additional energy applied. Experiments were conducted using an HTFWR to determine its nitrate/nitrite destruction efficiency on simulated RFP and Savannah River Plant waste streams. These streams included nitrate-contaminated soils and feeds containing surrogate fission products. Various additives were tested to enhance nitrate destruction, reduce NO/sub x/ off-gas generation, and produce an acceptable final waste form.

29967 (RHO-BW-CR—143P) MAGNUM-2D computer code: user's guide. England, R.L.; Kline, N.W.; Ekblad, K.J.; Baca, R.G. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jan 1985. Contract AC06-77RL01030. 176p. NTIS, PC A09/MF A01; 1; GPO Dep. File Number DE85013315.

Information relevant to the general use of the MAGNUM-2D computer code is presented. This computer code was developed for the purpose of modeling (i.e., simulating) the thermal and hydraulic conditions in the vicinity of a waste package emplaced in a deep geologic repository. The MAGNUM-2D computer computes (1) the temperature field surrounding the waste package as a function of the heat generation rate of the nuclear waste and thermal properties of the basalt and (2) the hydraulic head distribution and associated groundwater flow fields as a function of the temperature gradients and hydraulic properties of the basalt. MAGNUM-2D is a two-dimensional numerical model for transient or steady-state analysis of coupled heat transfer and groundwater flow in a fractured porous medium. The governing equations consist of a set of coupled, quasi-linear partial differential equations that are solved using a Galerkin finite-element technique. A Newton-Raphson algorithm is embedded in the Galerkin functional to formulate the problem in terms of the incremental changes in the dependent variables. Both triangular and quadrilateral finite elements are used to represent the continuum portions of the spatial domain. Line elements may be used to represent discrete conduits. 18 refs., 4 figs., 1 tab.

29968 (RHO-BW-SA—217P) Geology and basalt stratigraphy of the Weiser embayment, west-central Idaho. Fitzgerald, J.F. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 1984. Contract AC06-77RL01030. 139p. NTIS, PC A07/MF A01; 1; GPO Dep. File Number DE85011951.

This research was conducted as part of the regional Columbia Plateau mapping effort carried out in support of the Basalt Waste Isolation Project administered for the DOE by Rockwell Hanford Operations. The purpose of this study was to examine, in detail, the Columbia River Basalt Group of the Weiser embayment and do the following: (1) complete geologic mapping of the Weiser embayment, (2) integrate observations and findings from previous field projects conducted in scattered parts of the Weiser embayment, (3) establish a stratigraphic framework for Weiser embayment basalt flows and correlate it with the Columbia River Basalt Group stratigraphic framework established by Swanson et al. (1979b), (4) determine the structural setting of the Weiser embayment and attempt to relate it to the volcanic history and postextrusion structural evolution of the Columbia Plateau. 53 refs., 27 figs., 3 tabs.

29969 (SAND—84-0637) Reduction of the well test data for test well USW H-1, adjacent to Nevada Test Site, Nye County, Nevada. Barr, G.E. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 48p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85011866.

The drawdown and recovery data for three pump tests, three recovery tests and six injection tests in well USW H-1 are reduced to determine hydraulic conductivity and storativity, assuming the medium is homogeneous, isotropic, and porous. Conductivity ranges from about 10^{-5} m/s in the upper zone tested to 10^{-10} m/s in the lower test zone, and storativity ranges from about 5 x 10^{-7} to about 0.5. This study was conducted to support assessment of the behavior of the groundwater system at Yucca Mountain near the Nevada Test Site in southwest Nevada. After the work for the report was completed, the US Geological Survey published estimates of hydraulic conductivity based on the same test data analyzed here. This report is therefore also an independent confirmation of hydraulic conductivity estimates for well USW H-1 for the saturated zone, as well as a listing of storativity estimates. 5 refs., 23 figs., 3 tabs.

29970 (SAND—84-2015) Location recommendation for surface facilities for the prospective Yucca Mountain Nuclear Waste Repository. Neal, J.T. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1985. Contract AC04-76DP00789. 59p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85013169.

Six locations east of Yucca Mountain were evaluated for use as the site for repository surface facilities. Fourteen factors in three major categories were considered. These categories, in order of importance, were (1) preclosure radiological safety, (2) environmental quality, and (3) ease and cost of construction, operation, and closure. The evaluation factors and process closely followed the DOE siting guidelines (10 CFR Part 960). Site specific factors also were considered. The results indicate that the location immediately east of the northern portion of Exile Hill is preferred. We suggest the location be termed the "reference conceptual site" for use during the Conceptual Design phase of repository development. 18 refs., 2 figs., 5 tabs.

29971 (SAND—85-0807) Pretest reference calculation for the 18-W/m^2 Mockup for Defense High-Level Waste (WIPP Room A in situ experiment). Morgan, H.S.; Stone, C.M. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 89p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85012246.

A pretest reference calculation for the 18-W/m^2 Mockup for Defense High-Level Waste (DHLW) or Room A experiment is presented in this report. The mockup is one of several large scale in situ experiments currently under construction near Carlsbad, New Mexico, at the site of the Waste Isolation Pilot Plant (WIPP). The 18-W/m^2 test is an in situ experiment developed to simulate closely the Reference Repository Conditions (RRC) for DHLW in salt. The test consists of three long, parallel rooms (A1, A2, A3) which are heated by canister heaters placed in the floor of each room. These heaters produce thermal loading which simulates an areal heat output of 18-W/m^2 for Room A2, which is the focus of the experiment. This load will be supplied for a period of three years. Rooms A1, A2, and A3 are heavily instrumented for monitoring both temperature increases due to the thermal loading and deformations due to creep of the salt. Data from the experiment are not available at the present time, but the measurements for Room A2 will eventually be compared to the results for Room A2 presented here to assess and improve thermal and mechanical modeling capabilities for the WIPP. The thermal/structural model used here represents the state-of-the-art at the present time. A large number of plots are included since an appropriate result is presented for every Room A2 gauge location. 55 refs., 70 figs., 4 tabs.

29972 (SAND—85-0893) Pretest reference calculation for the 6.1 meter (20 ft) wide drifts of the Geomechanical Evaluation (WIPP Room G in situ experiment). Morgan, H.S.; Stone, C.M. (Sandia National Labs., Albuquerque, NM (USA)). Jun 1985. Contract AC04-76DP00789. 74p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85012247.

A pretest reference calculation for the Geomechanical Evaluation or Room G experiment is presented. The Geomechanical Evaluation is one of several large-scale in situ tests currently under construction near Carlsbad, New Mexico, at the site of the Waste Isolation Pilot Plant (WIPP). The Room G experiment consists of isolated, two-dimensional drifts with different room spans, an isolated drift intersection, and a wedge pillar. The primary purpose of the experiment is to provide data for validating computational modeling capabilities used in analyzing nuclear waste repositories in salt. The calculation presented here addresses only one portion of the test, namely isolated drift configurations which are initially 6.1 m (20 ft) wide by 3.05 m (10 ft) high. The Geomechanical Evaluation is heavily instrumented for monitoring deformations due to creep of the salt. Data from the experiment are not available at the present time, but the measurements for Room G will eventually be compared to the results presented in this report to assess and improve structural modeling capabilities for the WIPP. The model used for this calculation represents the state of the art at the present time. A large number of plots are included since an appropriate result is presented for every gage location associated with the 6.1 m wide drifts. 53 refs., 53 figs., 3 tabs.

29973 **(SKBF-KBS-TR—79-15) Costs for handling and disposal of high level radioactive wastes and spent fuels.** Finne, A.W. (ed.). (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Apr 1979. 38p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701280.

This report gives a calculation of costs for the handling and final storage of spent nuclear fuel in accordance with the KBS plans. The first report deals with the handling and final storage of vitrified high level waste, while the second deals with the direct disposal of spent nuclear fuel. In both cases, the proposed facilities are designed to handle all the fuel discharged from 13 reactors over a period of 30 years of operation, corresponding to about 9000 metric tons of uranium. In reality, it may be necessary to dispose of waste in accordance with both alternatives. The initial and operating costs have been calculated in 1978 monetary values for each alternative. Reprocessing is assumed to take place abroad, and the costs for this reprocessing are not specified in this report. The costs specified therefore do not reflect the total cost of the back end of the nuclear fuel cycle, but rather only the cost of the stages studied by KBS. The total costs for the vitrified reprocessing waste alternative have been calculated to be SEK 9000 million, while the total costs for the alternative with direct disposal of unreprocessed spent fuel have been calculated to be SEK 13 500 million. This does not include VAT or costs for the handling and disposal of low- and medium-level waste, nor does it include costs for decommissioning. The cost per produced kWh has been calculated with a real interest rate of 4 per cent, in which case it is about 0.004 SEK/kWh for both alternatives. Cost calculations for facilities that are to be built and operated for such a long period of time as we are concerned with here cannot, for natural reasons, be anything other than approximate. The merit of the present calculation over such a long period of time is also dubious.

29974 **(SKBF-KBS-TR—79-28) KBS annual report 1979. Including summaries of technical reports issued during 1979.** (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Mar 1980. 132p. NTIS (US Sales Only), PC A07/MF A01. File Number DE85701267.

KBS was organized by the Swedish Nuclear Power Utilities at the end of 1976. The first task was to perform the necessary studies and investigations to fulfill the requirements of a Swedish Law, demanding that the existence of a safe method for final storage of spent nuclear fuel of vitrified high-level waste must be shown before new nuclear power reactors may be taken into operation. During 1977 and 1978 two main reports have been presented on the subject. Handling of spent nuclear fuel and final storage of vitrified high-level reprocessing waste, and handling and final storage of unreprocessed spent nuclear fuel. This annual report for the KBS project gives a summary of the main activities during 1979. During the first months of the year most of the work was directed to supplementary site investigations connected with the licencing of two reactors according to the law mentioned above. After that period the responsibility of the project has been expanded to include also the low- and medium-activity waste both from reprocessing of nuclear fuel and the operations and decommissioning of nuclear power plants. After a chapter on the background of the project, the legal situation and the scientific reviews of the two main reports are presented. Chapters 4-10 present the main activities during the year within the areas of intereset for the project. In Chapter 10 (Safety Analysis) an emphasis is placed of the future plans with a discussion of areas where special efforts are needed. Chapter 11 gives an account for current and planned international cooperation in the abandoned mine at Stripa. Five appendices have been included giving 1) a list of the KBS Technical Reports issued during 1979 2) a list of authors 3) a key-word register 4) English summaries of the KBS Technical Reports and 5) SAC Technical Reports (Swedish-American cooperative investigations in the Stripa mine).

29975 **(SKBF-KBS-TR—80-24) Migration of radionuclides in fissured rock - The influence of micropore diffusion and longitudinal dispersion.** Rasmuson, A.; Neretnieks, I. (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Dec 1979. 54p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701269.

The migration of radionuclides in the fissures in the bedrock surrounding a repository is discussed. A one-dimensional transport model is presented. It includes diffusion of the nuclides into the microfissures of the rock, and linear sorption and longitudinal dispersion in the bedrock. An analytical solution to the model is given in terms of an infinite integral. The integrand is a sometimes highly oscillatory function of the system parameters. A special integration method is developed to evaluate the infinite integral. The method utilizes the oscillatory behavior of the integrand. The assessment of input parameters is discussed in some detail. Dimensionless breakthrough curves are given for the approximate range of variation of the input parameters. Calculations are made for a repository of spent fuel surrounded by fissured but fairly good rock (K(sub)p=10^{-9} m/s and fissure spacing S=50 m). Longitudinal dispersion may significantly affect the amount of radioactive material reaching the biosphere. Radionuclides, which would decay completely without longitudinal dispersion, may arrive in non-negligible concentrations. Dispersion effects of the magnitude considered in this study can significantly diminish the retardation effects of matrix diffusion.

29976 **(SKBF-KBS-TR—82-28) KBS annual report 1982. Summaries of technical reports issued during 1982.** (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Jul 1983. 54p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701271.

Summaries of 27 reports are listed.

The purpose of the KBS Annual Report is to inform interested organizations and individuals of the research and development work perfomed by the division KBS within the Swedish Nuclear Fuel Supply Co. (SKBF) on the handling, treatment and final storage of nuclear wastes in Sweden. In the Annual Report for 1982 the summaries of 27 technical reports and other publications issued during the year are listed.

29977 **(SKBF-KBS-TR—83-03) Smectite alteration.** Anderson, D.M. (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Feb 1983. 47p. (CONF-8205301—). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701272.

From Colloquium on smectite alteration; Buffalo, NY, USA (26 May 1982).

The colloquium was convened to compose a summary of the most recent data and the best scientific appraisal of present knowledge on the process of smectite conversion to illite. A brief account of a consensus view on the probable stability of smectite clays when employed as the buffer material in the Swedish nuclear fuel storage system. It is concluded that if the quantitiy of nuclear waste to be put in each bore hole is carefully limited, temperatures surrounding the cannister will not rise to an acceptable level and the clay buffer material can be relied upon to be effective throughout the life of the repository.

29978 **(SKBF-KBS-TR—83-31) Final disposal of spent nuclear fuel. Standard programme for site investigations.** Thoregren, U. (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Apr 1983. 43p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701273.

Like many other countries with similar geological conditions, Sweden plans to dispose of its long-lived radioactive nuclear waste by depositing it in final repositories located deep down in the crystalline bedrock. In order to be able to demonstrate that a given rock formation is suited for waste storage, it is necessary to have knowledge concerning its properties, particularly those that determine groundwater conditions and chemistry within the area. Also of importance are data that shed light on rock mechanics in the area and the occurrence of valuable minerals. The SKBF/KBS programme includes plans to carry out geological studies of 10-15 areas in different parts of the country during the 1980s. A standard programme for these studies is described in the following. The standard programme is intended to serve as a basis for planning of the work and revisions or modifications that may be found to be appropriate in view of local conditions or experience.

29979 (SKBF-KBS-TR—83-35) **Actinide solution equilibria and solubilities in geologic systems.** Allard, B. (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Apr 1983. 56p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701275.

Stability constants and solubility products for actinide (Th, U, Np, Pu and Am) hydroxide and carbonate complexes have been collected, and total solubilities have been calculated under conditions representative of deep granitic groundwaters (pH 7-9.5; high total carbonate concentration according to log $(CO_3)=0.76pH-10.83$; redox potentials corresponding to oxic systems, $Eh>0.8-0.06pH$, and reducing systems, $Eh<0.3-0.06pH$). The solubility limiting species under reducing systems are $ThO_2(s)$, $UO_2(s)$, $NpO_2(s)$, $PuO_2(s)$ and $Am_2(CO_3)_3(s)$m, respectively, and the corresponding calculated maximum solubilities are 3 times 10^{-10} M(0.07 μg/l) for Th, 0.3-250 times 10^{-10}M (0.01-6 μg/l) for U (depending on the carbonate concentration), 1 times 10^{-10} M(0.03 μg/l) for Np, 1-3 times 10^{-9} M (0.2-0.7 μg/l) for Pu and 0.6-2 times 10^{-7} M (15-50 μg/l) for Am. The calculated solubilities for U are in fair agreement with observed uranium concentrations in natural deep groundwaters. Hexavalent uranium carbonate species would dominate in solution except under highly reducing conditions ($Eh<0.2-0.06pH$) and low total carbonate concentrations. Under oxic conditions the concentrations of U and Np would be larger than 10^{-5}-10^{-6} M (mg/l-level).

29980 (SKBF-KBS-TR—83-67, pp 2.1-2.9) **Water flow in bedrock; estimation of influence of transmissive shaft and borehole.** Andersson, L.; Neretnieks, J.; Rasmuson, A. (Royal Institute of Technology. Department of Chemical Engineering). May 1983. NTIS (US Sales Only), PC A05/MF A01. File Number DE85780814.

In Some notes in connection with the studies of final disposal of spent fuel. Pt. 2.

The bedrock is a system of large and small fractures that permit water transport through the rock mass. The water content of the bedrock can, under varying hydrostatic pressure conditions, give rise to different flow patterns via boreholes or shafts drilled through the rock. A case is dealt with where a borehole connects a low point in the terrain with a point in the repository where the hydrostatic pressure is higher than at the mouth of the borehole. The situation may be conceived as having arisen when the area was investigated and a hole was drilled at an angle down from the valley to a point below the high point in the area. If the borehole is not sealed, an artesian well may be created. The conductivity used, 2 times 10^{-9} m/s, presumes that the repository has been emplaced in average quality rock at this depth. In reality, the repository site will be selected where the rock is better than average. In reality, a shaft - even if it is imperfectly backfilled - or a borehole exerts a flow resistance that reduces the available pressure difference at a depth of 500 m. Taken together, these factors indicate that approx. 5 m^3/(year, 5 m) is the water flow that can be expected to emerge from the repository through a shaft or a borehole. Only this flow can have been contaminated with escaping substances from the repository area. Water that flows in from other parts of the hole dilutes this flow considerably.

29981 (SKBF-KBS-TR—83-67, pp 1.1-1.5) **Note on the transport of hydrogen from a waste canister.** Neretnieks, I. May 1983. NTIS (US Sales Only), PC A05/MF A01. File Number DE85780814.

In Some notes in connection with the studies of final disposal of spent fuel. Pt. 2.

Hydrogen produced by radiolysis or corrosion within the backfill can be transported out to the water in the bedrock by three mechanisms. 1. Diffusion through stagnant water in backfill and porous rock matrix. 2. Diffusion through stagnant water in backfill and into the flowing water in the fissured rock. 3. By flow as a gas if the solubility is exceeded. The first two mechanisms will transport 0.01 - 0.15 moles/year H_2 gas dissolved in water at a pressure of 50 bar.

29982 (SKBF-KBS-TR—83-67, pp 4.1-4.34) **Some simple calculations of potential fields in rock mass underneath two typified topographies.** Andersson, L.; Neretnieks, J.; Rasmuson, A. (Royal Institute of Technology. Dept. of Chemical Engineering). May 1983. NTIS (US Sales Only), PC A05/MF A01. File Number DE85780814.

In Some notes in connection with the studies of final disposal of spent fuel. Pt. 2.

Potential fields and hydraulic gradients have been calculated for some typified topographies. In one case, a high cylindrical rock mass with a radius of 250 m has been assumed to be surrounded by a 10 m wide fracture zone. The fracture zone has been assigned a conductivity 100 and 10^8 times higher than that of the rock. The conductivity of the rock decreases with depth. The rock outside the fracture zone is assumed to be impervious. A conical water mound with a height of 10 m and a radius of 100 m is placed on the cylinder, which otherwise has a flat water surface. The water mound drives the water downward and out to the fracture zone, where it flows upward. The highest gradient at repository depth (approx. 500 m) is about 10^{-3} m H_2O/m. In another case, the rock mass has been given the form of a 500 m wide vertical slab of infinite extent in the plane of the slab. The same type of fracture zone as in the cylindrical case surrounds the slab on both its vertical sides. A water ridge with a height of 10 m and a 200 m base is placed symmetrically on the top surface of the slab. The maximum gradient at a depth of 500 m is now about 7 times 10^{-3} m H_2O/m. An isolated water mound contributes little towards driving the water at great depths. An elongated ridge has a greater influence. In a rock with a hydraulic conductivity of 10^{-10} m/s at a depth of 500 m, the flow in the ridge case would be about 0.02 $1/m^2$ year.

29983 (SKBF-KBS-TR—83-67) **Some notes in connection with the studies of final disposal of spent fuel. Pt. 2.** Neretnieks, I. (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). May 1983. 77p. NTIS (US Sales Only), PC A05/MF A01. File Number DE85780814.

Individual papers were processed separately for inclusion in the Energy Data Base.

29984 (SKBF-KBS-TR—83-70) **Analysis of groundwater from deep boreholes in Kamlunge.** Laurent, S. (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). May 1983. 54p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701276.

Groundwater from four boreholes in granitic rock at an investigation site in Kamlunge has been sampled and analysed. This is part of a larger program of geological, geophysical and hydrogeological investigations aimed at finding a suitable site for a high-level radioactive waste repository. One to four water-bearing levels in each borehole between a depth of 100 and 600 m were selected. Prior to sampling, the water-bearing level is isolated between packer sleeves. The water is then pumped to the surface where sensitive parameters such as redox potential, pH, sulphide and oxygen content are measured electrochemically on the flowing water in a system isolated from the air. Water, filter and gas samples are sent to several laboratories for further analysis. The present report is a presentation of the results of the groundwater analyses. The reliability of the results is discussed but there is no evaluation in relation to geology and hydrogeology. This report presents the basic results from the groundwater analyses to be further evaluated by experts in different fields.

29985 (SKBF-KBS-TR—83-77) **KBS Annual Report 1983. Including summaries of technical reports issued during 1983.** (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Jun 1984. 250p. NTIS (US Sales Only), PC A11/MF A01. File Number DE85701277.

Summaries of 76 reports are listed.

The purpose of the KBS Annual Report is to inform interested organizations and individuals of the research and development work performed by the division KBS within the Swedish Nuclear Fuel Supply Co (SKBF) on the handling, treatment and final storage of nuclear wastes in Sweden. The Annual Report normally contains a presentation of the legal and organizational situation followed by an account of the progress within different areas of the R and D-work. This account also includes indications of the activities planned for the future. At the end of the report the summaries of 76 technical reports and other publications issued during the year are listed in special appendices.

29986 **(SKBF-KBS-TR—84-03) Effect of β-radiolysis on the products from α-radiolysis of ground water.** Christensen, H.; Bjergbakke, E. (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Jul 1984. 22p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701278.

In a previous study it has been shown that α-radiolysis of a thin water film on spent fuel stored in copper canister may result in formation of substantial amounts of hydrogen and oxygen. In the present investigation the effect of low LET radiation, such as γ- and β-radiations, on these molecules when they diffuse out of the α-irradiated layer has been calculated using a computerized radiation chemical program. It has been found that low LET radiation under certain conditions may act as a recombiner for hydrogen and oxygen produced by α-radiolysis. The effect of γ-radiation outside the canister is small - due to the low dose rates prevailing there. However, the relatively high β-radiation field existing inside the fuel cladding recombines the major part of the hydrogen and oxygen produced by α-radiolysis of pure water, in particular if the gases have to diffuse out through bentonite.

29987 **(SSI-A—84-04) Examination of KBS-3 by SSI.** (Statens Straalskyddsinstitut, Stockholm (Sweden)). Feb 1983. 177p. (In Swedish). NTIS (US Sales Only), PC A09/MF A01. File Number DE85701279.

The National Institute of Radiation Protection has examined the basis for the application of the permission to load the nuclear reactors Forsmark-3 and Oskarshamn-3, regarding the special nuclear law. The Institute finds that the proposed method for handling and final disposal of spent nuclear fuel will comply with the above mentioned law regarding radiation protection. The law also requires a programme for research and development. No such programme has been distributed.

29988 **(UCRL—15667) Permeability and fluid chemistry studies of the Topopah Spring Member of the Paintbrush Tuff, Nevada Test Site: Part II.** Moore, D.E.; Morrow, C.A.; Byerlee, J.D. (Geological Survey, Menlo Park, CA (USA)). Mar 1985. Contract W-7405-ENG-48. 44p. (SANL—126-016). NTIS, PC A03/MF A01; GPO Dep. File Number DE85012967.

Open-File Report 84-848.

The Topopah Spring Member of the Paintbrush Tuff is being considered as a possible emplacement horizon for the disposal of nuclear waste. The permeability and pore-fluid chemistry of the Topopah Spring Member have been investigated experimentally. The work reported here represents a continuation of previous permeability studies on the Topopah Spring Member. Three experiments were run, to test the effect of pore pressure, sample orientation, and flow direction on permeability and pore fluid chemistry. In the experiments, water flowed either up or down a temperature gradient established across the tuff sample in response to a small pore pressure gradient. The maximum temperature of the gradient was 150°C, and the minimum was 43 to 45°C. The confining pressure was 100 bars, corresponding to a disposal depth of 400 meters. J13 water was the starting pore fluid. The heated tuff samples showed few changes in permeability from their initial, room-temperature values. In addition, the fluids discharged from both the low and high-temperature sides of the tuff samples were dilute, nearly neutral solutions whose compositions did not differ greatly from the starting J13 compositions. 16 refs., 14 figs., 4 tabs.

29989 **(UCRL—53381) Structural geology report: Spent Fuel Test - Climax Nevada Test Site.** Wilder, D.G.; Yow, J.L. Jr. (Lawrence Livermore National Lab., CA (USA)). Oct 1984. Contract W-7405-ENG-48. 45p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012542.

We performed underground mapping and core logging in the Climax Stock, a granitic intrusive at the Nevada Test Site, as part of a major field test to determine the feasibility of using granitic or crystalline rock for the underground storage of spent fuel from a nuclear reactor. This mapping and logging identified more than 2500 fractures, over 1500 of which were described in enough detail to allow statistical analyses and orientation studies to be performed. We identified eight joint sets, three major shear sets, and a fault zone within the Spent Fuel Test - Climax (SFT-C) portion of the Stock. Joint sets identified within the SFT-C and elsewhere in the Stock correlated well. The orientations of joint sets identified by other investigators were consistent with our findings, indicating that the joint sets are persistent and have a relatively uniform orientation throughout a major portion of the Stock. The one joint set not seen elsewhere in the Stock is healed and the wall rock is altered, implying that healed joints were not included in the mapping criteria used by other investigators. The shear sets were distinguished from the joint sets by virtue of crushed minerals, continuous clay infilling, and other evidences of shearing, and from faults by the lack of offsetting. Previous investigators working mainly in the Pile Driver Drifts identified two of the shear sets. The third set, being nearly parallel to these Drifts had not been identified previously. The fault zone identified at the far (Receiving Room) end of the project is oriented approximately N45°E-75°SE, similar to both the Boundary and Shaft Station Faults. We have, therefore, concluded that the Receiving Room Fault is one of a series of normal faults that occur within the Climax Stock and that are possibly related, in both age and genesis, to the Boundary Fault. 52 refs., 26 figs., 11 tabs.

29990 **(USGS-OFR—85-224) Uranium, thorium isotopic analyses and uranium-series ages of calcite and opal, and stable isotopic compositions of calcite from drill cores UE25a No. 1, USW G-2 and USW G-3/GU-3, Yucca Mountain, Nevada.** Szabo, B.J.; Kyser, T.K. (Geological Survey, Denver, CO (USA)). 1985. Contract AI08-78ET44802. 29p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013039.

Fracture and cavity filling calcite and opal in the unsaturated zone of three drill cores at Yucca Mountain were analyzed for uranium and stable isotope contents, and were dated by the uranium-series method. Stable isotope data indicate that the water from which the calcite precipitated was meteoric in origin. The decrease in ^{18}O and increase in ^{13}C with depth are interpreted as being due to the increase in temperature in drill holes corresponding to an estimated maximum geothermal gradient of 43° per km. Of the eighteen calcite and opal deposits dated, four of the calcite and all four of the opal deposits yield dates older than 400,000 years and ten of the remaining calcite deposits yield dates between 26,000 and 310,000 years. The stable isotope and uranium data together with the finite uranium-series dates of precipitation suggest a complex history of fluid movements, rock and water interactions, and episodes of fracture filling during the last 310,000 years. 10 refs., 7 figs., 4 tabs.

29991 **(Y/OWI/SUB—7414/1) Salt deposits in the United States and regional geologic characteristics important for storage of radioactive waste.** Johnson, K.S.; Gonzales, S. (Oklahoma Univ., Norman (USA); Georgia Univ., Athens (USA); Earth Resource Associates, Inc., Athens, GA (USA)). Mar 1978. Contract AC05-84OR21400. 192p. NTIS, PC A09/MF A01; GPO Dep. File Number DE85013319.

A repository for radioactive waste must isolate radionuclides from the biosphere for long periods of geologic time, during which time the radionuclides would decay to the point where they no longer represent a hazard to man and his ecosystem. Burial of waste in a solidified form in subsurface geologic formations has been considered the most effective and most practical means of isolation, and the characteristics of thick deposits of rock salt make these deposits a desirable medium for such geologic isolation. This report brings together an extensive body of data on the distribution and geology of rock-salt deposits in the United States and discusses for each salt deposit the regional geologic characteristics that relate to its general suitability for the possible storage or disposal of radioactive waste. These regional geologic characteristics include the thickness, depth, lateral continuity, homogeneity, and dissolution of salt beds, as well as the geologic structure, hydrology, and seismic activity of the region. Other characteristics include the nature of rock units adjacent to the salt, the potential for present or future development of mineral resources, and the location of boreholes and other man-made excavations that penetrate the salt. 282 refs., 68 figs., 3 tabs.

29992 Porous metal filter collects radioactive strontium in hot cell operation. Fulton, J.; Hodel, A.E. (Rockwell Hanford Operations, Richland, WA). *Chemical Processing (Chicago);* 88-89(Mar 1985).

The separation of a purified inorganic salt from a batch of slurry containing a high level radionuclide presented some unusual requirements at Rockwell Hanford's fission products production facility in Richland, WA. The product, radioactive strontium, is encapsulated as purified strontium fluoride after the recovered precipitate is sintered in a furnace to drive off all volatiles. The separation process required a filter to collect the finely divided strontium fluoride particles. The filter is required to withstand temperatures of 300-400°C and maintain chemical stability in high levels of radioactivity. The filter also has to be sturdy enough to be manageable by a remote master/slave electromechanical manipulator in a hot cell. In addition, the filter must withstand a corrosive environment where the potential of traces of hydrofluoric acid exists. A uniformly permeable filter medium with low pressure drop and high particulate removal efficiency was necessary to ensure total recovery and clean filtrate. Strontium fluoride is precipitated batchwise from a reaction between sodium fluoride and strontium nitrate. After chemical adjustments are completed, the whole batch is filtered through a bank of four vacuum filters which contain a porous metal filter medium. Cylinders of sintered porous stainless steel were chosen as the filter medium because they were adaptable to the handling requirements and met the stringent separation criteria. The overall reaction-to-encapsulation operation at Rockwell Hanford has been developed to achieve better than 99% recovery of the strontium. The consistent performance of the porous metal cartridge filter medium has played an important part in maintaining this high recovery.

29993 Method for recovery of actinides from actinide-bearing scrap and waste nuclear material using O_2F_2. Asprey, L.B.; Eller, P.G. (to Dept. of Energy). US Patent Application 6-649,626. 12 Sep 1984. 8p. Contract W-7405-ENG-36.

Method for recovery of actinides from nuclear waste material containing sintered and other oxides thereof and from scrap materials containing the metal actinides using O_2F_2 to generate the hexafluorides of the actinides present therein. The fluorinating agent, O_2F_2, has been observed to perform the above-described tasks at sufficiently low temperatures that there is virtually no damage to the containment vessels. Moreover, the resulting actinide hexafluorides are not detroyed by high temperature reactions with the walls of the reaction vessel. Dioxygen difluoride is readily prepared, stored and transferred to the place of reaction.

29994 Interim stabilization of uranium mill tailings. Elmore, M.R.; Hartley, J.N.; Li, C.T. (Battelle Pacific Northwest Lab., Richland, WA). pp 91-99 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

This paper presents the results of a literature review of dust suppression technology and laboratory screening tests, and describes a field test conducted at a uranium mill. Thirty four chemical stabilizers were evaluated in a series of laboratory wind tunnel tests performed at the Pacific Northwest Laboratory. The most effective stabilizers identified during the laboratory screening tests were applied to the surface of uranium mill tailings at a mill in Wyoming. Topics considered include sources of fugitive dust, mechanisms of wind erosion, fugitive dust control methods (physical methods, chemical methods, biological methods), and selecting a stabilizer. It is concluded that the selection of the most appropriate method depends on site-specific conditions, including tailings particle size distribution, tailings chemistry, climate, site preparation requirements, and potential environmental effects.

29995 Evaluation of inactive uranium mill tailings sites for liner requirements: Characterization and interaction of tailings, soil, and liner materials. Relyea, J.F.; Martin, W.J. (Battelle Pacific Northwest Lab., Richland, WA). pp 507-519 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

This paper summarizes the results of laboratory experiments using soils from Clive, Utah and tailings samples from three inactive uranium processing sites. The results are to be used to predict contaminant behavior for comparison with the regulatory criteria to decide whether a liner is needed. The interactions of leachates with soils and liner material were studied using both batch and column methods. It is determined that batch leaching tests are suitable for screening a large number of tailings samples for relative contaminant concentrations between samples but not for determining contaminant concentrations and release rates in tailings leachate. The results of column leaching tests on samples of tailings from inactive sites indicate that contaminant concentrations are highest in initial leachate from the columns and that concentrations decrease by an order of magnitude or more after one pore volume.

29996 Recent hydrological observations from the Riverton and Maybell tailings piles. Tokunaga, T.; Narasimhan, T.N. (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA). pp 463-473 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

This paper reports on field and laboratory hydrologic studies of two inactive uranium mill tailings piles under the Uranium Mill Tailings Remedial Action Program (UMTRA). The ultimate goal of the studies is to evaluate the nature of the contaminant potential of the piles with sufficient detail so that appropriate remedial measures can be designed and implemented under the UMTRA Program. The field studies included the monitoring of hydraulic head profiles of the piles and infiltration tests. Both the field and laboratory results from the Riverton tailings indicate a great deal of spatial variability in hydraulic properties. It is determined that the bulk of the precipitation input at the Riverton tailings is lost by evapotranspiration within the upper meter of soil cover and tailings.

29997 A field experiment on tailings reclamation: radon flux versus earthen cover depth. Hinton, T.; Whicker, F.W. (Pathfinder Mines Corp., Shirley Basin, WY). pp 421-432 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

Design and construction techniques are described for a 1.6 hectare (4 acre) experimental uranium tailings reclamation plot. A brief review of the objectives of the experiment are discussed along with initial survey methods used to characterize the plot. These include analysis of the source term, overburden, first year vegetation, moisture determination with a neutron probe and gross alpha and gamma surveys. The radon exhalation versus overburden depth experiment is discussed in detail. Radon flux from tailings covered with 1.5 m (5') or more of earthen material was not distinguishable from background fluxes. Problems associated with high variability among replicates within the same treatment areas are discussed.

29998 Effect of rock cover on multilayer radon barrier effectiveness. Kirkham, R.R.; Beedlow, P.A.; Gee, G.W. (Battelle Pacific Northwest Lab., Richland, WA). pp 409-419 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

This paper presents the field data collected to evaluate the effect of vegetation and rock covers on multilayer radon barriers and provides data for modeling studies. Radon flux and soil moisture data were collected to determine the effect of vegetation and rock erosion control covers on a multilayer barrier. The multilayer barrier is composed of a low-porosity, clay-rock mixture hydrologically isolated by a gravel layer from the protective overburden soil material. The results indicate that the rock barrier increased the soil moisture content of the underlying soils. It is concluded that if rock covers are used as stabilization treatments in remedial action programs, new measurement procedures must eliminate the measurement inaccuracies caused by rock covers.

29999 **A systematic approach to designing surface covers for uranium mill tailings.** Beedlow, P.A.; Cadwell, L.L.; McShane, M.C. (Pacific Northwest Lab., Richland, WA). pp 397-407 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

The wide range of existing environmental conditions and available cover materials at uranium mill tailings sites precludes the use of a single surface cover for effective long-term erosion resistance. The UMTRA program is developing site-specific guidelines for designing effective and lasting surface covers. This paper presents a systematic approach to designing surface covers for tailings that can be tailored to conditions at any site. The approach consists of three phases: 1) An assessment, during which the degree of required surface protection (erosion potential) is determined. 2) A preliminary design that integrates surface cover design with the need to minimize transport of radon and leachates from the tailings. 3) A final design, where the cost and effectiveness of the surface cover are determined.

30000 **Cost and effectiveness of radon barrier systems.** Baker, E.G.; Freeman, H.D.; Gee, G.W.; Hartley, J.N. (Pacific Northwest Lab., Richland, WA). pp 383-395 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

This paper estimates the cost of the earthen, asphalt, and multilayer covers for three tailings piles designated high priority by the US DOE. The sensitivity of the cost of the radon barrier systems to the radon flux reduction which must be achieved, the amount of cover material required to obtain the desired flux reduction, and the exact location of the disposal sites is examined. The three types of covers were field tested at the Pacific Northwest Laboratory. The cost estimates for the three high priority western sites indicate that 3m of earthen cover is the least costly radon barrier when earthen material is available at or near the disposal site.

30001 **Radon emanation characteristics of uranium mill tailings.** Nielson, K.K.; Freeman, H.D.; Hartley, J.N.; Mauch, M.L.; Rogers, V.C. (Rogers & Associates Engineering Corp., Salt Lake City, UT). pp 355-367 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

Radon emanation from uranium mill tailings was examined with respect to the mechanisms of emanation and the physical properties of the tailings which affect emanation. Radon emanation coefficients were measured at ambient moisture on 135 samples from the 1981 field test site at the Grand Junction tailings pile. These coefficients showed a similar trend with moisture to those observed previously with uranium ores, and averaged 0.10 + or - 0.02 at dryness and 0.38 + or - 0.04 for all samples having greater than five weight-percent moisture. Small differences were noted between the maximum values of the coefficients for the sand and slime fractions of the tailings. Separate measurements on tailings from the Vitro tailings pile exhibited much lower emanation coefficients for moist samples, and similar coefficients for dry samples. Alternative emanation measurement techniques were examined and procedures are recommended for use in future work.

30002 **Interaction of acidic leachate with soil materials at Lucky McPathfinder mill, Gas Hills, Wyoming.** Erikson, R.L.; Sherwood, D.R. (Pacific Northwest Lab., Richland, WA). pp 335-351 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

This paper investigates the interaction of tailings liquor with sediments beneath an evaporation pond. The problems examined include the transport of radionuclides through pond sediments, the advance of the pH front, and mineralogical changes caused by soil/leachate content. The results are used to document the effectiveness of the native soil as a barrier for the transport of contaminants and as a qualitative indicator of the chemical stability of the mineral assemblage in the native soil. Sediment samples were collected to depths of 60 cm at six locations on the pond bottom while the pond was temporarily drained. The results indicate that the Forelle-Patent alluvium is an effective barrier to radionuclide migration. It is determined that the radionuclide concentrations on the soil profile are near background levels at a depth of 60 cm whereas the calculated solution seepage front may have reached 11.4 m in the 4-yr contact time.

30003 **Chemical transport beneath a uranium mill tailings pile, Riverton, Wyoming.** White, A.F.; Delany, J.M. (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA). pp 295-313 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

This paper reports on a detailed geochemical study conducted at the Riverton site in order to define the nature of chemical transport between an inactive tailings pile and the relationships between the underlying shallow groundwater system. Topics considered include regional isotope hydrology and geochemistry, evidence for the chemical contamination of shallow aquifers, and chemical reactions. The chemical speciation code, PHREEQE, was used to model mixing reactions, assuming a hydrologically static system. The simulations estimate one percent mixing of tailings-pore water with groundwater from the shallow alluvial aquifer.

30004 **Riprap Design considerations for long-term protection of uranium mill tailings.** Walters, W.H. (Battelle Pacific Northwest Lab., Richland, WA). pp 117-126 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

As part of a Nuclear Regulatory Commission (NRC) study to assess the long-term protection of retired uranium mill tailings, the Pacific Northwest Laboratory (PNL) has reviewed the processes of water erosion and the protection requirements of earthen radon suppression covers. Existing and proposed designs of the covers are briefly presented here. The Riprap Design with Safety Factor Method is recommended for uranium mill tailings impoundments. The basic steps required in designing riprap to protect against flood erosion are discussed in this paper and other design criteria related to the problems of long-term protection are identified.

30005 **A review of long-term rock durability: Implications for survivability of riprap used to protect uranium mill tailings.** Lindsey, C.G.; Doesburg, J.M.; Vallario, R.W. (Pacific Northwest Lab., Battelle Memorial Inst., Richland, WA). pp 101-115 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

This paper reviews information on rock weathering and riprap durability. Chemical and physical weathering processes, rock characteristics related to durability, and the role of climate in rock weathering are discussed. Current testing procedures for assessing riprap durability, and the reliability of these procedures, are examined. Salient geological and petrological properties of rock that may be selected for use as uranium mill tailings riprap are investigated. It is determined that riprap durability depends on the weathering environment and the lithological properties of the material chosen for the riprap. The results indicate that certain rock types may be suitable for mill tailings armoring, including varieties of igneous rocks (e.g., rhyolites and fine-granitic gneisses), and perhaps a few sedimentary rocks and granitic gneisses), and perhaps a few sedimentary rocks (e.g. limestones).

30006 **Interior drains for open pit disposal of uranium mill tailings.** Staub, W.P. (Oak Ridge National Lab., Oak Ridge, TN). pp 113-126 of Uranium Mill Tailings Management, Vol. II. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1978). (CONF-781127—).

From Symposium on uranium tailings disposal; Fort Collins, CO, USA (20 Nov 1978).

A conceptualized interior drainage system is presented for reducing the environmental impact on natural groundwater by disposal of uranium mill tailings in a mined-out open pit. The evaporation/seepage ratio can be increased through the use of interior drains, long-term monitoring of groundwater quality can be eliminated, and the open pit will not require an extensive liner. Other advantages not related to groundwater are: control of fugitive dust and radon emanation during mill operations and timely reclamation after the impoundment is filled with tailings.

30007 (AECL—8253) **Migration of radionuclides in unconsolidated materials. Equilibrium transport models.** Moltyaner, G.L. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Dec 1983. 29p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701514.

Analytical models for predicting radionuclide transport in shallow groundwater flow systems are developed. General-form solutions for a single radionuclide and for a multi-member decay chain of radionuclides are given for semi-infinite media. The solutions are presented for the first and third type time-dependent boundary conditions (time-dependent concentration and time-dependent flux at the hypothetical radionuclide emergence zone from the hard rock formations in the shallow groundwater system). Solutions for a single radionuclide are presented for several types of radionuclide input conditions, which provide a means for determining physiochemical parameters controlling radionuclide transport in porous media. Although the solutions for multi-member decay chains are derived for specific types of conditions, to allow for time delay from the vault to the biosphere, the results can be easily extended to any type of input conditions through the use of the superposition principle.

30008 (AERE-R—11240) **Migration processes in a model deep repository for the disposal of intermediate level nuclear waste.** Sharland, S.M.; Tasker, P.W. (UKAEA Atomic Energy Research Establishment, Harwell. Theoretical Physics Div.). Jun 1984. 56p. HMSO, London, price Pound 5.00.

It is difficult to conceive of radionuclides escaping from a repository by any means other than migration in groundwater. Simple models of the repository are constructed and various migration processes are identified and assessed, according to the flow speed of water through the repository. Diffusion in static water and advection in fast flows are considered separately initially, but later we examine the effect of slow flows in which both these processes contribute to the removal of radionuclides. Concentration profiles across the repository, fluxes of nuclides and total losses are obtained from the analysis. We investigate the time scales necessary for the steady state to be achieved in the repository and conclude that flow speed is roughly inversely proportional to this time scale, i.e. faster flows establish a steady state sooner than slow ones. We also assess the sensitivity of the results to the physical properties of the components of the repository.

30011 (NIRS-M—41, pp 242-261) **Tritium transport around nuclear faciliteis.** Murphy, C.E. Jr.; Sweet, C.W. (Savannah River Ecology Lab., Aiken, SC (USA)). Mar 1982. NTIS (US Sales Only), PC A15/MF A01. File Number DE85781031. (CONF-811082—).

From Workshop on tritium radiobiology and health physics; Chiba, Japan (1 Oct 1981).

The transport and cycling of tritium around nuclear facilities is reviewed with special emphasis on studies at the Savannah River Laboratory, Aiken, South Carolina. These studies have shown that the rate of deposition from the atmosphere, the site of deposition, and the subsequent cycling are strongly influenced by the compound with which the tritium is associated. Tritiated hydrogen is largely deposited in the soil, while tritiated water is deposited in the greatest quantity in the vegetation. Tritiated hydrogen is converted in the soil to tritiated water that leaves the soil slowly, through drainage and transpiration. Tritiated water deposited directly to the vegetation leaves the vegetation more rapidly after exposure. Only a small part of the tritium entering the vegetation becomes bound in organic molecules. However, it appears that the existence of soil organic compounds with tritium concentrations greater than the equilibrium concentration in the associated water can be explained by direct metabolism of tritiated hydrogen in vegetation.

30012 (NIRS-M—41, pp 271-284) **Environmental tritium monitoring around Tokai Reprocessing Plant.** Yamato, A. (Power Reactor and Nuclear Fuel Development Corp., Tokai, Ibaraki (Japan). Tokai Works). Mar 1982. NTIS (US Sales Only), PC A15/MF A01. File Number DE85781031. (CONF-811082—).

From Workshop on tritium radiobiology and health physics; Chiba, Japan (1 Oct 1981).

The environmental tritium monitoring in the sea near Tokai Reprocessing Plant has been performed since 1977, the year of having started the hot test operation of the plant. On the other hand, atmospheric tritium monitoring was started almost at the same time as a research program instead of a routine program. This paper is a review for tritium monitoring in the sea and in the air around the Tokai Reprocessing Plant. The plant is located in Tokai Village, Ibaraki Prefecture, on the Pacific coast. It is based on the Purex process, and the nominal capacity is 210 tons per year. Around the TRP, there are four uranium fabrication facilities, five research reactors, two power reactors and other research facilities. About 173,000 inhabitants are within 10 km range from the plant. The authorized discharge limit of tritium is 200 Ci per day and 51,100 Ci per year in the sea. That in the atmosphere is 50 Ci per day and about 15,000 Ci per year. The tritium from the TRP was discharged mainly into the sea. The sea water samples were distilled, and the tritium concentration was measured by liquid scintillation counting. During three years of the hot operation of TRP, discharged tritium was about 7,000 Ci into the sea and about 140 Ci into the atmosphere. The tritium level has been maintained, and its significant increase was not observed.

30013 **(OSS/RR—3) Limnological survey of the Alligator Rivers Region. 1. Diatoms (Bacillariophyceae) of the region.** Thomas, D.P. (Office of the Supervising Scientist for the Alligator Rivers Region, Sydney (Australia)). Aug 1983. 152p. NTIS (US Sales Only), PC A08/MF A01. File Number DE85701052.

This study was undertaken as part of a study of the algae of the Alligator Rivers Region in general, and of the Magela Creek in particular, to support an investigation into the possible use of native algae as an indicator of any changes in water quality which might occur as a result of uranium mining and milling in the Region.

30014 **(OSS/TM—6) Dietary pathways through lizards of the Alligator Rivers Region.** James, C.D.; Morton, S.R.; Braithwaite, R.W.; Wombey, J.C. (Office of the Supervising Scientist for the Alligator Rivers Region, Sydney (Australia)). Jul 1984. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701053.

A broad survey of the diets of 46 species of terrestrial and arboreal lizards from the families Gekkonidae, Pygopodidae, Agamidae and Scincidae was carried out in the Alligator Rivers Region, and the diets of three of the species were examined in detail by monthly sampling near the Ranger uranium mine. The study shows that, in the event of contamination of the waterbodies, only two species of lizards face any risk of contamination through their food.

30016 **(PNL—4980-Exec.Summ.) Guidelines for selecting codes for ground-water transport modeling of low-level waste burial sites. Executive summary.** Simmons, C.S.; Cole, C.R. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 47p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013177.

This document was written to provide guidance to managers and site operators on how ground-water transport codes should be selected for assessing burial site performance. There is a need for a formal approach to selecting appropriate codes from the multitude of potentially useful ground-water transport codes that are currently available. Code selection is a problem that requires more than merely considering mathematical equation-solving methods. These guidelines are very general and flexible and are also meant for developing systems simulation models to be used to assess the environmental safety of low-level waste burial facilities. Code selection is only a single aspect of the overall objective of developing a systems simulation model for a burial site. The guidance given here is mainly directed toward applications-oriented users, but managers and site operators need to be familiar with this information to direct the development of scientifically credible and defensible transport assessment models. Some specific advice for managers and site operators on how to direct a modeling exercise is based on the following five steps: identify specific questions and study objectives; establish costs and schedules for achieving answers; enlist the aid of professional model applications group; decide on approach with applications group and guide code selection; and facilitate the availability of site-specific data. These five steps for managers/site operators are discussed in detail following an explanation of the nine systems model development steps, which are presented first to clarify what code selection entails.

30017 **(RHO-BW-ST—70P) Groundwater travel time uncertainty analysis. Sensitivity of results to model geometry, and correlations and cross correlations among input parameters.** Clifton, P.M. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Mar 1985. Contract AC06-77RL01030. 78p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85013499.

This study examines the sensitivity of the travel time distribution predicted by a reference case model to (1) scale of representation of the model parameters, (2) size of the model domain, (3) correlation range of log-transmissivity, and (4) cross correlations between transmissivity and effective thickness. The basis for the reference model is the preliminary stochastic travel time model previously documented by the Basalt Waste Isolation Project. Results of this study show the following. The variability of the predicted travel times can be adequately represented when the ratio between the size of the zones used to represent the model parameters and the log-transmissivity correlation range is less than about one-fifth. The size of the model domain and the types of boundary conditions can have a strong impact on the distribution of travel times. Longer log-transmissivity correlation ranges cause larger variability in the predicted travel times. Positive cross correlation between transmissivity and effective thickness causes a decrease in the travel time variability. These results demonstrate the need for a sound conceptual model prior to conducting a stochastic travel time analysis.

30018 **(RISO-M—2435) New stack effluent monitoring system at the Risoe Hot Cell plant.** Boetter-Jensen, L.; Hedemann Jensen, P.; Lauridsen, B. (Risoe National Lab., Roskilde (Denmark)). Jun 1984. 50p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701233.

Also available from Risoe Library, DK-4000 Roskilde, Denmark.

This report describes a new stack effluent monitoring system that has been installed at the Hot Cell facility. It is an integrating iodine/particulate system consisting of a γ-shielded flow house in which a continous air sample from the ventilation channel is sucked through coal and glass filter papers. Activity is accumulated on the filter papers and a thin plastic scintillator detects the β-radiation from the trapped iodine or particulate activity. The stack effluent monitoring system has a two-step regulating function as applied to the ventilation system, first switching it to a recirculating mode, and finally to building-seal after given releases of ^{131}I. The collection efficiency for iodine in form of elementary iodine (I_2) and methyliodide (CH_3I) has been determined experimentally. The unwanted response from a noble gas release has also been determined from experiments. The noble gas response was determined from puff releases of the nuclide ^{41}Ar in the concrete cells. It is concluded that the iodine/particulate system is extremely sensitive and that it can easily detect iodine or particulate releases as low as a few MBq. A gamma monitor placed in connection with the iodine/particulate system detects Xe/Kr-releases as low as a few tens of MBq per second.

30019 **(SAND—84-0996) Benchmarking NNWSI flow and transport codes: COVE 1 results.** Hayden, N.K. (Sandia National Labs., Albuquerque, NM (USA)). Jun 1985. Contract AC04-76DP00789. 113p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85012245.

The code verification (COVE) activity of the Nevada Nuclear Waste Storage Investigations (NNWSI) Project is the first step in certification of flow and transport codes used for NNWSI performance assessments of a geologic repository for disposing of high-level radioactive wastes. The goals of the COVE activity are (1) to demonstrate and compare the numerical accuracy and sensitivity of certain codes, (2) to identify and resolve problems in running typical NNWSI performance assessment calculations, and (3) to evaluate computer requirements for running the codes. This report describes the work done for COVE 1, the first step in benchmarking some of the codes. Isothermal calculations for the COVE 1 benchmarking have been completed using the hydrologic flow codes SAGUARO, TRUST, and GWVIP; the radionuclide transport codes FEMTRAN and TRUMP; and the coupled flow and transport code TRACR3D. This report presents the results of three cases of the benchmarking problem solved for COVE 1, a comparison of the results, questions raised regarding sensitivities to modeling techniques, and conclusions drawn regarding the status and numerical sensitivities of the codes. 30 refs.

30020 **(SKBF-KBS-TR—83-67, pp 3.1-3.14) Note on the impact of transverse dispersion and immediately dissolved radionuclides.** Rasmuson, A.; Neretnieks, J. (Royal Inst. of Technology. Dept. of Chemical Engineering). May 1983. NTIS (US Sales Only), PC A05/MF A01. File Number DE85780814.

In Some notes in connection with the studies of final disposal of spent fuel. Pt. 2.

The leach rate of highly soluble species such as iodine has been estimated using a tank reactor model. The species are assumed to dissolve in the stagnant pore water (a few thousand liters) in the backfill and to be carried away by the equivalent flowrate in the bedrock (less than 1 liter of water per canister and year). The resulting time constant indicates that half of the species will be leached in a few thousand years. When a single canister is leached the axial and transverse dispersion will dilute the species in time and space. Sample calculations show that for iodine the concentration 100 m downstream from the canister will be diluted by transverse dispersion to a considerable extent. In the calculated example a factor 1000 was obtained. Axial dispersion is of no importance as the leach time (> 1000 yrs) is much longer than the travel time.

30021 **Recent radiochemistry observations at the Riverton and Maybell tailings piles.** Smith, A.R.; Moed, B.A. (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA). pp 205-221 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ. (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

Preliminary results are presented from the radiochemistry effort of the Lawrence Berkeley Laboratory integrated study of the inactive uranium mill tailings sites at Riverton, Wyoming and Maybell, Colorado. These results were obtained primarily by use of Y-ray spectrometric techniques, and included both field and laboratory application of NaI(T1) crystal and Ge-semiconductor detector systems. Current interpretation of this evidence indicates there has been downward migration of uranium within the tailings column since its emplacement, and upward movement of several radionuclides from the tailings into the overlying cover material. The mechanisms responsible for these migrations are believed to involve fluid transport, and are further believed to be active at the present time.

30022 **(AERE-R—11426) Investigation of the liability of surface contamination arising from plutonium containing solutions.** Wilkins, J.D.; Wisbey, S.J. (UKAEA Atomic Energy Research Establishment, Harwell. Chemistry Div.). Sep 1984. 39p. HMSO, London, price Pound 5.00.

The mechanism of contamination from plutonium containing solutions has been studied using ^{238}Pu as a tracer. A double-contamination technique has been used to measure the lability of surface-adsorbed contamination, arising from both plutonium 'polymer', and ionic plutonium solutions. The effect of ageing the contamination solutions, and of changing the contact times has been studied. The results have been interpreted using a model similar to that used for adsorption of organic polymers onto surfaces.

30023 **(BNL—36390-Rev.) Risk comparisons for the transportation of spent fuel from nuclear reactors.** Hull, A.P.; Lessard, E.T. (Brookhaven National Lab., Upton, NY (USA)). Apr 1985. Contract AC02-76CH00016. 9p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012509.

In summary, on the basis of calculated estimates, tests and accident statistics, the transport of spent nuclear fuel by whatever means has been shown to represent an infinitesimally small risk to the public, wherever they may be located enroute. This conclusion is based on three points (1) the probability of an accident involving spent fuel is small, (2) the probability that this hypothetical accident releases radioactive materials is even smaller and (3) the public-health consequences of such a release are trivial. It hardly seems to warrant the extensive assessment that it has received. If the risk to the public is of concern, this attention and analysis might have been more profitably spent on the improvement of the safety of the transport of a wide variety of other hazardous substances, which at present are given little if any prior scrutiny.

30024 **(DOE/OR/20722—27-Vol.1) Phase II remedial action at the former Middlesex Sampling Plant site and associated properties. Final report. Volume 1.** (Bechtel National, Inc., Oak Ridge, TN (USA). Advanced Technology Div.). Apr 1985. Contract AC05-81OR20722. 113p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85009915.

The former Middlesex Sampling Plant (MSP) and several adjacent and vicinity properties in Middlesex and Piscataway, New Jersey were designated in 1976 for remedial action under the Formerly Utilized Sites Remedial Action Program (FUSRAP). During the period 1943-55 uranium and thorium ores and concentrates were processed at the plant. Consequently, the plant site and several nearby properties were contaminated with radioactive residues. Phase I work comprised the construction of an impervious asphalt storage pad and drainage system at the former MSP site as well as decontamination of two properties adjacent to the site and three properties in the vicinity. Phase II involved cleanup of low-level radioactive waste that had migrated onto other properties adjacent to the site, the construction of an extension to the waste storage pad, and the installation there of a treatment system for rain runoff. All parcels were cleaned to the remedial action criterion level of 5 pCi/g radium-226 plus background specified by DOE. The effectiveness of the remedial action was corroborated by verification soil sampling, near-surface gamma measurement, and exposure rate measurement. In a subsequent phase or phases, the wastes stored at the site will be removed for permanent disposal and the entire property decontaminated and decommissioned for unrestricted use.

30025 **(DOE/OR/20722—27-Vol.3) Phase II remedial action at the former Middlesex Sampling Plant and associated properties. Final report. Volume 3 .** (Bechtel National, Inc., Oak Ridge, TN (USA). Advanced Technology Div.). Apr 1985. Contract AC05-81OR20722. 187p. NTIS, PC A09/MF A01; 1; GPO Dep. File Number DE85009917.

Volume 3 contains two appendices: calibration of in situ gamma measurements, and measurements of radiation levels and radium-226 concentrations following remedial action.

30026 **(GAT-A—258) Nuclear criticality safety basics for personnel working with nuclear fissionable materials. Phase I.** Vausher, A.L. (Goodyear Atomic Corp., Piketon, OH (USA)). Oct 1984. Contract AC05-76OR00001. 64p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85012815.

DOE order 5480.1A, Chapter V, "Safety of Nuclear Facilities," establishes safety procedures and requirements for DOE nuclear facilities. The "Nuclear Criticality Safety Basic Program - Phase I" is documented in this report. The revised program has been developed to clearly illustrate the concept of nuclear safety and to help the individual employee incorporate safe behavior in his daily work performance. Because of this, the subject of safety has been approached through its three fundamentals: scientific basis, engineering criteria, and administrative controls. Only basics of these three elements were presented. 5 refs.

30027 **(GAT-T—3297) Upgrading auxiliary facility outleakage and combustion detection. Final project report.** Sandman, R.R. (Goodyear Atomic Corp., Piketon, OH (USA)). 20 Dec 1984. Contract AC05-76OR00001. 11p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012796.

A new GAT preventive maintenance method, IMG-104, patterned after a similar successful procedure in use at the Oak Ridge Gaseous Diffusion Plant (ORGDP), was issued 2/3/84 to improve the performance of the specially modified Pyrotronics HF/F_2 detectors used in the X-342-A HF vaporizer bay and X-344-C HF storage facilities. Detector thermal protection was added/improved to increase cold-weather sensitivity and reduce moisture absorption by the detectors' dibutylamine reagent. Other moisture problems previously experienced by the X-342-A feed vaporization facility UF_6 outleakage/combustion unmodified detectors were eliminated following replacement of the twelve "open" steam chests with two totally-enclosed autoclaves, and installation of a new out-leakage/combustion detection system. Practical alternate methods of detecting UF_6 outleakage and combustion by-products are discussed, as is substitution of the reagent used in the HF/F_2 detectors; however, no changes were recommended.

30028 (Juel—1950) **Analysis of the risk assessment of a waste repository for radioactive waste from the decommissioning of nuclear power plants.** Weil, L. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). Sep 1984. 167p. (In German). NTIS (US Sales Only), PC A08/MF A01. File Number DE85751650.

A review of decommissioning experiences and concepts is presented. The radioactive inventory of LWR of modern design at final shutdown is estimated on the basis of activation analysis and empirical data on contamination. In combination with existing types of waste packages and deposition techniques these results allow a prediction of the necessary repository volume for the decommissioning wastes in the Federal Republic of Germany. The essential element of this investigation is the development of a model for the quantitative analysis of the accident 'water intrusion' in the repository. Based on the fundamental chemical and physical processes governing nuclide migration a transport equation is obtained which can be restricted to one dimension due to the thickness and the low permeability of the geological layers above the repository. The radiological consequences are evaluated. The long-lived activation product Ni-59 turns out to be critical radionuclide. Despite a number of conservatisms in the model the evaluated doses are acceptable. The results clearly support the long term safety of the 'Konrad' mine as a low-level waste repository.

30029 (NIRS-M—41, pp 285-297) **Tritium exposure and health physics at Japan Atomic Energy Research Institute. Eighteen years of tritium exposure experiences.** Akaishi, Jun (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Mar 1982. NTIS (US Sales Only), PC A15/MF A01. File Number DE85781031. (CONF-811082—).

From Workshop on tritium radiobiology and health physics; Chiba, Japan (1 Oct 1981).

The research activity at the Tokai Research Establishment, JAERI, was started in 1958. Among many facilities at the Tokai Research Establishment, the following facilities are related to tritium exposure: tritium production laboratory, heavy water reactors JRR-2 and JRR-3, van de Graaff accelerator, and waste treatment plant. Among about 1500 radiation workers, about 200 are those handling tritium or working in tritium atmosphere. The production of tritium for nuclear fusion research and the handling of tritium in various facilities are reported. The chemical form of the handled tritium is tritiated water or tritium gas. For monitoring the work places, air flow type ionization chambers, cold trap method and adsorption method have been used. For the protection of the workers, half-face masks and the suits with full-face masks have been used. The individual routine or special monitoring of internal contamination has been carried out. Tritiated water and tritium gas are the foremost contaminative substances. However, the beta energy of tritium is very low, and the organs irradiated by tritium beta radiation are practically limited to soft tissues. Moreover, most of the tritium absorbed in bodies is eliminated fairly rapidly from the bodies, therefore the risk of tritium exposure is not very high.

30030 (NUREG—1127) **Radiation protection training at uranium hexafluoride and fuel fabrication plants.** Brodsky, A.; Soong, A.L.; Bell, J. (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Radiation Programs and Earth Sciences). May 1985. 31p. NTIS, PC A03/MF A01 - GPO. File Number TI85901534.

This report provides general information and references useful for establishing or operating radiation safety training programs in plants that manufacture nuclear fuels, or process uranium compounds that are used in the manufacture of nuclear fuels. In addition to a brief summary of the principles of effective management of radiation safety training, the report also contains an appendix that provides a comprehensive checklist of scientific, safety, and management topics, from which appropriate topics may be selected in preparing training outlines for various job categories or tasks pertaining to the uranium nuclear fuels industry. The report is designed for use by radiation safety training professionals who have the experience to utilize the report to not only select the appropriate topics, but also to tailor the specific details and depth of coverage of each training session to match both employee and management needs of a particular industrial operation. 26 refs., 3 tabs.

30031 (NUREG/CR—4203) **Calculational method for determining biological dose rates from irradiated research reactor fuel.** Schnitzler, B.G. (EG and G Idaho, Inc., Idaho Falls (USA)). Apr 1985. Contract AC07-76ID01570. 59p. (EGG—2383). NTIS, PC E05/MF A01 - GPO. File Number TI85012601.

Includes 1 sheet of 48x reduction microfiche.

This report describes a calculational method for the determination of biological dose rate from irradiated research reactor fuels. The calculational method is implemented in a computer program for quick and convenient assessment of multigroup gamma and beta dose rates resulting from an arbitrary (user-supplied) irradiation history. The FUELDR program calculates dose rates at a fixed dose point using built-in fission product impulse source functions and precalculated gamma and beta transport factors. The fixed dose point is located on the axial mid-plane at a distance of 3 ft (91.44 cm) from the fuel element. Transport factors are included for sixteen unique ^{235}U fuel types in use at thirteen nonpower reactor facilities. 16 refs., 12 tabs.

30032 **The status of the uranium mill tailings remedial actions project (UMTRAP).** Matthews, M.L. (US DOE, Uranium Mill Tailings Remedial Actions Project Office, Albuquerque, NM). pp 3-10 of Uranium Mill Tailings Management. Nelson, J.D. Fort Collins, CO; Colorado State Univ., (1982). (CONF-821209—).

From 5. annual symposium on uranium mill tailings management; Ft. Collins, CO, USA (9 Dec 1982).

In 1978, Congress enacted Public Law 95-604, the "Uranium Mill Tailings Radiation Control Act of 1978." The Act authorizes the Department of Energy to stabilize and control the tailings at designated inactive uranium mill tailings sites in a safe and environmentally acceptable manner. DOE has established the Uranium Mill Tailings Remedial Actions (UMTRA) Project Office to implement, in cooperation with the affected States, Indian tribes and owners of the sites, remedial actions at the sites. The UMTRA Project Office has initiated efforts to perform remedial actions in accordance with EPA cleanup standards.

30033 (EUR—9181) **Test of calorimetry for high burn-up plutonium.** Beets, C.; Carchon, R.; Fettweis, P. (Commission of the European Communities, Luxembourg). 1984. 41p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701521.

In recent times, the interest of applying calorimetry for safeguards purpose is steadily increasing. Calorimetric measurements have been performed on a set of high burn-up (25000 MWd/t) Pu samples, ranging in mass between 60 g and 2.5 kg Pu, distributed as PuO_2 powder embedded in stainless steel containers. The powers produced by these containers ranged between 0.8 W and 36 W. The calorimeter used was the Mound 150 type, and the isotopics and the Am content have been determined earlier by mass spectroscopy, completed with α and γ counting, and were later verified by the same methods. Watts/gram measurements were made on twelve 60 g samples of the same plutonium lot to demonstrate the Pu elemental and isotopic homogeneity, and hence, its suitability for subsequent NDA experiments. These samples were also measured in a stacked way to fill up the mass and wattage gaps between 60 g (0.8W) and 1 kg (14W). Calorimetric assay values, obtained with both isotopic measurements are discussed.

30034 (GAT-NM—119) **Control and accountancy of nuclear materials in a uranium enrichment plant.** Hurt, N.H. (Goodyear Atomic Corp., Piketon, OH (USA)). 21 May 1985. Contract AC05-76OR00001. 8p. (CONF-850556—10). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013128.

From 7. symposium on safeguards and nuclear material management; Liege, Belgium (21 May 1985).

A nuclear material control and accountancy system has been developed by Goodyear Atomic Corporation to meet safeguards and security requirements. It comprises three major elements: physical security, nuclear material control, and nuclear material accounting. This safeguards system is called Dynamic Material Control and Accountancy System (DYMCAS). The system approaches real-time computer control on a transaction-by-transaction basis.

30035 **(IAEA-TECDOC—316) IAEA Safeguards Information System (ISIS). A status report.** (International Atomic Energy Agency, Vienna (Austria)). Oct 1984. 43p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701283.

Publication of this technical document should serve for better understanding of the technical and functional features of the IAEA Safeguards Information System (ISIS) within the Agency, as well as in the National Systems of accounting for and control of nuclear material. It will also serve as a foundation for further development and improvement of the design and modifications of the Safeguards Information System and its services as a function of Safeguards implementation.

30036 **(Juel-Spez—256) Studies concerning ways of efficiency assessment of safeguard systems.** Canty, M.J.; Stein, G.; Rezniczek, A. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Programmgruppe Technik und Gesellschaft). May 1984. 49p. (In German). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751123.

The problems of assessing the efficiency of safeguards systems are analyzed by the example of the SEAM method. This method turned out to have several weak points, so that the quantification of the efficiency appears to be doubtful. An alternative method is suggested; it makes a qualitative assessment and has the following advantages; the outstanding importance of nuclear materials balancing is pointed out the efficiency of safeguards is best indicated by verifying the presence of nuclear materials instead of an indirect method recording abnormal conditions and the commotation of the term efficiency includes the ideas of partners in the safeguards agreement the logic of the safeguards system can be clearly defined, and it is not based on the analysis of subjective investigations on nuclear materials diversion.

30037 **(LA-UR—85-1649) Integrated nondestructive assay system for a new plutonium scrap recovery facility.** Baker, M. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 5p. (CONF-850556—9). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012710.

From 7. symposium on safeguards and nuclear material management; Liege, Belgium (21 May 1985).

A consortium of laboratories is collaborating with the Savannah River Plant to develop an integrated system of state-of-the-art nondestructive assay (NDA) instrumentation to provide nuclear materials accounting and process control information for a new plutonium scrap recovery facility. Individual microcomputer-based instruments report assay results to an Instrument Control Computer (ICC). The ICC, in turn, is part of a larger computer network that includes computers that perform process control and nuclear materials accounting functions. Integrated system design considerations, integral testing, and individual instrument measurement functions are discussed. 3 refs., 3 figs., 1 tab.

30038 **(LA-UR—85-1683) Feasibility study of plutonium isotopic analysis of resin beads by nondestructive gamma-ray spectroscopy.** Li, T.K. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 5p. (CONF-850556—6). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012717.

From 7. symposium on safeguards and nuclear material management; Liege, Belgium (21 May 1985).

We have initiated a feasibility study on the use of nondestructive low-energy gamma-ray spectroscopy for plutonium isotopic analysis on resin beads. Seven resin bead samples were measured, with each sample containing an average of 9 μg of plutonium; the isotopic compositions of the samples varied over a wide range. The gamma-ray spectroscopy results, obtained from 4-h counting-time measurements, were compared with mass spectrometry results. The average ratios of gamma-ray spectroscopy to mass spectrometry were 1.014 +- 0.025 for ^{238}Pu/^{239}Pu, 0.996 +- 0.018 for ^{240}Pu/^{239}Pu, and 0.980 +- 0.038 for ^{241}Pu/^{239}Pu. The rapid, automated, and accurate nondestructive isotopic analysis of resin beads may be very useful to process technicians and International Atomic Energy Agency inspectors. 3 refs., 1 fig., 3 tabs.

30039 **(LA-UR—85-1684) Simple self-multiplication correction for in-plant use.** Ensslin, N. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 7p. (CONF-850556—7). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012716.

From 7. symposium on safeguards and nuclear material management; Liege, Belgium (21 May 1985).

An improved self-multiplication correction has been derived with the help of an equation recently published by K. Boehnel. The simple correction is suitable for use with existing neutron coincidence counters if a hand calculator or minicomputer is available. Good results are obtained for in-plant materials when the contribution of neutrons from (α,n) reactions can be calculated. 17 refs.

30040 **(LA-UR—85-1685) Simulated physical inventory verification exercise at a mixed-oxide fuel fabrication facility.** Reilly, D.; Augustson, R. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 7p. (CONF-850556—8). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012715.

From 7. symposium on safeguards and nuclear material management; Liege, Belgium (21 May 1985).

A physical inventory verification (PIV) was simulated at a mixed-oxide fuel fabrication facility. Safeguards inspectors from the International Atomic Energy Agency (IAEA) conducted the PIV exercise to test inspection procedures under "realistic but relaxed" conditions. Nondestructive assay instrumentation was used to verify the plutonium content of samples covering the range of material types from input powders to final fuel assemblies. This paper describes the activities included in the exercise and discusses the results obtained. 5 refs., 1 fig., 6 tabs.

30041 **(LA-UR—85-1705) Effect of pulsed-column-inventory uncertainty on dynamic materials accounting.** Ostenak, C.A. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 15p. (CONF-8505139—3). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012714.

From 9. annual actinide separations workshop; Richland, WA, USA (22 May 1985).

Reprocessing plants worldwide use the Purex solvent-extraction process and pulsed-column contactors to separate and purify uranium and plutonium from spent nuclear fuels. The importance of contactor in-process inventory to dynamic materials accounting in reprocessing plants is illustrated using the Allied-General Nuclear Services Plutonium Purification Process (PPP) of the now decommissioned Barnwell Nuclear Fuels Plant. This study shows that (1) good estimates of column inventory are essential for detecting short-term losses of in-process materials, but that (2) input-output (transfer) measurement correlations limit the accounting sensitivity for longer accounting periods ($\geqq$ 1 wk for the PPP). 6 refs., 2 figs., 3 tabs.

30042 **(NUREG—0525-Rev.10) Safeguards Summary Event List (SSEL). Pre-NRC through December 31, 1984. Revision 10.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Material Safety and Safeguards). May 1985. 57p. NTIS, PC A04/MF A01 - GPO. File Number TI85901517.

The Safeguards Summary Event List (SSEL) provides brief summaries of several hundred safeguards-related events involving nuclear material or facilities regulated by the US Nuclear Regulatory Commission (NRC). Events are described under the categories of bomb-related, intrusion, missing and/or allegedly stolen, transportation, tampering/vandalism, arson, firearms, radiological sabotage, non-radiological sabotage and miscellaneous. The information contained in the event descriptions in derived primarily from official NRC reporting channels.

30043 (PNL-SA—12710) **Design features for enhancing international safeguards of AFR dry storage for spent LWR fuel.** Roberts, F.P.; Harms, N.L. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 8p. (CONF-850556—3). NTIS, PC A02/MF A01 - GPO. File Number TI85012446.

From 7. symposium on safeguards and nuclear material management; Liege, Belgium (21 May 1985).

The Pacific Northwest Laboratory has performed a study for the Nuclear Regulatory Commission to identify and analyze design features that can facilitate the implementation of IAEA safeguards at facilities for dry storage of light water reactor spent fuels. Specific design features are identified that can enhance nuclear material flow and inventory verification. These are assessed from the viewpoint of safeguards effectiveness and possible impacts on the IAEA and the operator of the AFR facility. 11 refs., 3 figs., 2 tabs.

30044 (RFP—3780) **Measurement control for plutonium isotopic measurements using gamma-ray spectrometry.** Fleissner, J.G. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 10 May 1985. Contract AC04-76DP03533. 12p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85013394.

A measurement control (MC) program should be an integral part of every nondestructive assay measurement system used for the assay of special nuclear materials. This report describes an MC program for plutonium isotopic composition measurements using high-resolution gamma-ray spectroscopy. This MC program emphasizes the standardization of data collection procedures along with the implementation of internal and external measurement control checks to provide the requisite measurement quality assurance. This report also describes the implementation of the MC program in the isotopic analysis code GRPAUT. Recommendations are given concerning the importance and frequency of the various MC checks in order to ensure a successful implementation of the MC procedures for the user's application.

30045 (UCRL—15664) **Inspection guide for vulnerability analysis of nuclear sites against outsider threats.** Harris, L. (Science Applications International Corp., La Jolla, CA (USA)). 17 Apr 1984. Contract W-7405-ENG-48. 29p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012584.

Issuance of the DOE generic threat guidance has resulted in a need for safeguards and security managers to plan and implement measures which provide protection against a range of potential threats. A necessary tool for those who plan and implement such protective measures, as well as those who inspect and evaluate these activities, is a "yardstick" to measure how well the overall system provides protection against these threats. This guide presents a systematic, common-sense, inspection method, based on vulnerability analysis, for evaluating the effectiveness of security at DOE nuclear sites against outsider threats. Application of an effectiveness evaluation method is useful, perhaps essential, for determining if the balance or mix among a site's security measures which provide access control, intrusion detection, access delay, alarm assessment, communication, protective force response, etc. is appropriate. This guide tells how a vulnerability inspection can be performed at a DOE nuclear site by two or three inspectors during a four- or five-day period. At most sites, more personnel and more time can be used productively when available. The evaluation also benefits when protective force exercises are performed as part of the inspection. The guide contains sections describing the inspection method and inspection planning. 6 refs., 6 tables.

30046 (AECL—7547) **Future trends in heavy water production.** Galley, M.R. (Atomic Energy of Canada Ltd., Sheridan Park, Ontario. CANDU Operations). Oct 1983. 25p. (CONF-830934—2). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701479.

From 4. Pacific Basin nuclear conference; Vancouver, Canada (11 Sep 1983).

World heavy water production has spanned nearly fifty years and, for much of that period, the commodity was often in short supply, but that situation has changed, at least in Canada. There are now adequate reserves of heavy water and sufficient installed production capacity to service Canadian domestic and export demands for the next ten years or beyond. More than 90 percent of the world's inventory of heavy water has been produced by the GS process but this may not be the method that is chosen when the time comes to expand heavy water production again. Other countries, such as India and Argentina, have already chosen ammonia-hydrogen exchange as an alternative technology for part of their domestic production programs. Despite the present surplus of heavy water, research and development of new technologies is very active, particularly in Canada and Japan, because it is recognized that there are still attractive opportunities for future production by processes that are both less expensive and environmentally more acceptable, than either the demonstrated GS process or ammonia-hydrogen alternative. This paper describes the prospects for some of these new processes, contrasts them with the present established methods and assesses the probable impact on the future supply situation.

30052 (DEMO—83/4G) **Flow rate measurements in the sewage pipeline of the major area of Athens.** Leontiadis, I.L.; Dimitroulas, C.P. (Democritos Nuclear Research Center, Athens (Greece)). Apr 1983. 33p. (In Greek). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701480.

Data.

Radioisotope techniques for measurement of the flow rate in the sewage central pipeline of the major area of Athens have been used and the eventual correlation of the flow rate to the sewage water level at the pipeline outlet in Keratsini coastal area has been investigated. The estimation of the flow rate by hydraulic calculations based on the sewage water level at the pipeline outlet in Keratsini coastal area was proved to be a not accurate method; this is attributed to the existing conditions at the outlet of the pipe, as well as to the extremely unstable variation rate of the flow rate. The actual relationship between the flow rate and the sewage water level at the outlet of the pipe was investigated and the inaccuracy accounted to the flow rate estimated by this relationship has been defined.

30053 (PNL-SA—12625) **Irradiation of Northwest agricultural products.** Eakin, D.E.; Tingey, G.L. (Pacific Northwest Labs., Richland, WA (USA)). Feb 1985. Contract AC06-76RL01830. 6p. (CONF-850314—67). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012455.

From Waste management '85; Tucson, AZ, USA (24 Mar 1985).

Irradiation of food for disinfestation and preservation is increasing in importance because of increasing restrictions on various chemical treatments. Irradiation treatment is of particular interest in the Northwest because of a growing supply of agricultural products and the need to develop new export markets. Several products have, or could potentially have, significant export markets if stringent insect control procedures are developed and followed. Due to the recognized potential benefits of irradiation, Pacific Northwest Laboratory (PNL) is conducting this program to evaluate the benefits of using irradiation on Northwest agricultural products under the US Department of Energy (DOE) Defense Byproducts Production and Utilization Program. Commodities currently included in the program are cherries, apples, asparagus, spices, hay, and hides.

30054 (SAND—83-6002(1-83)) **Sealed neutron tubes foreword.** Lidin, G.; Massieux, J. Translated from *Vide, les Couches Minces ;* **37**: No. 212, vp(May-Jul 1982). Contract AC04-76DP00789. 126p. NTIS, PC A07/MF A01; 3; GPO Dep. File Number DE85005532. DE85005532

In this issue, we present: in the first three chapters, a summary of current information on neutron tubes, based on our own experience and the bibliography; and a discussion of two important problems affecting neutron tubes; high voltage breakdown along the tube acceleration path; and aging of the tritiated targets because of the natural decay of tritium into helium 3.

30055 (CONF-8411127—1) **Light your runways and taxiways without electricity.** Tompkins, J.A. (Oak Ridge National Lab., TN (USA)). 1984. Contract AC05-84OR21400. 25p. NTIS, PC A02. File Number DE85003060.

From Annual conference of the IES aviation committee; Charleston, SC, USA (13 Nov 1984).

Lights using krypton 85 were fabricated and tested as airfield-threshold markers, runway edge markers, and taxiway markers. Efforts were then turned to tritium, and the ORNL program was directed toward improvement in light output and light source design. Acquisition distances of over 4 miles were achieved by a combination of tube design, phosphor and coating techniques, quality assurance, and new tritium loading techniques. Field tests have been conducted, a rigorous safety testing and quality control program has been instituted. The dose received when light fixture breaks is analyzed. A cost breakdown is made. (DLC)

30056 (MLM—3250(OP)) **Forming of metal components for radioisotope heat sources.** Johnson, E.W. (Monsanto Research Corp., Miamisburg, OH (USA). Mound). 1984. Contract AC04-76DP00053. 22p. (CONF-840113—11). NTIS MF A01; 2; GPO Dep. File Number DE85011281.

From Symposium on space nuclear power systems; Albuquerque, NM, USA (10 Jan 1984).

Flight-quality iridium components can be fabricated from iridium alloys by modifying standard production processes. A large quantity of metrological and NDE data support the quality of these devices, which, in turn, justify their use in containing plutonium fuel for space system applications.

08 HYDROGEN

0801 Production

REFER ALSO TO CITATION(S) 30198

30057 (INIS-mf—9297) **Catalysis of photochemical hydrogen production by metal dithiolenes in aqueous organic solvents.** Zeug, N. (Dortmund Univ. (Germany, F.R.). Abt. Chemie). 27 May 1983. 213p. (In German). NTIS (US Sales Only), PC A10/MF A01. File Number DE85780929.

Photolysis(lambda>=248 nm) of zinc ditetrabutylammonium-bis(cis-1,2-dicyano-1,2-dithiol-ethylene) in mixtures of water with 2,5-dihydrofuran (2,5-DHF) or tetrahydroguran (THF) gives rise to catalytic production of hydrogen. The mechanisms of this process were studied here. The photochemical and thermal properties of zinc dithiolene were studied along with the analogous cadmium and mercury complexes. It could be shown that zinc dithiolene is in fact only the precursor to the actual catalyst which has been identified elsewhere as zinc sulphide. (orig./GG).

30058 **Interfacing the tandem mirror fusion reactor to a hydrogen thermochemical plant.** Hoffman, M.A.; Rowe, D.S. (Lawrence Livermore National Laboratory, Livermore, California). *Nuclear Technology/Fusion;* **6**: No. 2 PT. 1, 288-304(Sep 1984).

Using energy from a fusion reactor to produce such synfuels as hydrogen is a challenging goal because of the special thermal requirements imposed on the blanket design. The interfacing of the tandem mirror reactor to the General Atomic thermochemical process (TCP) for hydrogen production considering two types of interfacing approaches is investigated. The first uses electrical energy to joule heat a high-temperature part of the TCP and can have an overall plant efficiency of about 30 to 36%. The second approach uses hightemperature thermal energy to heat the hightemperature part of the TCP and has an overall plant efficiency of 43%. The trade-off between these two approaches involves consideration of overall plant efficiency versus the feasibility of developing a costeffective, high-temperature blanket and heat transport system for long lifetime and high reliability.

30059 **Catalyzed photodissociation of water.** Somorjai, G.A.; Hendewerk, M.; Turner, J.E. (Lawrence Berkeley Lab., CA). *Catalysis Reviews;* **26**: 683-708(Aug-Dec 1984). Contract AC03-76SF00098.

The photoelectrochemical dissociation of water is reviewed. Two different configurations - the $SrTiO_3$/Pt/KOH semiconductor metal system and the n-type/p-type iron oxide photoelectrochemical diode are considered. Both have been shown to drive the water splitting photochemical reaction without an external potential. The $SrTiO_3$-based system requires illumination by light in the near-UV region (H Nu ≧ 3.1 eV), while the iron oxide system can operate with light in the visible region (h Nu ≧ 2.3 eV). The discussion of these two systems for water dissociation demonstrates the accomplishments and difficulties of research in this field of inorganic photosynthesis. 7 references, 21 figures, 1 table.

0802 Storage

REFER ALSO TO CITATION(S) 31050

30060 **Electrochemical investigation of hydrogen storage in metal hydrides.** Luedecke, C.M.; Deublein, G.; Huggins, R.A. (Stanford Univ., CA). *Journal of the Electrochemical Society;* **132**: 52-56(Jan 1985).

One of the problems regarding the use of hydrogen as an energy carrier is related to storage. One approach for a solution is related to the use of solid metal hydrides. Many studies regarding the formation of metal hydrides have included the conduction of absorption experiments in which hydrogen from the gas phase reacts with solid alloys. However, electrochemical methods provide another approach for the study of metal hydrides. Thus, measurements can be conducted under isothermal conditions by applying an electrical potential, rather than changing the pressure and/or the temperature. Certain difficulties related to a use of aqueous electrolytes can be avoided by using nonaqueous electrolytes. In the present investigation, NaH dissolved in a low temperature molten salt is used as the electrolyte. The hydrogen transmitting species in this case are not H(+) ions, but H(-) ions. A new theoretical approach is also discussed and applied, together with the considered experimental method, to three systems. These systems include Mg-Ni-H, Mg-Cu-H, and Mg-Al-H. 29 references.

30061 (NP—5770191, pp 4.1-4.15) **Hydrogen in future energy supplies.** Vigeholm, B. Jan 1984. (In Danish). NTIS (US Sales Only), PC A16/MF A01. File Number DE85770191.

EFP-81.

In Technological development and its impact on the future energy system. Appendix 1. Evaluation commissioned by the Danish Ministry of Energy.

Hydrogen is probably the best future energy carrier, effectively stored, transferred and converted into the required applied form. Hydrogen production based at present on the expensive steam reforming processes has to be developed by other methods, if hydrogen is to play essential role in the future energy supply. On the other hand the environmental aspects are very much in favor of this very clean energy source.

30062 **(AFEE—66-330207) Methane fermentation of agricultural residues. Utilization in farming.** Beaumond, N. (Ecole Nationale Veterinaire de Lyon, 69 (France)). 1980. 51p. (In French). NTIS (US Sales Only), PC A04. File Number DE85751225.

The application of methane fermentation to the conversion of agricultural residues into energy is studied, with emphasis on biogas technology. The advantages of this process in farming and specially in bigger farms are described. They are as follows: diminution of environmental pollution; use of fermentation residues as fertilizers; as animal feeds; sanitary utility of methane fermentation for pathogen destruction.

30063 **(BNL—36366) Flash hydropyrolysis and methanolysis of biomass with hydrogen and methane.** Steinberg, M. (Brookhaven National Lab., Upton, NY (USA)). Apr 1985. Contract AC02-76CH00016. 28p. (CONF-850512—2). NTIS, PC A03/MF A01; GPO Dep. File Number DE85013291.

From Beijing international symposium on hydrogen systems; Beijing, China (7 May 1985).

The process chemistry of the flash pyrolysis of biomass (wood) with the reactive gases, H_2 and CH_4 and with the non-reactive gases He and N_2 is being determined in a 1 in. downflow tubular reactor at pressures from 20 to 1000 psi and temperatures from 600 to 1000°C. With hydrogen, flash hydropyrolysis leads to high yields of methane and CO which can be used for SNG and methanol fuel production. With methane, flash methanolysis leads to high yields of ethylene, benzene and CO which can be used for the production of valuable chemical feedstocks and methanol transportation fuel. At reactor conditions of 50 psi and 1000°C and approximately 1 sec residence time, the yields based on pine wood carbon conversion are up to 30% for ethylene, 25% for benzene, and 45% for CO, indicating that over 90% of the carbon in pine is converted to valuable products. Pine wood produces higher yields of hydrocarbon products than Douglas fir wood; the yield of ethylene is 2.3 times higher with methane than with helium or nitrogen, and for pine, the ratio is 7.5 times higher. The mechanism appears to be a free radical reaction between CH_4 and the pyrolyzed wood. There appears to be no net production or consumption of methane. A preliminary process design and analysis indicates an economically competitive system for the production of ethylene, benzene and methanol based on the methanolysis of wood. 8 refs., 18 figs., 1 tab.

30064 **(DGRST—79-7-1290) Methane production from cellulosic wastes: kinetic studies.** Goma, G.; De La Torre, I.; Maugheri, F.; Yameogo, T. (Delegation Generale a la Recherche Scientifique et Technique (DGRST), 75 - Paris (France)). Sep 1979. 52p. (In French). NTIS (US Sales Only), PC A04/MF A01. File Number DE85751220.

The anaerobic fermentation is studied on lignocellulosic materials and sucrose as substrate. With the lignocellulosic material cellulolysis is rate limiting. The reducing sugar concentration in the fermentation broth is less than 15 mgl^{-1}. With rumen bacteria, 50% of the initial polyoside are used and 12% of the lignin is solubilized. With sucrose studies on the kinetic behaviour of the mixed population responsible of the acidogenesis step permite to find the optimal temperature (40°C) feed substrate concentration (50 gl^{-1}) residence time (60 hours) and pH (5,5 - 6). The better technology is a plug flow fermentor with cell recycling. Modeling of the behaviour of this reactor was performed. The use of this reactor for the selection of acido resistant bacteria is discussed. For methanogenesis, in continuous culture, the ideal technology seems to be an association of two reactors. In the first step, a plug flow reactor must be used for acidogenesis, and in the second step a well mixed reactor permit the conversion of organic acids in methane.

30065 (DOE/ER/10345—T1) Mechanistic studies of carbon monoxide reduction. Final technical report. Geoffroy, G.L. (Pennsylvania State Univ., University Park (USA). Dept. of Chemistry). 1984. Contract AC02-79ER10345. 20p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85004305.

The major aim of nearly all synthesis gas research involves the development of more active and selective catalysts. One way to approach catalyst development is through mechanistic studies whereby an understanding of the mechanistic course of the reaction should allow the design of more efficient catalysts. It is the major aim of this research program to contribute to that mechanistic understanding. Two approaches will be employed in this research. First, certain aspects of the mechanism of the heterogeneous metal surface catalyzed reduction of CO will be probed using transition metal cluster complexes to model the chemistry of metal surfaces. Secondly, we will address various aspects of the mechanism of homogeneous CO reduction by focusing on a few key mechanistic steps, particularly halide-promoted reactions and the formation, stabilization, and reactivity of formyl, acyl, methylene, and ketene ligands. Some exploratory work is also proposed involving studies of the adsorbed state of simple unsaturated molecules on metal surfaces using solid-state ^{13}C NMR spectroscopy, as well as reactions which model non-synthesis gas chemistry of metal surfaces. 39 refs., 7 figs., 1 tab.

30066 (DOE/PC/30228—T10) New catalysts for the indirect liquefaction of coal. First quarterly technical report, August 1-October 31, 1981. Melson, G.A. (Virginia Commonwealth Univ., Richmond (USA). Dept. of Chemistry). 1981. Contract FG22-80PC30228. 4p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013156.

During the first three months of the second year of support under grant No. FG22-80PC30228 work has concentrated on the evaluation of the catalytic ability of some iron/zeolite catalysts for synthesis gas conversion. The catalysts were prepared from $Fe_3(CO)_{12}$ and the zeolite support 13X by methods previously reported or from $Fe(NO_3)_3$ x 9 H_2O and the support by the incipient wetness technique. All catalysts have been evaluated using a synthesis gas mixture of H_2:CO, 1:1 at 300 psig and at 280° and 300°C with a Chemical Data Systems Series 804 CF-HP microreactor. Effluent gases and liquid products have been analyzed by techniques described in previous reports. Each catalyst was evaluated for a period of 2 to 3 weeks. The catalytic data obtained are presented. 1 tab.

30067 (DOE/PC/50804—9) CO + H_2 reaction over nitrogen-modified iron catalysts. Quarterly technical progress report, October 1, 1984-December 31, 1984. Delgass, W.N. (Purdue Univ., Lafayette, IN (USA). School of Chemical Engineering). 1985. Contract FG22-82PC50804. 25p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013791.

Preoxidizing a freshly prepared zeta-Fe_2N catalyst resulted in unique Fischer-Tropsch behavior. Characterization of this catalyst by Moessbauer spectroscopy indicated contributions from both zeta-Fe_2N and Fe_3O_4. The kinetic behavior of this preoxidized catalyst revealed a remarkable enhancement in the C_4 and C_5 hydrocarbons as compared to the kinetics over the zeta nitride. Transient kinetic studies by mass spectrometry determined the bulk stoichiometry of a prenitrided catalyst after 12 hours of reaction in 3/1 H_2/CO at 523 K by monitoring the H_2O, NH_3 and CH_4 produced during temperature programmed reduction in H_2. The ϵ-Fe/sub 2.7/N catalyst lost 24% of its nitrogen. The zeta-Fe_2N catalyst lost 15% of its nitrogen. 14 refs., 3 figs., 2 tabs.

30068 (DOE/PC/50810—T10) Promotion effects on the synthesis of higher alcohols. 11th quarterly report, January-March 1985. Goodwin, J.G. Jr.; Chuang, S.C. (Pittsburgh Univ., PA (USA). Dept. of Chemical and Petroleum Engineering). Apr 1985. Contract FG22-82PC50810. 30p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85011001.

In order to gain a better understanding of the mechanism of CO hydrogenation, we have studied Ni/SiO_2 (a methanation catalyst), Ru/SiO_2 (a higher hydrocarbon synthesis catalyst), Rh/SiO_2 (a synthesis catalyst with high selectivity for C_2 oxygenates), and Pd/SiO_2 (a methanol synthesis catalyst) by the addition of probe molecules to CO/H_2 under synthesis conditions. Ethylene, ethanol, and acetaldehyde were utilized as probe molecules in this study. The addition of ethylene can produce hydrocarbon intermediates, and the addition of ethanol and acetaldehyde may lead to oxygen-containing intermediates. These intermediates may be similar to those produced by Fischer-Tropsch (F-T) synthesis. The addition of such probe molecules, however, could have a great effect on the overall product distribution. The possible reactions due to the addition of these probe molecules are summarized in Table I-III. By determining the ability of a catalyst to catalyze these specific reaction steps, the reaction paths for the formation of hydrocarbons and oxygenates on these metal catalysts may be clarified. 49 refs., 1 fig., 9 tabs.

30069 (DOE/R2/05003—T1) Production of a usable energy source by anaerobic digestion of rum waste. Erdman, M.D. (Puerto Rico Univ., San Juan. Center for Energy and Environment Research). 1975. Contract FG42-79R205003. 14p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012216.

A 10-liter anaerobic fermentor was constructed from plastic (PVC) and glass tubing, stainless steel turnings, steel couplers and valves. The fermentor consisted to two parallel cylinders which were connected at top and bottom. The fermentor system was also equipped with hydraulic agitation, pH measuring, controlling and recording capabilities, temperature recorder, plug or continuous flow fermentation capabilities, sample ports and a wet test gas meter. The fermentor was inoculated with 9.5-liters primary sewage sludge and plug fed 0.5-liter of rum waste daily for 48 days. The pH remained at 6.8 and temperature was 27.9 +- 0.16°C throughout the fermentation. Rum waste, anaerobically fermented at a 10 day hydraulic retention time produced 1.93-liters of biogas at standard conditions/liter of rum waste. The biological oxygen demand of unfermented and fermented rum waste were 35135 and 25000 mg/1, respectively. Total solids level of rum waste influent and effluent were 75992 and 61392 mg/1, respectively. 1 ref., 3 figs., 1 tab.

30070 (DOE/R3/02456—T1) Integrated renewable energy/organic waste recycling system. Final report, July 31, 1982. Hamburg, R.A.; Davenport, S. (Hamburg (Robert A.), Orma, WV (USA)). 1982. Contract FG43-80R302456. 81p. NTIS MF A01; 2; GPO Dep. File Number DE85009329.

Two operating systems for integrated recycling of organic materials are described. The systems include Chinese water-pressure design biogas digesters/solar greenhouses/and algae and aquatic plant ponds-all in passive symbiotic relationships with a minimum of technological sophistication. Economic, Financial and Net Energy Analyses of these systems have been done with concern toward long term environmental effects. A discussion of fish ponds and fuel alcohol production is also included since they offer much potential for expanded integration. 21 tabs.

30071 (DOE/SF/01985—T1) Biogas energy for Hawaiian small farms and homesteads, HI-11. Final report. Weitzenhoff, M.H. (Weitzenhoff (Michael H.), Honolulu, HI (USA)). Feb 1980. Contract FG03-78SF01985. 83p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85012218.

This report contains the results of a US Department of Energy, Appropriate Energy Technology grant for the development and demonstration of a simple, easy-to-operate and high energy yielding anaerobic bioconversion system for Hawaiian small scale hog farms. The system included a flexible material "rubber" digester, gas storage tank, algae pond, wastewater recycling loop, and gas utilization appliances. Ten cubic feet of biogas per 150 pound hog per day was identified as the sustainable yield of biogas using this system under Hawaiian farm conditions at a 15-day retention period without heating or mixing the anaerobic digester. Cost of the system was compared with the economic value of the gas produced and the investment recovery period was found to be 1.16 years. Biogas was used to fuel numerous farm appliances, including nursery infra-red heaters, gas lamps and an internal combustion powered water pump. Digested pig manure was renovated by recycling through an algae pond, after which it was used in biweekly hog housing sanitation washdowns. Finally, the results of the project have been promulgated through informal seminars, workshops, and the publication-distribution of a farmer oriented manual on digester installation and operation. 6 refs., 14 figs., 1 tab.

30072 **(FRNC-TH—1620) Simulations of the kinetics of large wood particle pyrolysis and of material balance of pure oxygen gasification.** Belleville, P. (Universite de Technologie de Compiegne, 60 (France)). Dec 1982. 154p. (In French). NTIS (US Sales Only), PC A08. File Number DE85751351.

The different processes and apparatus involved in gasification of heat transfer problems, of wood pyrolysis kinetics, and of the composition of gasification products are reviewed. The pyrolysis of large wood particles and setting up of a heat transfer model allowing the simulation of wood pyrolysis kinetics are studied experimentally. Results obtained during a series of trials conducted on an oxygen fluidized bed gasification pilot plant are given.

30073 **(FRNC-TH—1898) Methane fermentation of substrate mixtures. Kinetic and microbiological aspects.** Petroff, D. (Ecole Nationale Veterinaire de Lyon, 69 (France)). 1983. 279p. (In French). NTIS (US Sales Only), PC A13/MF A01. File Number DE85751223.

A single-stage digestion study of the mesophilic and thermophilic anaerobic digestion of four mixtures prepared from residual sludge, algae, brewery draff and household refuse, was carried out. Isolation and characterization of methanogenic bacteria that use acetate was performed.

30074 **(FRNC-TH—1969) Biomass thermochemical liquefaction.** Esnouf, C. (Ecole Nationale Superieure de Chimie, 75 - Paris (France)). Apr 1984. 363p. (In French). NTIS (US Sales Only), PC A16/MF A01. File Number DE85751592.

The bulk of research carried out for producing liquid fuels (including engine fuel) through direct thermochemical routes, has been analyzed, except for conventional acid hydrolysis. The more detailed researches have been taken into special consideration, such as the alkaline CO-steam process which has lead to a process Development unit at Albany (USA). The process has been analyzed and we have identified the reasons for its failure. We tried to build a complete chemical reactional mechanism for biomass components under liquefaction conditions, and we found promising tracks for research. (An experimental program has been proposed in a field not yet studied). So we assessed the potentials of liquefaction. In order to test a large range of reactions, at a proper scale, we have developed a 15 liters reactor, which can process 2 Kg wood up to 450°C and 300 bars, and under corrosion conditions occasionally severe. Considering the importance of kinetic parameters, the reactor has been designed to give a very short heating time (15 minutes up to 350°C now, less than 2 minutes with a small alteration), while keeping an easy running and a maximum security.

30075 **Surface science and catalysis.** Somorjai, G.A. (Univ. of California, Berkeley). *Science (Washington, D.C.);* **227**: 902-908(22 Feb 1985). Contract AC03-76SF00098.

During the last 20 years, surface scientists have developed a variety of techniques that make it possible to study, on the molecular level, the structure, composition, and chemical bonding in the surface monolayer. Both single-crystal model catalysts and real catalyst systems that are active in important chemical processes have been investigated by a combination of ultrahigh-vacuum surface science techniques and high-pressure kinetic techniques in an effort to determine the relation between the structure and composition of the surface and the rates of reaction and selectivities. The structure of the atomic surface, a strongly adsorbed overlayer, and the oxidation states of surface atoms are the important molecular features of an active catalyst. As a consequence of modern surface science, the design and preparation of catalysts has developed from an art into a high technology.

30076 **Chemical kinetic modeling of hydrocarbon combustion.** Westbrook, C.K.; Dryer, F.L. (Lawrence Livermore National Lab., CA). *Progress in Energy and Combustion Science;* **10**: No. 1, 1-57(1984).

A review of high-temperature hydrocarbon oxidation in combustion systems discusses the reaction mechanisms for specific fuels - from hydrogen to n-butane - emphasizing the hierarchical structure of the mechanisms for complex fuels in order to develop the concept of a comprehensive mechanism. In relating kinetic models to real combustion systems, the study begins with purely kinetic thermodynamic applications that neglect transport effects such as diffusion of heat and mass (as in shock tubes, detonations, plug flow reactors, and stirred reactors). It then describes laminar flames, the coupling between diffusive transport and chemical kinetics, and applying laminar flame models to practical combustion problems.

0902 Alcohol Fuels

30077 **(FRNC-TH—1752) Immobilized yeasts: growth and metabolism, alcohol fermentation.** Navarro, J.M. (Toulouse-3 Univ., 31 (France)). Jun 1980. 128p. (In French). NTIS (US Sales Only), PC A07. File Number DE85751226.

The reaction characteristics of Saccharomyces uvarum immobilized in solid supports are presented. Two types of solid supports are used, porous brick and porous silica. Yeast adsorption and covalent coupling, influence of pore size on adsorption are evaluated. The effects of immobilization on growth and metabolic activity (CO^2 and ethanol production rate) of Saccharomyces uvarum are described.

30078 **(FRNC-TH—1753) Continuous ethanol production with yeasts adsorbed on a solid support.** Ryu, Y.W. (Institut National des Sciences Appliquees (INSA), 31 - Toulouse (France)). Jul 1980. 81p. (In French). NTIS (US Sales Only), PC A04. File Number DE85751227.

Continuous ethanol fermentation is carried out with Saccharomyces Cerevisiae, immobilized on various solid supports, in a tubular reactor and in a gradostat. The five following supports are investigated: biodamine (porous ceramics, wood shavings, PVC, corn cob, silica). The retention capacities of these supports concerning Saccharomyces cerevisiae and the production rate of ethanol are evaluated. The adsorption of Saccharomyces cerevisiae on wood shavings, which seems to be the most efficient support, is particularly studied.

30079 **(FRNC-TH—1871) Alcohol fermentation: study in continuous culture of the effect of temperature and antibiotics in a multi-stage reactor.** De Albuquerque, A.U. (Toulouse-3 Univ., 31 (France)). 1982. 12p. (In French). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751222.

A study in a multi-stage reactor of the continuous fermentation of glucose by Saccharomyces bayanus, was carried out. The following topics were successively described: influence of antibiotics on the yeast ethanol tolerance; effect of temperature; nature of the mechanism of inhibition by ethanol; effect of variation of the glucose load by modifying the flow rate and initial concentration; modelisation of the fermentation kinetics; assessment of the fraction of ethanol produced by non-proliferating cells.

30080 **Over-production of cellulase - screening and selection.** Cuskey, S.M.; Frein, E.M.; Montenecourt, B.S.; Eveleigh, D.E. New Brunswick, NJ; Rutgers University (1982). 11p. Contract AC02-83ER13106.

In order to enhance and facilitate enzymatic hydrolysis of cellulose, a program has been initiated to increase the yields of cellulase, and to obtain enzymes with greater specific activities. An attempt has also been made to obtain enzymes that are less subject to end-product inhibition. Investigations have been concerned with gaining mutants with more effective β-glucosidase and also immobilizing cells in order to effect greater cellulase productivity.

0904 Solid Waste And Wood Fuels

REFER ALSO TO CITATION(S) 30504

30081 **(CR—84-031) Evaluation of HRI facilities at NS Mayport and NAS Jacksonville, Florida - lessons learned report [heat recovery facility]. Final report.** Frounfelker, R.; Belencan, H. (Systech Corp., Xenia, OH (USA)). Jul 1984. 168p. Naval Civil Engineering Lab., Port Hueneme, CA 93043. File Number TI85901463.

The Naval Station (NS) Mayport and Naval Air Station (NAS), Jacksonville, Florida, heat recovery incinerator (HRI) facilities employ two different technological approaches to perform the twofold task of base-generated waste disposal and energy recovery. The NS Mayport HRI utilizes a single 50-ton per day (TPD) field-erected, excess-air, grate incinerator to mass burn the as-received waste. A pit/crane is used to store and retrieve the waste. The NAS Jacksonville HRI utilizes three 24-TPD modular starved-air, refractory hearth incinerators to burn a refuse-derived fuel (RDF) waste. The RDF processing system is located on site, and a live-bottom bin is employed for storage and retrieval of the RDF. The NS Mayport HRI is operational and burns an average of 1.25 tons/hr (TPH) of solid waste 4 to 5 days/wk. The NAS Jacksonville HRI is not operational and has been closed since June 1983. The objective of this report is to evaluate and compare the performance of these two concepts and to make recommendations concerning future applications within the Navy Shore establishment. In addition, the report defines the lessons learned from the design, construction, and operation of these two facilities. To meet these objectives, the feasibility studies, design documents, and operational data from the two HRI facilities were reviewed. Additional information was obtained from site visits and discussions with facility operators and personnel associated with the various phases of these two projects. 25 refs., 28 figs., 16 tabs.

30082 **(ERG-MR—4e) Alternative liquid fuels.** Overend, R.P.; Moo-Young, M.; Robinson, C.W.; Lencki, R. (Energy Research Group, Ottawa (Canada)). Jun 1984. 34p. Energy Research Group, P.O. Box 8500, Ottawa K1G 3H9, Canada. File Number TI85901443.

This report contains 2 papers which were presented at the Energy Research Priority Seminar in Ottawa on August 9, 1983. Both papers address biomass conversion to energy. The first paper discusses the status, economics and net energy of biomass combustion, gasification, syngas, direct liquefaction, anaerobic digestion, and fermentation processes. An extremely large range of technologies is available for biomass conversion, and the available systems cover a large range of scales and technical maturities. Energy balance and economics favor the direct combustion of biomass for process heat and space-conditioning applications. Where the local demand requires conversion to electricity or liquid fuels, the energy and economic penalties are severe and are a barrier to implementation. The second paper compares alternative feedstocks for ethanol and methanol production. The economics of using corn, wood, wastes, sugar cane, and algae are considered.

30083 **(FRNC-TH—1900) Energetic beneficiation of biomass: designing a high-density straw press with oscillating elements.** Drouin, B. (Ecole Nationale Superieure des Arts et Metiers, 75 - Paris (France)). 1981. 2p. (In French). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751224.

The study deals, on the one hand, with the design of a straw press containing heavy components (800 kg) oscillating at high frequency (1 to 2 Hertz), on the other hand, with the description of a special process for maintaining an oscillatory motion and its application to the prototype constructed.

30084 **(PB—85-168839/XAB) Wood residue value at the heating plant - a comparison with oil.** Thoernqvist, T. (Sveriges Lantbruksuniversitet, Uppsala. Institutionen foer Virkeslaera). 1983. 57p. (In Swedish). (REPT—139). NTIS, PC E04/MF E01.

A study was made of those factors that influence a heating plant's ability to pay for wood residues, compared with oil. The information base for the analysis is from the answers obtained from questionaires sent to five heating plants (in Sweden). The analysis is directed towards the additional cost of solid-fuel-fired heating plants as compared to oil firing.

30085 **(SNV-PM—1713) Firing fast fuels on a small scale in densely built areas. Basic document.** Bernegaard, L.; Hindrum, K.; Lindau, L. (Statens Natuurvaardsverk, Solna (Sweden)). Sep 1983. 152p. (In Swedish). NTIS (US Sales Only), PC A08. File Number DE85750842.

The aim of this report is to present the background data of the proposal for general recommendations concerning firing procedures in densely built areas. The use of wood fuel has started to increase again since the small houses have been furnished with stoves as complementary heating equipment. While the use of solid fuels has increased, the complaints about pollution and troubles in respiratory organs to the authorities have increased as well. Firewood is predominant, and chips, pellets and waste fuels have become available, the latter fuel type being inconvenient. The boilers in general have a magazine, they are top fired with a water cooled firing chamber. The combustion temperature seldom exceeds 800 C degrees so that all gases will not be ignited. New furnace designs are being introduced, having inverse combustion and ceramic after-burners. Stoves are being developed to improved insulation and combustion. Low emissions of carbon oxides, particulates and organic substances, e.g. 2 mg tar per MJ can be obtained by suitable designs. When using individual houses, a long-time average value of dilution factor of 8000 can be calculated for the gases at a distance to 40 m. Studies of wood firing in minor settlements show increasing emission of organic substances, even if only 10 percent of energy supply is coming from wood.

30086 **(STEV-SB—83-26) Drying of wood chips for fuel. Full scale tests and dryer designs.** Svensson, L. (Statens Energiverk, Stockholm (Sweden)). Feb 1983. 103p. (In Swedish). (SLU-LBT—126). NTIS (US Sales Only), PC A06. File Number DE85750866.

In this report the possibilities of artificial drying of fuel chips with air, with or without additional heating is illustrated. The report may function as a dimensioning basis then construction dryer set-ups. By drying fuel chips you obtain a number of advantages at the continued handling. These advantages are summarized below: Increased heating value, Reduced fungal growth, Lower dry substance loss at storing, Lower emission of organic compounds at combustion, Less damage on building materials at storing. It is important that the fuel chips are dryed to a low moisture content as soon as possible after chipping. Measurements of the fungal growth show that the longest acceptable time of drying down to 20 percent moisture content, is 15 days. In the project the basic conditions of dimensioning a dryer has been designed. The basic data are: The pressure drop of the air passing over the fuel chips. The water absorption of the air. Degree of vapor saturation of the outgoing air. The effect of additional heating on the drying speed. When drying wood chips with cold air during summer there is good chance of obtaining a positive energy balance. The report also mentions examples of various designs for dryers, and in appendix 1 and 2 two full-scale tests are described.

30087 **Georgia wood energy research and development project.** Bulpitt, W.S.; McGowan, T.F. (Georgia Inst. of Tech., Atlanta). pp 435-441 of Proceedings of industrial wood energy forum '82. Vol. II. Madison, WI; Forest Products Research Society (1983). (CONF-820341—).

From Industrial wood energy forum; Washington, DC, USA (8 Mar 1982).

In 1979 a grant was awarded to the Georgia Office of Energy Resources (OER) by the Biomass Energy Systems Division of the U.S. Department of Energy for the purpose of exploring many issues related to furthering the use of wood energy in an industrial regime, with particular emphasis placed on the use of wood by non-forest products industries. The Engineering Experiment Station at Georgia Tech. was selected as the prime contractor to perform the bulk of the work. This paper will briefly describe the highlights of this program as will the presentation included in the Technical Forum Session at the 1982 6th Industrial Wood Energy Forum.

13 HYDRO ENERGY

30088 (CONF-7907129—, pp 95-108) **Selected bibliography of literature on small-scale hydroelectric.** Master, D.B. (Univ. of California, Los Angeles). May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

A bibliography on small-scale hydroelectric power development is presented. The bibliography, containing 102 references, is divided into the following sections: engineering and technology; economics and utility interface; regulation, institutional barriers, and government policy; environment; and general.

30089 (NP—5901441) **Renewable energy: hydropower.** (Florida Governor's Energy Office, Tallahassee (USA)). Apr 1985. 20p. NTIS, PC A02/MF A01. File Number DE85901441.

In Florida, hydropower will continue to supply some baseload electrical capacity using existing facilities such as Jim Woodruff Dam. New hydro facilities may meet local needs in some cases, such as in Tallahassee and Leesburg. However, hydropower is not expected to make important contributions to Florida's energy needs largely because of the state's flat topography. The use of hydro for generating peaking electric power is technically and environmentally undesirable in Florida since lakes have minimal storage capacity and water fluctuations have adverse effects on fish and wildlife as well as water quality. Limited potential may exist for small hydro installations to serve local and individual needs at existing dams in Florida. Nationwide, small hydro will be at a disadvantage because it will not have a dependable capacity and will have high capital costs. Small hydro will probably not off set the need to build new power plants for this reason. Advantages of reliability, efficiency, and lack of atmospheric or thermal pollution will continue to make hydropower worthy of consideration. It is possible that small hydro will be able to contribute 8000 MW to the nation's energy picture with minimal impacts on land and water resources. Large hydro projects can contribute 46,000 MW, but with potential major impacts on water resources.

1301 Resources And Availability

30090 (CONF-7907129—, pp 5-8) **General recommendation areas.** May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

A number of policy-related themes emerged out of the separate working group discussions as well as from the general sessions. These themes constitute major recommendation areas stemming from the workshop. To some extent, these areas reflect issues specific to a topic; in other cases, they cut across topical lines to emphasize a more generic consideration. In either case, they deserve close scrutiny by the spectrum of organizations, individuals, agencies, and other entities associated with various aspects of small-scale hydro development in the West.

30091 (CONF-7907129—, pp 29-30) **Summary of plenary discussion on follow-on activities to the workshop.** May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

An explicit goal of the UCLA Workshop was to explore and if possible, initiate follow-on activities for promoting small hydro development which would continue the positive momentum built up at the Kellogg West Conference Center. Thus, after the equivalent of about two days worth of very focused, topic-specific discussion in work groups, an open plenary session was held to broach the issue of follow-on. Although there was some overlay in this discussion with the subject matter of various work session, the final output was substantially more diverse. The flow of discussion in this open session did not yield a coherent set of activities and commitments which could be considered to be a follow-on program. Many ideas were suggested, but specific mechanisms were seldom agreed upon as a means to actualize them. Nonetheless, some specific commitments were made and there was a strong sense of interest and concern that is likely to be pursued by individuals through their existing associations with professional and other organizations.

30092 (CONF-7907129—, pp 31-50) **Speakers' remarks.** May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

The following speakers discussed various aspects of small-scale hydroelectric development: Ronald D. Doctor, Commissioner, California Energy Commission; Wilson Clark, Energy Advisor to the Governor of California; Ellis Armstrong, Commissioner, US Bureau of Reclamation and Chairman, US National Committee of the World Energy Conference; Claire Dedrick, California Utilities Commission; Richard McDonald, Director, Resource Applications Division, US DOE; and Eugene Neblett, Federal Energy Regulatory Commission.

30093 (CONF-7907129—, pp 91-94) **Development of small hydroelectric power in China.** Zhao-Xiang, Tu. (China National Machinery and Equipment Export Corp.). May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

The development of small hydroelectric power plants in China is discussed. China has abundant water resources. The national potential of these resources may be about 580,000 MW, of which approximately 150,000 MW are to be generated by medium and small rivers. Approximately 50% of the countries in China are reported to have hydroelectric resources with the potential capacity of 10,000 kW power supply or even higher. Therefore, long-term development of China's hydroelectric resources is one of the most effective measures in the course of China's modernization.

30094 (CONF-7907129—, pp 123-140) **Need for hydroelectric resource development in the West.** Armstrong, E.L. May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

The necessity for the development of the hydroelectric resources in the Western US is discussed. These resources must be developed because of the well-known fact that we are running out of energy. It is necessary that the energy industries and government agencies change from an era of competition and of adversary stances between industry and government to an era of complementation and cooperation if the needs of society are to be meet.

30095 (TVA/PUB—84/21a, pp 366-375) **Recommended activities in small hydropower development - Lesotho.** Jackson, B.C.; Johnson, M.L. (National Rural Cooperative Association, Washington, DC). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A two-person team spent three weeks in Lesotho under the sponsorship of USAID-ST/EY to recommend hydropower activities appropriate for the country. The team found that Lesotho has the physical features appropriate for large hydropower, but that wide-scale implementation of mini- and micro-hydropower installations would be difficult. The extreme variations in seasonal flows and the low specific discharges make seasonal storage a requirement for significant amounts of dependable power. All of Lesotho probably has 20 to 40 potentially developable micro-hydro sites in the 5 to 100 kW range. The comparatively high cost of US $3000 to $6000 per kW installed are due to the higher cost of low-head equipment and the need for long, lined headraces. Since installations will be shut down 20 to 30% of the year due to lack of river flow, locations with existing diesel units for back up are preferred. Principal construction problems are site access, stream sediment load and deposition, and active stream bank and hill slope erosion.

30096 (TVA/PUB—84/21a, pp 249-256) **Small hydro in Thailand.** Bunk, G.M. (International Engineering Co., Darien, CT). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Kingdom of Thailand is attempting to reduce its dependence upon imported oil through the development of indigenous energy resources, including hydropower. The Thai electric power system has grown phenomenally during the past 20 years; and hydropower has figured prominently in this growth, mostly through the development of relatively large projects. Because most of the larger hydro sites have been developed or are not available for development at this time, increased emphasis has been placed on development of the country's substantial small hydro resources. Hydro development in Thailand has few impediments; and given an improved world economic outlook, continued development of hydro projects seems certain.

30097 (TVA/PUB—84/21a, pp 257-265) **Development of small-scale hydroelectric power in Puerto Rico.** Gebhard, T.G. Jr.; Rankin, W.H.; Scott, R.D. 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The terrain and stream flow characteristics of Puerto Rico have made hydroelectric power a historically important energy source on the island. In 1936, hydroelectric power provided 66% of the electrical energy. With the growth of an industrialization program in the 1960's, some of the smaller and older hydroelectric sites were retired as oil-fired steam and combustion turbines were installed. Currently, Puerto Rico has an electrical generation system with a nominal capacity of over 4126 MW from oil-fired turbines and 98 MW from hydroelectric turbines. The electrical demand has decreased due, in part, to high electrical prices. The future for hydroelectric power is linked to the cost of fuel for electrical generation. The opportunities for the development of small-scale hydroelectric power include renovating retired facilities, expanding capacity at existing facilities, adding electrical generation to existing dams, and constructing new impoundments and diversion dams. Puerto Rico has many sites with head and flow characteristics typical of economically feasible installations. Although Puerto Rico is promoting the establishment of demonstration projects, no hydro projects have proceeded through the island's permitting process.

30098 (TVA/PUB—84/21b, pp 605-614) **Case study of US-China cooperation in unified resource development.** Armentrout, D.R.; Salisbury, R.F. (Tennessee Valley Authority, Knoxville). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

When diplomatic relations with the People's Republic of China (PRC) were established in the 1970s, the world rediscovered a land rich with resources and inhabited with a hard-working people. The government has since set plans to develop the land and its people with the cooperation of western countries. One of the keys to successful development has always been the availability of power - principally electric power for industry and homes. The cooperative activity between the USA and PRC in the area of hydro power development are discussed.

30099 (TVA/PUB—84/21c, pp 1545-1547) **Opening remarks.** Freeman, R. (Tennessee Valley Authority, Knoxville). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The efforts of the Tennessee Valley Authority in managing the water resources of the Tennessee Valley are discussed. These efforts include studies of dissolved oxygen content in the regions reservoirs, environmental problems and water quality, control of soil erosion, management of recreational areas and land use studies.

30100 (TVA/PUB—84/21c, pp 1548-1565) **Geopolitics of energy: a global perspective on energy, technology, and employment.** Patton, F.S. (Union Carbide Corp., Oak Ridge, TN). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The global economy now over shadows the economies of individual nation-states to such an extent that their domestic markets and manufacturers are not viable as self-contained arenas. In this newly dominant global economy political, social, economic, and energy concerns are interrelated. Authorities charged with decision making - even on a parochial basis - cannot prudently plan without maintaining conversance with these sectors on a global scale. The circumstances which have contributed to the changed status are discussed.

30101 (TVA/PUB—84/21c, pp 1566-1573) **National hydropower study.** Blakey, L.H. (Army Corps of Engineers, Knoxville, TN). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The results of the Corps of Engineers' National Hydropower Study are discussed. The role of the Federal government in financing not only hydropower but all water resource development is also discussed.

30102 (TVA/PUB—84/21c, pp 1574-1582) **Waterpower '83, state of the industry - a summary of the conference.** Domer, R.G.; Salisbury, R.F. 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Emphasis of the past two Waterpower conferences was very heavy on small hydropower development. The need to make the Conference grow into something broader and, hopefully, more beneficial to the profession is emphasized. The two goals to accomplish this objective are: expand the scope to encompass all aspects of hydropower. This is in keeping with TVA's approach to hydropower and is part of an ever-increasing awareness that no single area of the business can stand alone; and bring together a wide range of professions and, within those professions, a diversity of specialties. The conference then becomes an avenue of communication that probably would not exist otherwise. In an age of information explosion, this can only help us all do a better job.

30103 (TVA/PUB—84/21c, pp 1583-1586) **Water in the 21st century.** Willis, W.F. (Tennessee Valley Authority, Knoxville). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The activities of the Tennessee Valley Authority in the development of the water resources of the Tennessee Valley region are summarized. Such activities as land use and management, reclaiming of abandoned mine lands, erosion control, reservoir management, pollution control and water quality studies are reviewed.

1302 Site Geology And Meteorology

30104 (AD-A—152107/9/XAB) **Cooper River rediversion project, St. Stephen Powerplant, St. Stephen, Carolina: engineering considerations and instructions for field personnel.** (Army Engineer District, Savannah, GA (USA)). Jul 1979. 57p. NTIS, PC A04/MF A01.

This manual is intended to serve as a technical guide for the Resident Engineer and his personnel, together with such personnel of the Construction Division who are directly responsible for the construction. These engineering considerations and instructions are intended to explain the various considerations and assumptions, especially regarding field conditions, involved in the design and in the preparation of the contract plans and specifications. They are also for the purpose of commenting upon and explaining certain requirements of the specifications and to establish the requirements necessary to provide Government acceptance testing. Contents: Instructions on Soils and Geology Technical Specifications; Soils and Geology Drawings; Concrete and Concrete Materials; Structural Design and Erection Considerations; Mechanical; Electrical.

30105 (NP—5750808) **Runoff conditions at Kuussuup Tasia, Christianshaab, estimated by modelling.** Braithwaite, R.J.; Hoejmark Thomsen, H. (Groenlands Geologiske Undersoegelse, Copenhagen (Denmark)). Feb 1984. 25p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85750808.

Kuussuup Tasia, east of Christianshaab, has been identified as a potential site of a hydropower project to supply energy to Christianshaab, and possibly to Egedesminde. The present report describes an assessment made at the Geological Survey of Greenland (GGU) of the runoff conditions in connection with investigations supported by the EEC European Regional Development Fund. The work is based upon the GGU runoff-climate model, together with four years of runoff data from Kuussuup Tasia measured by the Greenland Technical Organization (GTO) as well as long-term climate recordings in Jakobshavn by the Danish Meteorological Institute. In the first round of calculations the model greatly overestimates runoff, probably due to the uncertain delineation of the Inland Ice sector draining into the area. However this overestimation is corrected by calibration of the model with the observed runoff data. The results show that the 1980-1983 measured runoff was a little low, both with respect to the 1961-1983 base period and compared to estimated runoff since 1880. The total runoff from Kuussuup Tasia and a nearby ice-dammed lake Tiningnilik appears to be sufficient for the power supply required for Christianshaab and Egedesminde. However, full exploitation of the hydropower potential in the area requires a very large reservoir capacity. The need for some further investigations in the area is stressed.

1303 Plant Design And Operation

REFER ALSO TO CITATION(S) 30095, 30096, 30097, 30098, 30228, 30239, 31042, 31043, 31044, 31045, 31046, 31047

30106 (CONF-7907129—, pp 9-28) **Summary remarks, conclusions, and recommendations of work groups.** May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

The following topics relating to the development of small-scale hydroelectric resources in the West are discussed: engineering and retrofit design, financing and development, licensing and regulation, environment, marketing and utility interface, information and technology transfer, feasibility and economics, and hybrid systems.

30107 (DOE/R8/00434—T1) **Small hydroelectric power plant demonstration project. Final technical report.** (Rocky Mountain Biological Lab., Crested Butte, CO (USA)). [1985]. Contract FG48-79R800434. 6p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011343.

The Rocky Mountain Biological Laboratory has completed construction of a small scale hydroelectric power plant. The plant utilizes water from the Laboratory's domestic water supply, can generate a maximum of 7.5 kW, and supplies electricity to the Laboratory's dining hall for space heat, cooking, and hot water.

30108 (TVA/PUB—84/21a, pp 346-355) **Estimating micro-hydro potential in western North Carolina.** Berkowitz, S.J.; Ayers, H.G. (North Carolina Div. of Health Services, Raleigh). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A methodology was developed for estimating the micro-hydro potential of streams in the southern Appalachian mountain region of western North Carolina. Micro-Hydro sites identified, could produce an average of five to 200 kilowatts, utilizing naturally available stream flow and relief. The methodology was designed to yield consistent, site specific estimates of the maximum feasible production potential throughout the region, making optimal use of available hydrologic and topographic data. The essence of the methodology is the techniques developed for estimating flow and head parameters. An isoclinal map was developed showing normalized average flows available for micro-hydro production. Criteria were established for determining the minimum elevation drops and slopes above which sites would be economically feasible. All sites meeting these criteria were identified, and the maximum economically feasible production potential was determined for each site. Utilizing this methodology, 1591 feasible micro-hydro sites were identified in the study area, with a total average production potential of 28,151 kilowatts. The study area is felt to have the greatest micro-hydro potential of any comparable region in the eastern US.

30109 (TVA/PUB—84/21a, pp 356-365) **Microhydropower Handbook.** McKinney, J.D.; Sommers, G.L. (Idaho National Engineering Lab., Idaho Falls). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A new Microhydropower Handbook has recently been compiled. Funded by the US Department of Energy (DOE), this new Handbook contains more than 800 pages and is much more comprehensive and detailed than the previous DOE booklet on microhydropower. The purpose of this paper is to familiarize you with the Handbook, its content and organization. In this Handbook, microhydropower is defined as hydropower produced in quantities of 100 kW or less. The Handbook has been planned and written so that a lay person, with mechanical aptitude, will have sufficient information to evaluate site potential, lay out a site, select and install equipment, and finally, operate and maintain the completed system. The Handbook is divided into two volumes. Volume one establishes a foundation for the engineering principles, leads the individual through design, construction and operation, and provides information on obtaining financing and on licensing. Volume two is the appendices containing supplementary information, federal and state agencies and their addresses, glossary, and useful forms.

30110 (TVA/PUB—84/21a, pp 376-382) **1000 MW to 5 MW - thinking small: a large utility's experience with its small hydro projects.** Sayed, W. (New York Power Authority). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The New York Power Authority (Authority) has been involved, until recently, in the construction of large power plants and has, therefore, found it challenging to scale down its design requirements in building small hydro power plants. Control schemes, for example, which are essential to large units are too sophisticated for use on small hydro plants and we, therefore, find the designer and the operator trying to reach a compromise. The architect-engineers too have had the need to look inward to modify their design concepts from large units to suit the small hydro power projects. Another area where scale-down in design is not possible is the interconnection costs associated with designing and installing line protection and data transmission to the remote control center. Between small hydro plants, the costs associated with the electrical system is essentially constant, the only variable being the number of generator breakers.

30111 (TVA/PUB—84/21a, pp 383-392) **Assessing the risk of low water.** Cunningham, C.H. (International Engineering Co., Inc., Darien, CT). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Most projections of annual energy generation for small hydro facilities are based on flow duration curves and are expressed in terms of average annual energy. However, time series data are required to assess the variability of the annual energy generation. A technique has been developed that uses data recorded by the USGS in a computer model of a proposed hydro installation to quantify the expected variation in annual energy production. The accuracy of the projections of the average, as well as of the variability of, annual generation is highly dependent upon the accuracy of the

USGS data and the computer model. Topics covered include: how USGS gage data is used in the simulation of the proposed facility's operation; what factors must be included in the computer model of the proposed installation and why a site-specific model is required; and how to use the annual energy generation statistics to check that an appropriate probabilistic model has been selected. Lastly, a comparison is made between the variability of the annual energy generation estimated on the basis of the computer model (using daily flow measurements directly) and the variability of the annual average stream flow. This analysis shows that considerable error will be introduced in the estimate of the variability if average annual flow is used.

30112 (TVA/PUB—84/21a, pp 230-238) **Status of small hydroelectric development in Ontario, Canada.** Graham, D.S. (Univ. of Western Ontario, London). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

In Canada, electric power generation is a provincial jurisdictional matter, and is provided in Ontario by a unique public utility (Ontario Hydro). Private development of small hydro sites is now permitted and the Province of Ontario has embarked upon a small hydro encouragement program. Its concept is similar to that of the US DOE small hydro programs in many respects, but its progress will be affected by significant political/institutional differences with the US. Seven demonstration projects are now underway. Development of the industry is currently limited by several factors; the most important of which are unrealistically low prices offered for the energy and power by Ontario Hydro, and lack of an effective legal and administrative structure for project ownership and licensing.

30113 (TVA/PUB—84/21a, pp 274-283) **Hydropower civil works - procedures and pitfalls.** Good, A.M. 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The processes necessary to direct the design and construction of the structures required to house and service hydroelectric generation facilities, from the point of view of the developer are discussed. The design issues reviewed include: selection of the engineer, conceptual design, and project design, detailing aspects of access, hydraulics, structural requirements and architectural features. Construction aspects studied include: selection of the contractor, quality assurance and inspection, and contractor's procedures.

30114 (TVA/PUB—84/21a, pp 284-296) **Experiences on mini hydro feasibility studies for isolated sites in Alaska and Malaysia.** Little, G.E. (Tudor Engineering Co., San Francisco, CA). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The methodologies, assumptions, and criteria utilized in conducting feasibility studies for mini-hydro hydroelectric projects for 41 sites in peninsular Malaysia and 4 sites at isolated sites in Alaska are described. All sites were simple run-of-the-stream diversion projects consisting of a small diversion weir, an intake structure, a penstock with an access road, the power plant, and a transmission line extending to the point of use. The general procedures utilized in conducting the studies are covered, followed by a discussion of the key aspects including hydrologic methodologies, energy planning, pre-reconnaissance activities, field investigation procedures, field surveys, project layouts, turbine/generator equipment, cost estimates, economic analysis, and excess energy utilization.

30115 (TVA/PUB—84/21a, pp 297-305) **Truckee-Donner PUD's small-scale hydro at Boca Dam.** Peters, K.B.; Conwell, J.C. (James Hansen and Associates, Inc., San Francisco, CA). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The planning process, the coordination between Truckee-Donner Public Utility District (Truckee), and US Bureau of Reclamation (Reclamation), and the engineering considerations in developing a larger, more economical hydroelectric facility at Boca Dam are described. During the planning process for developing a hydroelectric facility, four separate proposals were made; one by Reclamation, and three by Truckee. The latest proposal for the Federal Energy Regulatory Commission (FERC) license application was based on a reanalysis of the flow duration curve, physical facilities, estimated generation benefits, and coordination between Truckee and Reclamation.

30116 (TVA/PUB—84/21a, pp 306-315) **Standardized design components for mini-hydro development.** Pruitt, L.L. (Stanley Consultants, Inc., Muscatine, IA). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A series of standardized designs has been developed for use in local and regional mini-hydro programs. Much of the exploratory work involved in development of these tools was performed in the recently completed Malaysian mini-hydro program. During that effort, over 200 potential mini-hydro project locations were screened to select the final 41 sites for which detailed designs were prepared. Over 150 possible locations for mini-hydro development were visited in the jungle areas of the east coast states of peninsular Malaysia. In addition to the on-the-ground reconnaissance, data gathering included assembling information regarding site accessibility, hydrology, geologic characteristics, and power needs at nearby villages. Feasibility studies concluded that 38 of the 41 sites were economically justifiable, based on rigid international funding agency criteria. The standardized designs are based on detailed site reconnaissance, survey, and optimization of the 41 project locations. Emphasis is placed on run-of-river projects which would typically be located in remote areas. Capacities range from 50 kW to just over 1000 kW with a broad spectrum of hydraulic heads (from 8 to over 400 meters). A typical mini-hydro installation includes a low diversion dam, intake chamber with trash rack, settling basin, penstock, powerhouse, tailrace, electric switchyard, and transmission line. Penstock sizes range from 300 to 1800 mm diameter; lengths are 0.1 to 1.8 kilometers. Three types of turbines are considered, depending upon the head and flow conditions available. The standardized design of the significant mini-hydro project components which may be useful for development at other locations is discussed.

30117 (TVA/PUB—84/21a, pp 316-324) **French Broad EMC's Capitola Project - 3 MW with 14 feet of head.** O'Neill, T.J. (Tudor Engineering Co., Atlanta, GA). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Capitola Hydroelectric Project is a small-scale, low-head facility currently under construction on the French Broad River in Marshall, North Carolina, approximately 70 miles east of Knoxville. The project is being developed by the French Broad Electric Membership Corporation, which serves approximately 20,000 customers in a six county region northwest of Asheville. The proposed Capitola Project will generate 3000 kilowatts of power with a rated head of 14 feet. All power and energy will be utilized internally by French Broad EMC and thus will supplant power purchases. The project will make use of an existing, eight-foot high dam which serves to divert water into a 550-foot long, headrace canal. The dam, which was constructed in the early 1900's, will require some rehabilitation work and will be fitted with 3 feet of adjustable flashboards along its crest. The project will generate approximately 20 million kilowatt-hours per year. Currently, on-site construction of the project is underway. A contract has been let to furnish and install two 1500 kilowatt horizontal Kaplan turbine/generators. The project is expected to come on line in late 1984. Total cost of the project is approximately $8,000,000.

30118 (TVA/PUB—84/21a, pp 325-334) **Economical solution of low-head turbine application from a hydraulic point of view.** Ulith, P.; Wolfram, F. (J.M. Voith GmbH, Heidenheim, West Germany). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

For the development of hydro power potential with low head, four solutions are presented. For an assumed example, different types of turbines were laid out, which, in their turn also influence the conception of the powerhouse. The head losses involved in the different conceptions, as well as the efficiencies, are presented. The annual energy productions attainable with the different types of turbines result in an order of rank from the hydraulic point of view. Finally, with the help of assumed factors regarding costs of powerhouse and machines on the one hand the utilizable energy on the other, a comparison between the different conceptions is attempted from the economical point of view, in order to assist the planning engineer in search of the optimal solution.

30119 (TVA/PUB—84/21a, pp 335-345) **Hydropower - tailoring it to fit.** Bruton, O.W. (Army Corps of Engineers, Portland, OR). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

In the early phases of hydropower evaluation, economic techniques play a most important role. Some of the techniques used in determining a hydro project's economic feasibility are presented and the optimum development for the site is discussed. Before a project can move into the design stages, an optimization or scoping process must be performed. This process must be accomplished using economic procedures, tempered by marketability and environmental considerations. Project benefits are most commonly determined by either of the following methods: the cost of the alternative thermal plant, or the value of displaced thermal generation (fuel displacement). Procedures for determining a project's energy output and dependable capacity are also discussed. Finally, examples of the two different evaluation techniques taken from two recently completed feasibility level project studies are discussed. The emphasis is on Federal development; however, these procedures can be a useful tool in assisting both public and private planners in evaluating and developing hydropower resources.

30120 (TVA/PUB—84/21a, pp 3-12) **4.2 MW hydro power plant for Radio Station HCJB, Papallacta, Ecuador, S.A.** Moore, S.E.; McKay, H.G. III; Howell, R.E. (Radio Station HCJB, Quito, Ecuador). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

International Radio Station HCJB, more commonly known as The Voice of the Andes, is a high powered private missionary short wave radio station located in Ecuador, S.A. The station is part of the organization (WRMF) World Radio Missionary Fellowship. This short wave radio station's broadcast week contains over 500 program hours and around 2230 transmitter hours. The transmitters have a combined signal power of over 1 million watts which can be heard around the world. The energy to power these large radio transmitters, plus other ancillary loads, is provided by a small hydro electric power station which is owned and operated by HCJB. The plant has two small hydro units, 1.8 MW capacity and 4.2 MW capacity. The 1.8 MW unit is a used, 1900 vintage horizontal turbine/generator unit which was transported from the US to Ecuador and installed in 1965. In 1982, a new 4.2 MW horizontal turbine/generator unit was installed to provide energy for larger and more modern short wave transmitters. The power station is located high in the Andes Mountains of Ecuador on the Papallacta River. This small river is part of the head waters of the Amazon River. The electrical energy is transmitted to the west across the continental divide some 40 km to the radio station transmitter site. The stream flow of the Papallacta River is seasonal. The dry season (low flow) occurs from October to February while the wet season (high flow) is March through September. The proper management of the highly variable stream flow is critical to the efficient and effective operation of the two units. The water source will be monitored and managed by a uniquely designed reservoir and stream flow monitoring system. The design and construction of the 4.2 MW hydroelectric power plant are discussed.

30121 (TVA/PUB—84/21a, pp 13-22) **Hydroelectric development activities of rural electric systems.** Prichett, W. (National Rural Electric Cooperative Association, Washington, DC). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Rural Electric Systems are well acquainted with hydropower. The backbone of the Federal power supply system upon which the Rural Electric Systems depend is hydroelectric. In addition, during the 1950's, the Rural Electric Systems, themselves, built and/or owned and operated 43 small hydroelectric generating plants. During the 1960's and 1970's, as these plants became antiquated and expensive to operate, they were abandoned and fell into disrepair (as, of course, did many other similar facilities in the US). Today, the Rural Electric Systems are very active in renovating these plants along with developing the hydro potential at additional sites in their service territories. Since the hydroelectric development process in the US follows a process of permitting, licensing, and finally plant construction and operation, these many Rural Electric small hydro activities are discussed according to this logical sequence.

30122 (TVA/PUB—84/21a, pp 23-32) **Rehabilitation of the orchard mesa turbine-pump units.** Mehring, C.W. (Tipton and Kalmbach, Inc., Denver, CO). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Orchard Mesa Irrigation District and its predecessors have used water power to lift its irrigation supplies from its power canal to its distribution canals since approximately 1910. The four units presently in use were installed in 1925 and have been in continuous service during the irrigation season since that time. The water supply for the project is the flow of the Colorado River which contains considerable amounts of sediments. The abrasive nature of the water supply causes wear to the impellers and runners of the units, and the capacity of the units gradually reduces during the irrigation season. Each year, during the non-irrigation season, it is necessary to tear down each unit, build up the impeller and runner, and reassemble the unit. The efficiency of the units has gradually decreased over the years to the point that the units can no longer satisfy the water requirements of the project. The characteristics and cost of the units that have been ordered to replace the existing units are discussed.

30123 (TVA/PUB—84/21a, pp 33-41) **Redeveloping a low head open flume power house concept to reality at Potsdam, New York.** Gannett, W. (Rist-Frost Associates, Glens Falls, NY). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Village of Potsdam, New York constructed a hydroelectric station and water treatment plant complex on the Raquette River in 1926. The powerhouse had two concrete flumes with timber intake gates. A 42-inch vertical turbine was set in one of the flumes, discharging to the tail-race through a conical steel draft tube. At the rated 9.5 feet head and 268 CFS design flow, the unit produced 150 kW for the water plant. The plant was retired in 1971. In 1976, the Village engaged Rist-Frost Associates, to examine the feasibility of redeveloping the site. Preliminary studies and financial projections showed that a redevelopment would be viable. In 1980, the redevelopment concept was refined and final designs prepared. The selected concept consisted of two 400 kW semi-Kaplan vertical turbines set in the existing flumes, with concrete elbow draft tubes for efficient outlet hydraulics. In the course of design, construction and installation, a number of interesting constraints had to be addressed. These issues included low head, limited room on site, operation flexibility requirements, and the necessity to sequence construction around an operating water treatment plant. The effects of increasing design flows were examined in a model test. How the design issues were resolved, and how the construction progressed as this small, low-head hydro project was redeveloped as an operating facility are discussed.

30124 (TVA/PUB—84/21a, pp 42-51) **Design and construction of the Granby Hydro Redevelopment Project.** Vanderburgh, M.R.; Costello, J.P.; Gill, H.S. (Acres American Inc., Buffalo, NY). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Granby Hydroelectric Redevelopment Project was the first facility of its type to be completed by an investor-owned utility in New York State since the 1973-74 oil embargo. Resolution of important issues relative to water quality and inclusion of the state dam in the license required a lengthy licensing period. Design and construction of the project was influenced to a great degree by an extremely limited site area and the need to maintain structural integrity of existing structures during dewatering and excavation. Construction commenced on site in October 1980, approximately 32 months after submission of the FERC license application. The project went into commercial operation in the spring of 1983.

30125 (TVA/PUB—84/21a, pp 52-62) **Upper mechanicville hydroelectric redevelopment project.** Case, J.J.; Sinclair, J.P. (New York State Electric and Gas Corp., Binghamton). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Upper Mechanicville Project is the first hydroelectric plant to be developed in recent years by the New York State Electric and Gas Corporation (NYSEG). The project is located at Lock and Dam No. 3 on the Hudson River about 20 miles upstream of Albany, New York. The lock and dam facilities are a part of the New York State Department of Transportation (DOT) Champlain Barge Canal navigation system. The new station, with a capacity of 16.8 MW, will replace the original generating facilities (about 5.5 MW) which were abandoned by the former owner in 1977. Design of the project relied heavily on hydraulic model studies from which the need for a number of features and design modifications, to ensure acceptable flow conditions in the intake and tailrace channels, was identified, The project is scheduled for completion in the third quarter of 1983. The new powerhouse will have two conventional vertical-shaft, double regulated, Kaplan turbines, each driving an 8.4 MW synchronous generator. The design flow is 12,000 ft^3/s and the rated net head for the turbines is 19 ft. The turbine runner diameter is 216 inches and the unit spacing is 61 ft. It must be realized, therefore, that the main feature which qualifies this project as small-scale is the relatively low head and capacity.

30126 (TVA/PUB—84/21a, pp 63-73) **Rehabilitation of timber crib hydro dam, Caribou, Maine.** Nadeua, J.H.; Lucks, A.S.; Bryant, J.H. (Stone and Webster Engineering Corp., Boston, MA). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The installation of the sheet piling cutoff wall and structural repairs made to an 87-year-old timber crib dam are described. Descriptions of site investigations and cofferdam methods, as well as cost data, are also included.

30127 (TVA/PUB—84/21a, pp 74-83) **Practical applications for pumps as hydraulic turbines for small scale hydropower.** Shafer, L.L. (McGraw-Edison Co., Taneytown, MD). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The use of pumps as hydraulic turbines offers many advantages for the small power producer. However, careful design reviews are required prior to their use in order to assure satisfactory operation. Pumps have been successfully applied as turbines as drives for other rotating equipment, for pressure reduction in pipelines where electrical production is a by-product and, of course, for projects where power generation for the purpose of producing electricity for a profit is the key objective. Examples of each of these types of installations are discussed, demonstrating the versatility of reverse running pumps for turbine applications.

30128 (TVA/PUB—84/21a, pp 84-93) **Machine selection and powerhouse design for small hydropower schemes.** Leyland, B.W. (Leyland Watson & Noble, Auckland, New Zealand). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

By optimizing and integrating the selection of machines and the design of powerhouses, both cost and complication can be reduced. These aspects are discussed and some innovative designs adopted in New Zealand are described.

30129 (TVA/PUB—84/21a, pp 94-101) **Inverted Flow Concrete-Built Siphon System.** Bourgeacq, J.P. (Page Hydro Power Systems, Inc., Iowa City, IA). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The development, construction details and maintenance, and operating experience of the Inverted Flow Concrete-built Siphon System as developed in France by Mecamidi (Turbine Manufacturer) and Page Engineering (Design Engineers) are described. Advantages of the inverted flow-siphon principle are described. Its economic attractiveness and ease of incorporation into new or existing low-head dams are presented. Reduction of vibration problems inherent in many siphon systems reduces maintenance. Replacement of the normal turbine shut-off valve by a simple siphon breaker device is a reliable, simple, cost-saving alternative.

30130 (TVA/PUB—84/21a, pp 102-111) **Utilization of hydropower of small irrigation structures.** Mankbadi, R.R.; Mikhail, S.; Baz, A. (Cairo Univ., Egypt). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Several hydroenergy conversion systems are considered for utilizing low-head hydro. The turbine-pump system, installed across irrigation structures is discussed. The available low-head energy is used to drive a turbine connected to a pump, to lift water for irrigation or domestic purposes. The equations governing the operation of the system are considered. For a given regulator's characteristics, a method is presented for determining the main design parameters of the system. Off-design performance of the system can be controlled to achieve maximum pumped flow all over the year. The turbine-pump system should thus be considered wherever low-head power is available and there is a demand for water to be pumped at a higher head.

30131 (TVA/PUB—84/21a, pp 112-120) **Philosophy, theory and practice of low-cost micro-hydro.** Woodward, J.L.; Boys, J.T.; Elder, J.M. (Univ. of Auckland, New Zealand). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The need to reduce costs through simplification and standardization of equipment is emphasized, if stand-alone micro hydro is to become practicable. The operation and features of a modular electronic load governor developed with this in mind are described. Operated in conjunction with the load governor and capacitive excitation devices, standard induction machines offer further advantages. Operating experience to date is described.

30132 (TVA/PUB—84/21a, pp 121-130) **Low-head turbine studies for Lock & Dam 14 Power Project.** Williams, J.; Guild, D.J.; Hawks, J.E. (Tudor Engineering Co., Denver, CO). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The engineering and cost studies that were recently completed for the feasibility level design, included in the FERC License Application for the Lock & Dam 14 Power Project on the Mississippi River, included an analysis of different turbine types and sizes for the hydraulic machinery features. Special studies were conducted for the turbines because of the ultra low-head (8 to 11 feet) installation, and because it was recognized that the hydraulic machinery will comprise a significant portion of the project cost. Power studies and cost estimates were prepared for different plant capacities based on either tubular, pit or siphon-type turbines. The turbine runner diameter sizes ranged from 3.6m to 5.5m. Manufacturer's information, as well as the principles of dynamic similarity, were utilized to estimate the turbine power characteristics, and the cost estimates were based on manufacturer quotes and recent bid prices. The pit-type turbines were found to have the highest power output of the three types for the same runner diameter. The preliminary cost estimates indicated that a plant with the smaller machines will have somewhat lower civil works costs per installed unit than the larger machines, but that the total civil works costs were found to remain reasonably constant as the runner diameters varied. The cost per kilowatt for the hydraulic machinery is significantly less for the larger machines than for the smaller.

30133 (TVA/PUB—84/21a, pp 131-140) **Optimization and selection of penstock and power equipment minihydro installations.** McAlister, I.J. (Stanley Consultants, Inc., Muscatine, IA). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The development and use of tools for the analysis and optimization of minihydro penstock requirements are presented. A simple relation is proposed expressing penstock diameter in terms of rated power output and rated head. A similar relation for diameter in terms of rated flow and gross head is also given. Consideration is given in terms of cost to the variation in power equipment size and type when determining optimum penstock size. The relationship between power output, head, and penstock length is examined to determine a minimum slope for the feasible addition of incremental penstock length. The relationships presented are derived from recent experience on projects reflecting a wide range of minihydro site conditions.

30134 (TVA/PUB—84/21a, pp 141-150) **Small hydro turbine selection: three case studies.** Adams, B.H. (E.C. Jordan Co., Portland, ME). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The selection of hydraulic turbines for small hydroelectric projects is discussed. Three projects in Maine, ranging in size from 1000 kW to 14,000 kW are used as examples. Experience to date on two of the projects is also discussed. The smallest of the three is the 1050 kW Gardiner Hydroelectric Project owned by the Swift River Company. The second project is the 4000 kW Shawmut Station Expansion on the Kennebec River owned by Central Maine Power Company. The third is the Bangor Hydro-Electric Company's West Enfield Project on the Penobscot River.

30135 (TVA/PUB—84/21a, pp 151-158) **Walterhill small hydro project.** Flew, G. (Allen & Hoshall, Inc., Nashville, TN). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Walterhill site near Murfreesboro, Tennessee, has been used as a dam for almost 180 years. Off and on for approximately 35 years, until 1940, the site was utilized to generate electric power. The dam is currently owned by the City of Murfreesboro and is used solely for the purpose of domestic raw water supply. In September 1980, the Middle Tennessee Electric Membership Corporation (MTEMC) saw the idle Walterhill site as an opportunity to develop a renewable natural resource. MTEMC retained the firm of Allen & Hoshall, Inc., to prepare a feasibility study of the installation of hydroelectric generation equipment at the site. The study was financed jointly by MTEMC, the Tennessee Valley Authority and the Tennessee Valley Public Power Association. The result of the study indicated that the Project was indeed economically feasible. However, the investigation showed that, due to the size of the installation, an economical installation could not be achieved utilizing traditional turbine/generator equipment. One alternative investigated proposed the installation of a marine thruster in place of a traditional turbine. This proved to be not only the single alternative with positive economics studied (benefit/cost ratio greater than 1.0), but, with a benefit/cost ratio of approximately 2.5, also an extremely viable project. In the section of the study related to financing, it was suggested that, due to the risk inherent with the installation of the marine thruster, MTEMC seek third party financing for the purpose of risk aversion. At this point, MTEMC is seeking such a financing arrangement and has cleared all licensing and leasing obstacles for completion of the Project.

30136 (TVA/PUB—84/21a, pp 159-167) **Wailua River hydropower study, Kauai, Hawaii.** Pennaz, J. (Army Corps of Engineers, Honolulu, HI). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The US Army Corps of Engineers is actively engaged in developing small-scale hydropower on Pacific islands. Most of the islands are entirely dependent upon expensive oil-fueled generation for their power needs. Hydropower development is attractive because the islands can develop their own energy resources and become less dependent on outside sources of energy. A case study of a 5.7-megawatt hydropower plant on the island of Kauai is presented. The Wailua River Hydropower Project is a run-of-the-river project, with the intake structure and diversion dam located about 500 feet upstream of a 190-foot high waterfall. The waterfall is a significant tourist attraction and is featured on the introduction to the television show Fantasy Island. Compatibility of the project with the tourist attraction was an environmental consideration. Hydrologic considerations are interesting in that the headwaters are documented as the wettest area on earth. Water for the plant flows through an intricate network of diversion tunnels and canals used by the Lihue Plantation for sugarcane irrigation. Improvement of an irrigation intake is required for this project. Significant features of the $11.6 million project include a 250-foot long by 13-foot high intake diversion dam, a 9-foot diameter concrete underground conduit, a 72-inch diameter penstock, and 2 Francis turbines of 3.8 megawatts and 1.9 megawatts capacity.

30137 (TVA/PUB—84/21a, pp 168-176) **Generating hydropower from municipal drinking water supply systems.** Heim, W.P. (Energy and Resource Consultants, Inc., Boulder, CO). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Municipal drinking water systems that are gravity fed may be tapped for hydropower. The pressurized water frequently needs to pass through pressure reducing valves prior to entering water treatment plants. By installing a turbine-generator to reduce the pressure, electricity can be produced. This arrangement has advantages and disadvantages compared to traditional small-scale hydropower projects.

30138 (TVA/PUB—84/21a, pp 177-186) **Design & evaluation of microhydroturbines (<5HP).** Marquis, J.A. (Tennessee Technological Univ., Cookeville). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The primary objective of this study was to evaluate the design and performance characteristics of microhydroturbines suitable for single-user generating applications. Examples include rural farms and residencies, remote park locations or small commercial operations where at least selective or partial electric demand could be met by harnessing nearby springs or streams. During the course of the project, in consultation with individuals from this area of the country who expressed an interest in the implementation of a microhydro generating system, it was found that usable on-site heads and flows in excess of 50 ft. and 2 CFS were uncommon. Consequently, the study was confined to heads below 50 feet and flows under 2 CFS, with turbines capable of from 1 to 5 HP (3/4 to 3-3/4 kW) shaft output. The major tasks completed in the course of the study were: (1) design, construction and instrumentation of a suitable test facility, (2) selection and acquisition of representative turbine types for evaluation, (3) testing and evaluation of turbines in standard and modified configurations, and (4) formulation of conclusions and recommendations.

30139 (TVA/PUB—84/21a, pp 187-195) **Small-scale hydropower from irrigation canals.** Heggen, R.J. (Univ. of New Mexico, Albuquerque). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Although intermittent and highly variable streamflows restrict hydroelectric potential throughout New Mexico, there exist possibilities for small-scale hydroelectric (SSH) development in irrigation canals. Flows in these canals have low volume, low head, and relatively constant seasonal discharge. The environmentally attractive nature of SSH, as well as the proximity of canal sites to irrigation pumping stations, make canal SSH a possible source of hydropower for pumps or other remote, small, seasonal electric demands. Engineering and economic feasibility is assessed for two demonstration sites meeting institutional, regulatory, environmental, and legal constraints. Design parameters, required equipment, power plant layout, and power production are evaluated.

30140 (TVA/PUB—84/21a, pp 196-205) **Assumptions on feasibility studies of small hydro projects.** Sant'Ana, R.F.; Li, R.M. (Universidade Federal do Parana, Curitiba, Brazil). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Assessing the feasibility of small hydro projects often requires the approximation of many key factors in the initial phases because of unavailability of data and/or study cost constraints. A three-level approach method identifying critical variables for the characterization of a feasible project is suggested. The effect that changes in those variables (data values or assumptions) may have on the definition of the optimum plant size and its correspondent economic/financial indices is analyzed.

30141 (TVA/PUB—84/21a, pp 206-212) **Present situation of small hydropower development in Japan.** Matsumura, Y. (Electric Power Development Co., Ltd., Japan). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The current state of hydropower development in Japan is described including the various measures taken on research and development and the expediting of small hydropower exploitation, mainly in the field of civil engineering.

30142 (TVA/PUB—84/21a, pp 213-222) **Standardized turbines for mini hydro plants.** Eissfeldt, G. (Voith Hydro Inc., Upper Saddle River, NJ). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Renewed awareness of energy problems has prompted governments throughout the world to promote the development of mini hydro power. Particularly in the United States, there is a possibility of implementing mini hydro power projects only if their overall economy can be evidenced. The principal factors for this are: development cost, operating cost, and attainable yields. All three factors are influenced to a considerable extent by the mechanical equipment. The increasing demand for low-cost turbines of proven design for mini hydro plants has prompted several manufacturers to develop standardized programs. The success of those programs will depend on whether they can meet the individual requirements of the hydro power stations. The standard program of mini-turbines is described. This program has been developed on the basis of the following requirements: (1) long service life, (2) optimum performance, (3) low maintenance, and (4) easy erection. The procedure of standardization is described on the basis of an example of a Pelton turbine, beginning with the determination of the range of application up to the selective diagram.

30143 (TVA/PUB—84/21a, pp 223-229) **Connecting small hydroelectric generation onto the power system.** Ballentine, C.L. (Tennessee Valley Authority). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Some of the problems associated with connecting generators to distribution systems are discussed. Although these problems are significant, they can be overcome if dealt with properly. Two generating installations are discussed and suggested design presented.

30144 (TVA/PUB—84/21b, pp 585-594) **Computer analysis and field correlation from the hydraulic transient program CORA.** Deitz, R.E. (Allis-Chalmers Fluid Products Co., York, PA). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

In 1976, a sophisticated computer program CORA was developed to analyze the hydraulic transients generated in complex penstock systems. More than 200 various hydraulic systems have been analyzed using CORA with over 40 field correlations. Some of the more interesting applications and results are discussed. Computer plots of the various analyses and some field correlations are included.

30145 (TVA/PUB—84/21b, pp 625-634) **Homathko development.** McIntosh, I.F.; Kadak, P.A. (British Columbia Hydro, Vancouver). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

There are abundant sources of hydroelectric power available in British Columbia, Canada's westernmost province. B.C. Hydro, a provincial crown corporation, currently provides electric service to areas containing 93% of the 2.6 million people living in British Columbia. B.C. Hydro is studying possible hydroelectric development of the Homathko River, located about 270 km northwest of Vancouver, British Columbia. Preliminary engineering and environmental studies, completed in early 1982, recommended that a development scheme, consisting of four projects having a generating capacity of 900 MW and producing 4800 GW.h of energy annually, be explored in greater detail. The studies, now in progress, needed to establish the engineering feasibility and determine the environmental consequences of this development are described.

30146 (TVA/PUB—84/21b, pp 635-644) **Structural solutions to unique architectural features at Richard B. Russell Powerhouse.** Granade, C.J. Jr. (Army Corps of Engineers, Mobile, AL). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Richard B. Russell Project is located on the Savannah River, between Georgia and South Carolina. The powerhouse was designed by the Mobile District for the Savannah District and is presently under construction. During the design phase the firm of Marcel Breuer and Associates was selected to provide architectural enhancement of the superstructure and functional integration of public areas with the general powerhouse design. The resulting architectural design by Marcel Breuer produced some unique structural problems which required a considerable amount of study, investigation, and innovation. This project illustrates how the structural engineer and the architect can work together to provide a structurally adequate and safe building and yet preserve the desired architectural effects.

30147 (TVA/PUB—84/21b, pp 645-654) **Sidney A. Murray, Jr. Hydroelectric Station.** Lancaster, J.B. Jr.; Renau, G. (Forte and Tablada, Inc., Baton Rouge, LA). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The town of Vidalia, Louisiana, is at the present time implementing a low head hydroelectric scheme in which some of the most advanced techniques in the world will be incorporated. The project, located in the State of Louisiana, will use a portion of the water diverted from the Mississippi River to the Red/Atchafalaya Rivers at the US Corps of Engineers' Old River Control Project. The Sidney A. Murray, Jr. Hydroelectric Station will have eight bulb turbine units with total installed capacity of 192 MW. The feasibility studies and preliminary design showed that although the available head was very low (averaging 14 feet) it was possible to make the project feasible by using new techniques to lower the construction cost. Some of the special features incorporated in the project are described.

30148 (TVA/PUB—84/21b, pp 655-664) **Design concept of Shuikou Hydroelectric Project, China.** Degong, Y.; Sarkaria, G.S. (ECHIDI-East China Hydroelectric Investigation and Design Institute, Hangzhou). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The proposed Shuikou Hydroelectric Project on the Min River will have an installed capacity of 1400 MW. Principal features of the project are: a 100 m high concrete gravity dam, an overflow type spillway with a capacity of 53,000 m^3/s, a navigation lock and a 7-unit powerhouse. Selection of the design concept, arrangement of the project facilities and the plan for diversion of the river during construction are described.

30149 (TVA/PUB—84/21b, pp 674-681) **Installation of a hydroelectric generating plant at the Ullum Dam.** Moore, E.T.; Martin, D.A.; Lhez, H.H. (Harza Engineering Co., Chicago, IL). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

How in the interest of economy, one large generating unit was adapted to the limited space provided in an existing dam where originally three smaller units had been contemplated is discussed. Operational restraints and regulating characteristics are also discussed.

30150 (TVA/PUB—84/21b, pp 682-691) **River control at a very large hydropower project.** Sarkaria, G.S. (International Engineering Company, Inc., San Francisco, CA). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Construction of Itaipu Hydropower Project reached a major milestone in October 1982, when the dam was completed and the reservoir filled. The spillway has been in almost continuous operation since November 1982. The following aspects of the 12,600 MW project on the border between Brazil and Paraguay, which are related to the control of the river, are discussed: 1) diversion of the river in 1978, 2) closure of the diversion sluices and first filling of the reservoir, and 3) the spillway and its first operation.

30151 (TVA/PUB—84/21b, pp 692-699) **Underwater lake tapping in Alaska.** Hougen, O. (International Engineering Company, Inc., San Francisco, CA). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

In Northern Europe, lake tapping is a conventional engineering task to utilize the natural storage in a lake without building a dam. Currently, the 20-MW Tyee Lake Hydroelectric Project in southeast Alaska is using this technique. Lake tapping has been used on other projects in the US; however, this is probably the first time a lake tap has been performed in the States directly from the power tunnel with the so-called wet method. The planning, design, and construction of the Tyee lake tap are described.

30152 (TVA/PUB—84/21b, pp 700-709) **Hydroelectric development of a large irrigation system.** Butler, A.J.; Taylor, W.H.; Russell, D.P. (Schuchart and Associates, Inc., Seattle, WA). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Columbia Basin Irrigation System has a number of natural and man-made sites where the flowing water drops 30 feet or more. The program to develop hydroelectric power at four of these sites is described. Plant sizes range from 2 MW to 92 MW. Environmental and social effects are discussed in the context of the federal licensing process.

30153 (TVA/PUB—84/21b, pp 731-740) **Mechanical design of the Bonneville second powerhouse.** Moentenich, B.L. (Corps of Engineers, Portland, OR). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The construction of large upstream storage reservoirs on the Columbia River and the need for efficient river management required additional hydraulic capacity at the Bonneville Project. In May of 1981, power-on-line (POL) was achieved for a 560 megawatt capacity second powerhouse. The design, selection, and physical description of the major mechanical systems and sub-systems are discussed. Also discussed are problems experienced during initial operation of the plant. All of the generating units are now operating and the powerhouse was officially dedicated on June 1, 1983.

30154 (TVA/PUB—84/21b, pp 751-760) **Kingsley Hydroelectric Project.** Hamilton, E.L.; Wiedemann, P.F. (Central Nebraska Public Power and Irrigation District, Holdrege). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A 50 MW hydroelectric turbine-generator unit is being constructed at an existing irrigation water storage dam and reservoir. Kinglsey Dam and Lake McConaughy are located in west central Nebraska. The project is share by The Central Nebraska Public Power and Irrigation District and the Nebraska Public Power District. Water flows must be maintained from Lake McConoughy during construction. A minor flow is necessary fall, winter and spring and major flows are needed for irrigation in the summer. The existing downstream Keystone Diversion Dam has been modified to allow Lake Ogallala, between the two dams, to be used as a re-regulating reservoir.

30155 (TVA/PUB—84/21b, pp 761-770) **Friant Power Project: non-federal power at a reclamation facility.** Boudreau, J.E.; Richardson, J.L.; Isbester, T.J.; Conwell, J.C. (Friant Power Authority, Terra Bella, CA). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Designs for powerplants at Friant Dam were produced through the challenging cooperative efforts of Tudor Engineering Company and the Bureau of Reclamation. Complex problems successfully resolved included penstock tie-in, valve submergence, energy dissipation, time constraints, and lining limitation. Several of the problems were solved by the use of a physical model.

30156 (TVA/PUB—84/21b, pp 771-780) **Experience curves for selection of modern low-head turbines.** Kpordze, K.C.S.; Warnick, C.C. (Univ. of Idaho, Moscow). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Experience curves and procedures for preliminary selection of turbine speed and diameter have been developed for bulb, tubular and cross-flow turbines. This is based on regression analysis of manufacturer's data on over 300 manufactured turbines.

30157 (TVA/PUB—84/21b, pp 781-790) **Recent developments of the Turgo Impulse Turbine.** Watson, A.L. (Gilbert Gilkes and Gordon Ltd., Kendal, England). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The choice of hydraulic turbine to give maximum return of revenue from the typical exceedance curve is a difficult decision to make. The virtue of the impulse turbine for this purpose with its good part load efficiency and simplicity of design is discussed. In particular, the advantages of using high specific speed impulse turbines, such as the Turgo Impulse turbine manufactured by Gilbert Gilkes and Gordon, to cover the range of conditions are described.

30158 (TVA/PUB—84/21b, pp 791-802) **Layout, design, erection and operating experience of low head turbines.** Hoeller, H.K., Grein, H.; Hollenstein, M. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The layout procedure of low head turbines based on extensive model tests is described. It is shown how annual energy production with respect to total investment cost is maximized for a given flow duration curve of a run of the river plant. Various typical designs of low head turbines are presented. Erection procedure and operating experience are commented. It is emphasized that profitability is particularly dependent of the turbine type and the design of the turbine. Inlet and civil engineering structure upstream of the intake should be based on model tests.

30159 (TVA/PUB—84/21b, pp 803-812) **Effect of increased dimensions on the design and manufacture of water turbines.** Casacci, S.; Caillot, G.; Wegner, M. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

In the field of big hydroelectric schemes, cost-saving considerations lead the customers and manufacturers to contemplate ever-increasing unit outputs. Over the past 20 years, the output of medium-head Francis turbines has increased from 200 MW to 800 MW. Design and manufacture of such giant turbines cannot be based on a mere extrapolation or similarity study from the units already in service. From the hydraulic and mechanical design of the manufacturing process, the the manufacturers must solve new problems specific to these widely-sized machines while reducing their overall cost and increasing their efficiency.

30160 (TVA/PUB—84/21b, pp 813-821) **Gears for hydro bulb turbines, 10-100 MW, and station design.** Cederberg, B. (Stal-Laval Turbin AB, Finspong, Sweden). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The geared bulb design has established its feasibility for higher powers by the Avesta plant, 2 x 14 MW, commissioned 1982, and the Sidney A. Murray Jr. Station, 8 x 24 MW, now being contracted. In the range 10-100 MW and for heads up to 13-15 m the geared bulb unit is cheaper, has a higher efficiency and a better unit availability than conventional designs. Presently 600 rpm generators are used, but by using a new type of coupling standardized design of 900-1200 rpm generators can be used in the near future. Geared bulb units permit a new design of dam and power house to be used. Power plant costs can be cut by 10-25% by using geared bulb units.

30161 (TVA/PUB—84/21b, pp 822-831) **Hydro generators for low-head applications.** Ferguson, J.H. (Canadian General Electric, Peterborough, Ontario). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Low-head hydro applications may have a different arrangement of the generating equipment than the familiar vertical-axis configuration used with conventional hydro generators. The reasons for these differences are reviewed and the horizontal-axis arrangements of both the bulb and straight-flow turbines are described. The characteristics of the generators for these arrangements are discussed using two recently installed generators as examples: the 18.2 MV.A bulb-type generator for St. Mary's and the 19.1 MV.A rim-type generator for Annapolis Royal.

30162 (TVA/PUB—84/21b, pp 841-850) **Modern use of computers in the design, analysis and manufacture of hydraulic turbine runners.** McNabb, J.Y. (Dominion Engineering Works Ltd., Montreal, Quebec). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Hydraulic turbines are highly efficient machines. Much of that depends upon being able to properly design and accurately manufacture the runner. Recent developments in the use of computers have revolutionized the way these tasks are performed and the quality of the resulting product. A description is given of a system of computer programs which have been developed to efficiently perform the following tasks: interactive graphics blade design, finite element 3-dimensional fluid flow analysis, 3-dimensional structural stress analysis, 5-axis N.C. machining of both model and full-sized runner blades.

30163 (TVA/PUB—84/21b, pp 881-890) **Jonghua Dam Project.** Cheng, R.Y.; Hsu, R.L.; Chen, C.C. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The 82 m high Jonghua Dam is originally designed for silt control as a part of the Integrated Soil Conservation Plan for the Shihmen Reservoir. However, due to the abundance of the stream flow and the steep slope of the river bed at the damsite, it was found that it would be very beneficial to include hydropower generation as one of the functions of the project. The results of a financial analysis showed that the loans to be incurred to finance this project could be repaid over a short period of 12 years. Implementation of the Jonghua Dam Project has not only brought about the maximum exploitation of water resources but also will ensure the provision of a reliable source of revenue which may be used to finance the soil conservation work of the catchment area of a reservoir.

30164 (TVA/PUB—84/21b, pp 892-897) **Hoover Powerplant uprating.** Hamann, B.D. (Bureau of Reclamation, Boulder City, NV). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Hoover Dam is located on the Colorado River about 35 miles southeast of Las Vegas, Nevada. The first of the 17 generators began commercial operation in 1936. Since the plant is approaching the half century point in age, much equipment is in need of major rehabilitation. Analysis indicates that the plant can be rehabilitated and uprated from the original nameplate capacity of 1,344,000 kilowatts (kW) to about 1,818,000 kW with a replacement cost component of about $49,000,000 and an uprating cost component of about $47,000,000 for a total of about $96,000,000. The new capacity would be used for power system peaking, thereby displacing combustion turbine fuels. Obtaining the uprating - that is, capital investment - funds will require legislation and resolution of certain issues of entitlement to the Hoover resource.

30165 (TVA/PUB—84/21b, pp 898-903) **Feasibility of turbine modernization at TVA's Pickwick Landing Project.** Adams, J.S. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The advancement of hydro turbine technology has made it financially attractive in some cases to replace older turbine runners, even before the end of their useful lives, with new more efficient and powerful machinery. An example of a plant which has excellent potential for modernization is the Pickwick Landing Project owned by the Tennessee Valley Authority. Located on the Tennessee River in Hardin County, Tennessee, it is a multipurpose project which includes a powerhouse containing six hydroelectric generating units. The total generator nameplate capacity is 220,040 kW. Although the six units are identical in size, units 1 through 4 were installed between 1938 and 1942, while units 5 and 6 were installed in 1952 and have runners of more modern design. Field tests of the newer units showed turbine outputs approximately 15% greater than the older units. Turbine performance data obtained from turbine manufacturers for potential replacement runners indicated that significant gains in capacity and energy were indeed possible for units 1 through 4. Units 5 and 6 do not appear to warrant renovation at this time. For use in the investigation of the feasibility of runner replacement, a computer model was developed to simulate the plants power production before and after turbine modernization. It was estimated that new runners would increase the effective plant capability by about 18 MW and the average annual generation by about 100,000 MWh. The total project cost attributable to replacing the turbine runners was estimated to the $16.3 million in present worth 1986 dollars. Benefits from the expected additional power generation were valued between $39.8 million and $69.6 million in present worth 1986 dollars, based on various economic forecasts.

30166 (TVA/PUB—84/21b, pp 904-911) **Chief Joseph 1-16 uprate and modernization.** Bryan, K.A. (Army Corps of Engineers, Portland, OR). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The first 16 generating units and associated major electrical equipment at Chief Joseph Dam are currently being uprated and modernized. This program is being undertaken to utilize the additional energy available due to increasing the power pool elevation and to meet the Northwest Power Pool system requirements. The different alternatives examined in the modernization/uprating process and a brief overview of the final approach taken are looked at. In particular the generators, governors, transformers, main unit exciters, power circuit breakers and station service generators are discussed along with the methods used for completing the work in as short a time as possible.

30167 (TVA/PUB—84/21b, pp 912-920) **Renovation of the Lloyd Shoals hydro excitation system.** Schaefer, R.C.; Meissel, S.M. (Basler Electric, Highland, IL). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A renovation project involving the excitation system used in an early built hydroelectric generating plant is discussed. Various approaches for restoring and upgrading the faulty excitation system are reviewed. First, an examination is made of the different types of exciters and their characteristics. Secondly, a review is made of the equipment cost, reliability, maintenance, and projected long range cost savings between systems. Finally, the numerous benefits that were achieved upon the installation of the solid state static excitation systems are outlined.

30168 (TVA/PUB—84/21b, pp 921-930) **Underwater explosives detonations and structural responses, Guri Hydro Project, Venezuela.** Oriard, L.L. (Lewis L. Oriard, Inc., Huntington Beach, CA). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Completion of the 10-unit first-stage powerhouse at Guri Dam, Venezuela, required the removal of a large pinnacle of rock which remained in the river bed under 70 ft. of water directly in front of the powerhouse walls at the location of the last three generating units. It had been assumed originally that explosives could not be used for removing the pinnacle because underwater shock pressures would greatly exceed the static pressures the powerhouse was designed to withstand. Consequently, a plan had been developed for rock removal by mechanical methods. However, as the mechanical work began, it became evident that mechanical rock removal would be far more difficult than originally assumed, that the time estimate of 3 to 3 1/2 years to remove the rock mechanically would be exceeded greatly, and that it might even prove impossible in this depth of water, in which visibility was near zero. The feasibility of using explosives was assessed and, a plan which would remove the rock while leaving the powerhouse undamaged was developed. Considering the cost of lost electrical revenues for an indeterminate number of years, it was deemed essential that a full assessment should be made of the feasibility of using explosives. The plan and its implementation are discussed.

30169 (TVA/PUB—84/21b, pp 931-940) **Rehabilitation of TVA's Ocoee No. 2 Project.** Buttrey, H.C. (Tennessee Valley Authority, Knoxville). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

TVA's Ocoee No. 2 Project is a minimum reservoir, high head operation, consisting of a timber crib dam, a forebay siphon spillway section, and nearly five miles of open wooden flume connecting to its powerhouse. The project contains several unique and historical features. The wooden flumes is believed to be the largest such structure in the country and one of the oldest. The siphon spillway, a European invention, is believed to have made its debut in America at Ocoee No. 2. Power generation was suspended in 1976 due to deterioration of several steel and concrete trestles supporting portions of the wooden flume. Other deterioration included portions of the flume and the downstream face of the timber crib dam. Several alternatives were subsequently studied for rehabilitating the project. These studies resulted in a decision to replace several badly deteriorated steel and concrete trestles, strengthening the wood crib dam, and replacing the entire 4.6-mile wooden flume. The recreational potential of the river is also discussed. When water is not diverted through the flume, it is spilled over the wood crib dam, creating a premier whitewater recreation stream. In order to allow recreational use of the river, a decision was made to interrupt power generation and divert flow down the river for approximately 82 days a year.

30170 (TVA/PUB—84/21b, pp 941-948) **Simulation of the Niagara Hydroelectric Project.** Dowler, C.; Gosset, C.; Hamill, T. (New York Power Authority). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The development of a simulation model for a large hydroelectric plant, the Niagara Power Project, is described. The Niagara Project is operated as a combined run of river and pumped storage system, so the simulation must incorporate both of these operating modes. Hydrology, hydraulics, generation, and plant operations are simulated with a new computer model and used to determine changes in energy production resulting from proposed changes at the Project.

30171 (TVA/PUB—84/21b, pp 949-958) **Multiple use issues and the reactivation of former hydro plants.** Kauffman, J. (Norris and May, Inc., Ann Arbor, MI). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Many proposed hydro projects involve former hydro plants and impoundments presently used for recreation, lake level maintenance, water supply or flood control. Conflicts between hydro project developers and other users of a dam or water resource may arise and result in costly delays, or in extreme cases, abandonment of hydro projects. However, some developers have been able to successfully accommodate existing or proposed uses into hydro plant design and operation. Case studies are used to demonstrate how multiple uses can be accommodated into the design and operation of hydroelectric facilities. Historical background is used to provide insight into the development and resolution of environmental conflicts.

30172 (TVA/PUB—84/21b, pp 959-966) **New technology for modernization of existing hydraulic turbines.** Itoh, H. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The modernization and the rehabilitation of the existing hydraulic turbines are one of the most effective means to produce the additional electric power in the shortest possible time. The rehabilitation of the existing units has only been thought of as the recovery to the original turbine conditions. It is clear that the upgrading, such as the improvement of the performance, function, reliability and the easy maintenance, is required. The endeavors for the hydro-engineering developments and their applications of the new techniques are discussed.

30173 (TVA/PUB—84/21b, pp 967-975) **Increasing the capabilities of hydroelectric systems.** Wall, R.L. (General Electric Co., Schenectady, NY). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Considerable attention is being directed toward increasing hydroelectric generating capacity by installing generating equipment at existing water control dams, developing new dams and restoring old sites. This is as it should be, but uprating existing systems should play an important role in increasing total hydroelectric generating capacity. Increasing the capability of an existing hydroelectric system means increasing its capacity to generate electrical energy above the original design. It can also mean restoring the capacity of a system to its original level after it has deteriorated due to inadequate maintenance. The equipment changes necessary to accomplish either of these objectives generally produce the added benefits of improved reliability and decreased operating and maintenance costs.

30174 (TVA/PUB—84/21b, pp 976-985) **Conversion of mechanical governors to electrical governors.** Elliott, J.M. (Woodward Governor Co., Rockford, IL). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Mechanical hydraulic governors manufactured by Woodward for the purpose of controlling water driven turbines, where properly maintained, are operating equally as well today as when they were first installed. Due to new technology, especially in solid state devices, changes in methods of operation, and requirements from the utilities, there is often a need for changes in the capabilities of governing equipment. Electric hydraulic governors are not necessarily essential for all governor applications. The operating requirements include the capability for the governor to respond to actual power output of the generator (referred to as load feedback), quicker response for better stability during synchronization and the ability of regulating station joint load control. When a mechanical hydraulic governor is converted to an electrical hydraulic governor, usually only a small portion of the existing governor necessitates replacing. To minimize the actual down time for converting the governing equipment, it is essential for all parties concerned to be well versed in the desired operating requirements for a given project. Through coordination and proper planning, the governor conversion can usually be accomplished with ease. Normally, governors for hydro turbines are specifically designed and custom built to meet the requirements for a particular project. Therefore, to effectively conduct an accurate cost analysis for conversion of an existing governor, one must carefully review all facets of operation. As can be imagined, the more elaborate the control requirements, the greater the dollar cost.

30175 (TVA/PUB—84/21b, pp 986-996) **Case studies in hydroelectric turbine rehabilitation.** Ernst, L.R. (Allis-Chalmers Corp., York, PA). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Rehabilitating hydroelectric generating equipment will maintain high performance and, in many cases, can increase energy output. The energy output of existing hydraulic turbines can be increased by applying modern technology and materials to upgrade performance. The generator performance can frequently be improved as well. Some of the benefits of repair and rehabilitation are: 1) increasing the output and/or efficiency of the turbine and generator; 2) reducing equipment downtime, both planned and unplanned; 3) extending the service life of existing hydraulic turbine and generator; 4) reducing detrimental operating characteristics such as vibration and cavitation; 5) correcting mechanical problems that could potentially result in a catastrophic failure; 6) quickly repairing damaged units; and 7) restoring abandoned units to produce power. Several typical rehabilitation projects performed by Allis-Chalmers are examined.

30176 (TVA/PUB—84/21b, pp 998-1005) **Computer control and optimization of an industrial hydro-electric system.** Firlotte, P.I.; Cuddy, M.J.; Ziegler, J.E. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Great Northern Paper Company owns and operates a multiplant hydro-electric system on the West Branch of Maine's Penobscot River. The system consists of 19 dams with a combined storage capacity of 58 billion cubic feet. Six of the dams include hydroelectric generating facilities with installed capacity of 114 MW. About 700,000 MW/yr. of base load power is produced for Great Northern's Millinocket and East Millinocket paper mills. In 1980 Great Northern undertook the design and construction of a computer control system for its' hydro-electric plants. The six plants contain a total of 31 generating units. Francis, Kaplan and fixed blade propeller units are included in the system. To implement the project, Great Northern chose to put together a team of its employees and outside consultants to select and purchase the hardware and design the software for the system. Control is accomplished through a network of Digital Equipment Company (DEC) computers (nine are used in total) operating on the bias adjustment of existing generator governors and voltage regulators. The computer system allows a single centrally located power dispatcher to operate and optimize the performance of the six unmanned stations, covering a 60 mile reach of the river. A unique feature of the system is that the flow of water through each turbine is measured directly, as is the power output of the generators. Thus, machine efficiency can be monitored directly, without use of inferential data. The use of machine efficiency curves and optimization by equal derivatives allows the computer to insure that the power output for each station is the maximum possible for the water flow specified. The system also monitors the electrical production of six high pressure steam turbogenerators (both condensing and reducing), located in two steam plants separated by eight miles. A utility tie is also monitored.

30177 (TVA/PUB—84/21b, pp 1006-1015) **Computer modeling of network of reservoirs and hydroelectric plants.** Sarkar, C.K. (Chas. T. Main, Inc., Boston, MA). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A general purpose computer model, HYSM (Hydroelectric Simulation), was described at the Waterpower '81 Conference under the title "Mathematical Modeling and Computer Simulation of Cascading System of Hydroelectric Plants." Its original modeling capability was limited to ten cascading reservoirs/plants located on the same river, each plant having not more than ten generating units. Since then the computational procedures of HYSM have been refined and its features and capability greatly enhanced to include simulation of a basin wide network of plants and multipurpose reservoirs with or without hydroelectric generation. During the past two and half years HYSM found extensive applications to a large number of hydroelectric projects of diverse nature, complexities, and requirements in this country and abroad resulting in better and more accurate conclusions with significant savings in time and cost. The enhanced capabilities of HYSM and its applications to four projects of diverse nature, two domestic and two foreign are described.

30178 (TVA/PUB—84/21b, pp 1016-1025) **Experiences with a mathematical hydropower representation.** Giles, J.E.; Wunderlich, W.O. (Tennessee Valley Authority, Norris). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The development of operating or planning strategies for a power system requires an accurate mathematical representation of its principal components. A power system dominated by thermal units with hydro units contributing toward peak-load reduction is a common configuration and is the basis for the hydropower representation given. A realistic representation of such a hydrothermal power system requires accurate modeling of its physical, economic, and probabilistic aspects. Relationships based on physical laws and empirical data are used to characterize hydro unit performance, such as power output and turbine discharge versus gross head, and thermal unit performance, such as conversion of heat energy to electrical energy versus unit capacity level. Economic considerations, such as fuel cost per increment of heat energy versus heat energy, are usually based on operational experience and projections. A major consideration is the uncertainty about inflow, unit availability, and power demand inherent in power systems operation. Modeling these elements forms the integral part of a procedure for evaluating the hydrothermal system operation cost for a given hydro system schedule. This procedure serves as the hydropower representation in reservoir system scheduling models. The procedure described has been shown to be an efficient, reasonably accurate model for a large hydrothermal power system. It is presently being used as part of a weekly time-step model that aids in planning and scheduling hydropower operations. Experiences with the development and use of this hydropower representation will be discussed.

30179 (TVA/PUB—84/21b, pp 1026-1035) **Forecasting flow for hydroelectric operations.** Crawford, N.H. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Operating hydroelectric facilities where reservoir storage is available requires decisions on the use of stored energy. More energy can be produced now limiting later production, or less energy can be produced now so that more energy will be available later. Evaluation of the timing of use of stored energy requires data on current generation costs, forecasts of the value of generation in future, and forecasts of future streamflows. The full range of future streamflows needs to be considered: an optimal use of storage for one particular streamflow forecast is not sufficient. Methods for calculation of optimal use of stored energy that consider uncertainty in streamflow forecasts by using the expected value of future streamflows are outlined. Computer based graphics are used to allow system managers to see the sensitivity of the selected hydro operating levels to the basic data and forecasts used the analysis.

30180 (TVA/PUB—84/21b, pp 1036-1045) **TVA's weekly scheduling model: overview and implementation.** Shane, R.M.; Boston, W.T. (Tennessee Valley Authority, Norris). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The TVA weekly scheduling model is an operational planning model designed to model week-to-week variations in water level, discharge and electrical generation at TVA operated reservoirs. Since the model was first introduced into actual operations by the Office of Power in 1980, it has been used heavily for 1) evaluation of operational impacts to be expected from proposed contractual and operating policy changes, 2) forecasting of hydro system energy utilization and energy-in-storage, and 3) quarterly calculations of hydro system economy guides. Flexibility provided by the model to easily eliminate objectives, add objectives, change the priority of objectives, model the system using any portion of a continuous hydrologic record of inflows beginning in 1903, and then examine operating data using interactive computer graphics has proven to be of great value to Office of Power personnel in all applications.

30181 (TVA/PUB—84/21b, pp 1046-1055) **Indexed sequential modeling of hydropower system operations.** House, P.M.; Ungvari, J.L. (Western Area Power Administration, Golden, CO). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Indexed Sequential Modeling (ISM) is essentially a simulation of hydropower system operations under all water conditions within an extended historical period that allows probabilisitic analysis of hydropower generation. This modeling approach is currently being used on a selective basis by both the Department of Energy's Western Area Power Administration (Western) and the Department of Interior's Bureau of Reclamation (BuRec) for determining marketable power associated with the Colorado River hydropower system. In principle, the ISM statistical analysis approach is applicable to any river basin system. Western's application of the ISM approach to the Central Valley Project (CVP), a Federal hydropower system in California is discussed. This application consisted of three basic tasks: 1) development of two water operations studies to form the hydrologic data base to be used in the ISM model; 2) modification of Western's existing CVP power generation model for application of the ISM approach; and 3) performing ISM computer runs and analyzing results. Each of these tasks is described. The results of the ISM approach as applied to the CVP were determination of a set of monthly ranges of CVP power outputs and derived probability curves. These results can be used for power marketing and other planning purposes and could represent a basis for marketing additional reliable capacity from the CVP Federal hydropower system. Western's overall conclusion based on its CVP studies is that the ISM approach is technically applicable to the CVP hydropower system for making capacity and energy planning computations that could be used in developing its future power marketing plans.

30182 (TVA/PUB—84/21b, pp 1056-1065) **Computerized optimization of cascading hydropower stations.** Restrepo, P.J.; Goff, K.A. (Stone and Webster Engineering Corp., Boston, MA). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The small power stations that dominate today's hydroelectric development program in the US are inherently expensive. In the project evaluation process every effort must be made to assess site capacity to determine the maximum power potential of the available head and flow conditions. The evaluation must be essentially the same for an older station undergoing relicensing. Owners must carefully examine a plant's installed capacity and the full energy potential available in the water resource to ensure that it is most efficiently and economically utilized. Factors that influence the energy generation potential of a plant are: 1) equipment selected for new projects or installed in older plant; 2) minimum flow release requirements; 3) operating rules; and 4) the type of plant (e.g., whether a run-of-river facility has ponding capability or a large storage capacity). The owner-developer must explore every generation alternative in the evaluation and development process. The methods and computer tools being used to ensure that available water resources are used most efficiently at project sites being developed, rehabilitated, or relicensed are described.

30183 (TVA/PUB—84/21b, pp 1066-1074) **Re-regulating storage in water supply-hydroelectric projects.** Neill, G.V.; Henderson, D.I. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The benefits of a hydropower facility integrated in a municipal water supply system can be increased by including re-regulating storage. Both the amount and the value of the energy produced are increased. Re-regulating storage allows the hydropower to be used as high value peaking capacity while maintaining the integrity and operation of the water supply system. Recent experience is discussed and the design and analysis procedure of an integrated water supply-water power development are described. The constraints, design optimization, and benefits of the integrated facility with re-regulating storage are discussed.

30184 (TVA/PUB—84/21b, pp 1075-1082) **Automation of small scale hydroelectric generating plants.** Bergseng, J. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

For economic operation of small hydroelectrics, a high level of automation is frequently used. Rising labor costs mean that inspection must be kept to a minimum. Local conditions - such as availability of personnel, access to the power plant, the size of its reservoir, its importance as grid supplier - all influence the degree of automation. Protection is not to be taken as a part of automation. Protection must put the station in a safe condition when a fault is present. Normally, this will entail bringing the power plant to a standstill. Protection is therefore a functionally independent system and is not considered.

30185 (TVA/PUB—84/21b, pp 1083-1092) **Acoustic flowmeters for hydro-turbine efficiency measurement.** Lowell, F.C. Jr.; Dube, L. (Ferranti O.R.E., Inc., Falmouth, MA). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

On-line, real time efficiency measurement of hydroelectric turbine generators has been accomplished using an integrated system which combines a multipath acoustic flowmeter installed in several turbine penstocks, pressure sensors and power meter. Results include relative efficiency of two units compared to the thermodynamic method and model test data.

30186 (TVA/PUB—84/21b, pp 1093-1099) **Economical control of hydroelectric plants.** Butz, H.; Lund, K.; Radvani, T. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Hydroelectric plants benefit substantially from modern control techniques and equipment. Some of the ways computer control systems maximize profits in hydroelectric plants are described. Modern control systems include some programmable control devices. The use of programmable controllers or computers on small scale hydro projects is required to optimize profitability. The use of a modular intelligent controller makes upward and downward expansion possible. With this expansion, cost saving control features can be implemented. Additionally, replacing other equipment, minimizing labor, simplifying installation, and developing a control hierarchy are also discussed.

30187 (TVA/PUB—84/21b, pp 1100-1108) **Missouri River Power Plants Control System.** Trout, J.E. (Corps of Engineers, Omaha, NE). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Missouri River Power Plants Control System (MRPPCS) is a computer based supervisory control and data acquisition system for controlling six hydro-electric power plants on the upper Missouri River. The system will consist of a master control station designated Regional Hydropower Action Center (REHAC) and six Power Plant Control Systems (PPCS). The power plants are spread over 3 states (South Dakota, North Dakota, and Montana) and 700 miles of the upper Missouri River. Total generation capacity of the six power plants is 2429MW.

30188 (TVA/PUB—84/21b, pp 1109-1118) **Special features of cascade operation of Chibro and Khodri Power Stations on the Yamuna River in India.** Agrawal, T.C.; Rikh, V.N.; Gupta, A.K.; Tandon, G.L. (Hydro Electric Projects, Dehradun, India). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The scheme consists of an underground hydropower station at Chibro (4 x 60 MW) which receives water through a 6.2-km-long pressure tunnel from the headworks at Ichari on the Tons River (a tributary of the Yamuna River) and discharges the same into a collection gallery from where another pressure tunnel of 6 km in length takes off for feeding a surface power station at Khodri (4 x 30 MW), with its tailrace discharging water back into the Yamuna River. The scheme is unique because of insignificant storage available in the collection gallery being equivalent to less than two minutes of full load discharge of Khodri. This has caused a very challenging problem of keeping the collection gallery level practically constant not only during steady-state operating conditions but also during sudden load rejection/acceptance due to tripping of machines or system disturbances. The narrow margin of the operating level available in the collection gallery requires complete matching of water flow between two power stations connected by a long closed water conductor system almost instant by instant. Any excess water drawn by the downstream power station will result in a fall of the collection gallery level of an upstream power station which, if not arrested, will result in air entering the headrace tunnel of Khodri with possible danger to tunnel lining and hydro turbines. Likewise, if the downstream power station draws less water than that released by the upstream power station, it will result in spilling of water from the Chibro collection gallery, causing generation loss. A scheme was devised for the operation of these two power stations in tandem which incorporates special constructional and control features. Various challenging problems anticipated in this unique scheme are described along with their solutions.

30189 (TVA/PUB—84/21b, pp 1119-1128) **Optimizing operating efficiency at Hoover Powerplant.** Stitt, S.C. (Bureau of Reclamation, Denver, CO). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Plant efficiency gains that could be realized at Hoover Powerplant by the use of an algorithm to optimize plant efficiency are given. Comparisons are shown between the present plant operating conditions modeled on a digital computer, and the plant with the proposed unified bus operating under control of a GELA (Generator Efficiency Loading Algorithm) system. The basic concepts of that algorithm are given.

30190 (TVA/PUB—84/21b, pp 1129-1139) **Optimizing frequency regulation of isolated hydroelectric projects.** Carson, P.T. (R.W. Beck and Associates, Seattle, WA). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Completion of the 22.5-MW Swan Lake Hydroelectric Project near Ketchikan, Alaska will result in the isolated Ketchikan area electrical system being supplied on a regular basis only from hydroelectric power stations. The frequency regulating characteristics of the existing system's hydroelectric units is very poor. Therefore, the decision was made during the Swan Lake Project design to improve its frequency regulation capabilities to enhance the combined system's performance. Minimum levels of regulation performance as required by the system's loads and as recommended by NEMA standard HT4-1958 were selected as goals in the work. Five alternatives for achieving this were considered and compared using a programmable calculator model to predict the project's frequency vs. time performance. To confirm the selected group of alternatives and to predict the ultimate system frequency regulation, an analog computer model was utilized to simulate the combined operation of the four hydroelectric plants which will comprise the system. A comparison of the actual regulating characteristics and the predicted values for a similar project constructed in 1982 are presented. Difficulties overcome during this project's startup and initial operation which affected its frequency regulation are discussed.

30191 (TVA/PUB—84/21b, pp 1140-1148) **Equipment selection and operation policy aided by micro-computer.** Wood, D.W.; Turner, H. Jr.; Horn, D.R. (Anderson-Nichols and Company, Inc., Boston, MA). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Two large dams in series on the West Branch Farmington River in Connecticut are under design to be retrofitted for hydropower. The dams built for water supply, flood control, and low flow augmentation have a complex set of operating constraints, and the headwater of the lower dam is the tail water of the upper dam. The selection of turbines was dependent on the assumptions made for operating policy of the two dams. In order to conveniently test various combinations of equipment and operating policy, a power generation simulation model was developed on a micro-computer. The potential for using the model as a decision support system to aid in the scheduling of releases is also under consideration.

30192 (TVA/PUB—84/21c, pp 1355-1365) **EPRI's hydro R and D program.** Sullivan, C.; Birk, J.; Ferreira, T. (Electric Power Research Institute, Palo Alto, CA). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Hydroelectric power development and improvement have been receiving increased attention due to the increasing value of electricity and importance of renewable energy. In 1981 EPRI established a research program focused on small-hydro cost reduction and incremental performance improvement of large hydro. The current needs as specified by the industry are to: establish causes and methods for reducing forced outages, reduce frequency of scheduled outages, improve new equipment availability/reliability, reduce environmental and safety concerns at minimum cost, develop a low cost modular component package for small hydro and, specify planning procedures that recognize load following, system regulation and spinning reserve. Key research projects currently underway to address these needs are: evaluating cavitation problems and repair procedures, developing diagnostic tools for assessing turbine and generator status, developing and demonstrating cost effective modular small hydro equipment packages, publishing a complete series of practical manuals on hydroelectric generation, and assisting in the publication of a North American periodical on hydroelectric generation.

30193 (TVA/PUB—84/21c, pp 1386-1393) **St. Anthony Falls Hydraulic Laboratory turbine test facility.** Wetzel, J.M.; Arndt, R.E.A.; Bintz, D.W. (Univ. of Minnesota, Minneapolis). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

With the renewed interest in low head hydropower, attention is naturally directed towards the development of small, low cost turbines. The major turbine manufacturers have recognized this need, and several smaller suppliers have also been stimulated to introduce new products. A turbine test stand to be used for testing model hydroturbine units and for more basic hydroturbine research is presently being installed at the Laboratory as a permanent facility. The facility is scheduled for completion shortly and will be the only independent turbine test facility in the US available for sponsored studies. The facility consists of a closed test loop with a 300 HP main pump and motor. The arrangement of the head and tail-tanks will accommodate a variety of turbine configurations. A 100 HP dynamometer is available, and the test loop is designed for testing either pumps or turbines. Pressure control is provided to permit testing under cavitation conditions. The facility will make use of the Laboratory's computer system for data processing. It is anticipated that potential uses of the facility will include research on new turbine concepts, intake and outlet design, model tests for small manufacturers, cooperative research with turbine manufacturers, acceptance tests, and the training of hydropower engineers. The availability of the facility for conducting basic research with results published in the open literature is considered unique, and complements the Laboratory's extensive experience in cavitation research and other related areas in hydropower development.

30194 (TVA/PUB—84/21c, pp 1394-1402) **Optimization of a diffuse/ejector for ultra low-head systems.** Moses, H.L.; Siegel, R.P.; Brown, E.F. (Virginia Polytechnic Institute and State Univ., Blacksburg). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

An investigation of head augmentation for ultra low-head hydroelectric systems by use of an ejector in the diffuser, or draft tube, is described. A detailed analytical and experimental study of flow in the ejector, which consisted of a conical diffuser with a peripheral wall jet, was conducted. Based on these results, an overall system analysis was developed and compared with experimental results from a small, axial-flow turbine. Finally, a brief economic analysis was made to determine the advantage, if any, of the ejector system.

30195 (TVA/PUB—84/21c, pp 1403-1407) **New approach to ULH development using the cross-flow turbine.** Johnson, W.F.; Ely, R. III; White, F. (New Found Power Co., Inc., Hope Valley, RI). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A Cooperative Research Program funded jointly by New Found Power Co. of Hope Valley, RI and the DOE Idaho Operations Office in 1980-81 resulted in both an optimized geometry for ultra-low-head turbines of the Cross-flow (or Mitchell-Banki) type and low cost construction materials and techniques. Model tests were performed on a wide variety of possible nozzle shapes at the University of Rhode Island Hydraulics Lab. Tests were performed to confirm the applicability of draft tubes to the Cross-flow turbine. Results of the tests are presented.

30196 (TVA/PUB—84/21c, pp 1418-1427) **Pump station conversion.** Stern, P.S. (Colorado Project/TIP, Inc., Boulder). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The feasibility of converting an existing pump station to reversible power generation in the water distribution system of the City of Boulder, Colorado was studied. Two pumping stations in the eastern most portion of the City's water system remain idle a good portion of the year with water flowing by them from the main gravity system. During the summer months, the stations are used to pump treated water from a secondary source into the system. Water flows averaged 1.7 to 3.5 cfs past the pumps during off-season. Sufficient flow exists to convert one of the three 125 hp pumps at one of the stations for power generation. Approximately $10,000 is required to convert the existing pump for reversible operation equivalent to a 58KW turbine capable of generating approximately 140,0000 KW-hours annually. Power would be sold to Public Service Company of Colorado. Conversion consists of minor modifications to existing equipment and the addition of some simple electronic gear. A demonstration project in conjunction with the local school district is considered due to the close proximity of the station to an existing education facility.

30197 (TVA/PUB—84/21c, pp 1428-1437) **Cherepnov water lifter - a direct use of hydropower to pump water.** Liu, H.; Fessehaye, M.; Geekie, R. (Univ. of Missouri, Columbia). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Under the sponsorship of the US Department of Energy, the University of Missouri, Columbia has recently completed research to assess and develop the Cherepnov water lifter for use at hydropower sites - especially low-head sites. The Cherepnov lifter is a simple device that extracts the potential energy of water to lift or pump water without having to convert the extracted energy into electricity. As a result, water can be pumped at a cost lower than that of using conventional pumps driven by electrical motors or diesel engines. Economical use of the lifter is not limited to remote locations or developing nations.

30198 (TVA/PUB—84/21c, pp 1438-1446) **Hydrogen production at low-head hydropower plants.** Tarnay, D.S. (Federal Energy Regulatory Commission, Washington, DC). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The technical and economical feasibility of the conversion of water to hydrogen at low-head hydropower plants and then conversion of hydrogen to electricity via a gas turbine is evaluated. The energy produced in the off-peak or no-demand time, and in time of huge river flows, can be stored in the form of hydrogen, and later, when the on-peak energy is needed, the hydrogen converted to electricity. One of the advantages of this system is that the resource for production of hydrogen - water - is available at the site. It appears that the conversion of waterpower energy at low-head hydropower plants to hydrogen, and its utilization directly at the site, is technically and economically feasible and would improve the economy of the project.

30199 (TVA/PUB—84/21c, pp 1447-1456) **Advanced computerized technique for hydraulic design and optimization of turbines.** Chacour, S.A.; Fisher, R.K.; Colwill, W.H. (Allis-Chalmers Fluid Products Co., York, PA). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Significant advances in hydraulic design have occurred over the years for all turbine types. These advances were traditionally the results of a slow process of model test development and evaluation of operational experience. In the 1970's, an incremental gain of 0.2% was typically attained for each redesign. Today, new computerized analysis techniques which have been integrated into a computer-aided design and manufacturing system are predicting accurately the complex behavior of fluid flow and are yielding new designs demonstrating significantly greater improvements in efficiency and cavitation performance. The key elements of this system are discussed and how these elements are integrated to form an effective tool is discussed.

30200 (TVA/PUB—84/21c, pp 1457-1466) **Effect of tailrace geometry on draft tube surging.** Nystrom, J.B.; Bozoian, P.M. (Worcester Polytechnic Institute, MA). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

An experimental investigation was undertaken to determine the effects of tailwater geometry on draft tube pressure fluctuations (surging) due to residual angular momentum (vortex breakdown). A test facility using air as the working fluid was constructed using a multi-vane swirl generator to simulate the turbine at off-peak operating conditions. Several simplified geometry draft tubes and a model of an actual draft tube were tested. Tailrace geometry was found to affect neither the magnitude nor the frequency of the pressure fluctuations when the Reynolds number was above a critical value and the ratio of the surge frequency to the first harmonic of the natural frequency of the system was much less than 1. For surge frequencies approaching the natural frequency, the magnitude of the pressure fluctuation was amplified, but the frequency was unaffected. Investigation of the frequency response of the system indicated that the tailrace geometry affected the system response. Likewise, the upstream boundary condition, the swirl generator setting, had an effect on the system response. Modeling criteria were established to predict the effects of resonance due to scale and working fluid. It was shown that models using air cannot correctly simulate the effects of resonance and surging simultaneously for prototype systems using water.

30201 (TVA/PUB—84/21c, pp 1467-1471) **Model development of energy dissipator for Howell-Bunger valve.** Rudavsky, A.B. (Hydro Research Science, Santa Clara, CA). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The development of an energy dissipator for a Howell-Bunger (H-B) valve is described. The H-B valve is a critical component in many hydroelectric power plants. This study is based on a recent project conducted by Hydro Research Science to optimize the hydraulic effectiveness of several key components of the proposed outlet works for a hydroelectric project in California. One of those components was an H-B valve's energy dissipator, which was required to operate satisfactorily under the project's power-generation operational mode. The course of the experimental program, which produced an effective H-B valve energy dissipator, is outlined. A 1:24 scale model of the H-B valve energy dissipator, the plenum structure, and the power take-off conduit was subjected to anticipated hydraulic conditions. A major objective of the test program was to reduce the high-velocity jet leaving the H-B valve. The types of structural modifications that can be introduced to alleviate turbulent outflow conditions in the exit area are reviewed. Based on the test program, the practicality of model-aired design as an engineering technique to assist project planners is presented.

30202 (TVA/PUB—84/21c, pp 1472-1483) **Guidelines for intake without free surface vortices.** Gulliver, J.S.; Rindels, A.; Lindblom, K.C. (Univ. of Minnesota, Minneapolis). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Free surface vortices at plant intake can cause excessive vibration, efficiency loss, structural damage, and flow reduction in hydroelectric facilities. They can also be a safety hazard and a potential loss of life. One of the major problems encountered during intake design is the specification of submergence and other design parameters in order to avoid strong free surface vortex formation. In order to assist in preliminary intake design, a plot of dimensionless submergence versus intake Froude number is presented for a number of vertical and horizontal intakes from both field and laboratory observations. The pilot is divided into two regions: (1) a region where intake vortices are unlikely and a model study is not required except with extremely poor approach conditions, and (2) a region with a good possibility of intake vortices, and a model study is recommended. Region 2, where intake vortices are a good possibility, is very large, encompassing many hydropower facilities. This is because minimum intake submergence to avoid vortex formation is highly dependent upon approach conditions, which are site specific. An experimental study was undertaken which focused upon typical intake approach conditions. Most hydropower intakes have a forebay to avoid high circulation near the intake, so the experimental study simulated approach conditions with a forebay or approach channel of varying length and width.

1304 Regulations And Licensing

REFER ALSO TO CITATION(S) 30094, 30106, 30213

30203 (CONF-7907129—, pp 111-122) **Federal jurisdiction in the development of small-scale hydro.** Corso, R.A. (Federal Energy Regulatory Commission, Washington, DC). May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

The role of the federal government in regulating the development of small-scale hydroelectric resources is discussed. These regulatory powers are administered by the Federal Energy Regulatory Commission (FERC). It is the objective of the FERC to assure that the burden of obtaining a federal license is not time consuming or costly.

30204 (CONF-7907129—, pp 145-148) **Outline of basic issues in small scale hydroelectric development.** Brown, P.W. (Energy Law Institute, Concord, NH). May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

An outline is presented that sets forth in brief form the major federal and state regulatory issues and institutional, economic and environmental problems confronting small dam development in the Northeastern US. For a fuller treatment of these issues the reader should consult the various reports of the Energy Law Institute of Franklin Pierce Law Center on small scale hydroelectric power.

30205 (TVA/PUB—84/21a, pp 406-414) **FERC cases on municipal hydroelectric development.** Olson, R.A. (ELI Corp., Concord, NH). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The rulings of the Federal Energy Regulatory Commission in the area of municipal hydroelectric development are examined. The issues discussed include what constitutes a municipality under the terms of Section 3(7) of the Federal Power Act, hybrid and hidden hybrid applications and their eligibility for the municipal preference under Section 7(a) of the Act and loss of the preference due to technical filing requirements of the Commission.

30206 (TVA/PUB—84/21a, pp 415-423) **Battle for municipal preference.** Angyal, R.S. (Federal Energy Regulatory Commission, Washington, DC). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

As hydropower becomes increasingly attractive, for a variety of reasons, the demand for economically attractive sites has multiplied. The Federal Energy Regulatory Commission determines who gets preliminary permits and licenses for new sites, and who gets licenses when existing ones expire. Because it acts as the tie-breaker, the preference given by the Federal Power Act to municipalities has assumed great importance at both these stages. FERC is taking steps to solve problems that may be caused by hybrid applicants improperly attempting to get the benefit of the preference. FERC also has pending before it the appeal of the first initial decision on relicensing awarding a license on the basis of the preference.

30207 (TVA/PUB—84/21a, pp 424-433) **Law, hydropower development, and the American Indian.** Du Bey, R.A; Schlosser, T.P. (Ziontz, Pirtle, Morisset, Ernstoff & Chestnut, Seattle, WA). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The role of Indian Governments has long been ignored by the federal government in the formulation of national goals and objectives for hydropower development. This has damaged the relationship between Indian tribes and the Government and negatively affected the relationship between Indian tribes and non-federal project proponents. In certain instances the absence of consultation between tribes and hydro project proponents has made it difficult or impossible for hydropower development to take place. In the US, Indian tribes have unique ownership rights in land and water resources which are entitled to special protection. Moreover, the existence of a trust relationship between the Government and Indian tribes imposes a legal duty upon the Government and its administrative agencies to protect these tribal rights against infringement or loss. The role and legal authority of Indian tribes in the US are reviewed and the reasons why Indian tribes should be actively involved in project development and regional and national hydropower policy are discussed. Because of the inherent governmental status of Indian tribes, and their ownership and regulatory authority over important land, water and other resources, it is only logical that tribes be included in such activities. In practice, however, there is an absence of coordination between tribal governments and federal and non-federal project proponents.

30208 (TVA/PUB—84/21a, pp 434-443) **Municipal hydroelectric development: legal and socioeconomic study.** Pill, M.; Schneider, P.; Holzberg, C. 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Under the auspices of a federal grant from the Department of Health and Human Services, New England Energy Development Systems, Inc. (NEEDS) was retained by the Franklin Community Action Corporation (FCAC) in Greenfield, Franklin County, Massachusetts, to conduct a legal and socioeconomic study on municipal hydroelectric development at three existing dams. One dam is in the town of Conway, while the other two are in Greenfield. Since neither of the towns involved had municipal utilities, an important aspect of the study was to evaluate different options for hydro development. These options included: establishing a municipal utility, which would produce, transmit and distribute the electricity generated; developing a municipal system which would sell power to the local private utility; developing a hybrid approach involving both the town and a private entity; and leasing to private developers who would then have sole responsibility for construction and operation of the hydroelectric facility. Legal problems, economic advantages/disadvantages and methods of financing were taken into account in consideration of each option. Computerized pro forma cashflow analyses (developed by NEEDS) were included. Further assessment of the municipal utility option was provided by analyzing a number of interviews conducted with managers of existing Massachusetts municipal utilities, and supplementing these interviews with a review of municipal operating procedures and finances.

30209 (TVA/PUB—84/21b, pp 741-750) **Niagara project expansion.** Kerr, D.M. (New York Power Authority, Niagara Falls). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A description of the plans of the New York Authority to expand their Niagara Power Project is provided. The Authority's approach and organization for licensing the project is discussed.

30210 (TVA/PUB—84/21c, pp 1174-1181) **Mediation: an effective way to settle hydro licensing disputes.** O'Connor, D.L. (New England Environmental Mediation Center, Boston, MA). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Federal Energy Regulatory Commission's licensing of numerous hydropower projects would be faster, simpler and less costly if the Commission could assign independent mediators to devise settlement agreements between hydro developers and intervenors who are concerned with the socio-economic and environmental impacts of the projects. Intervention proceedings caused lengthy delays in the Commission's licensing of hydropower projects. Procedural maneuvering inevitably results in increased project costs and does not always produce enhanced environmental protection. The Commission should take actions which will reduce delays and improve the quality of licensing decisions wherever legally and administratively possible. Two hydro disputes, settled with the help of an independent mediator, illustrate the potential value of mediation in the licensing process. These actions helped avoid costly and adversarial administrative proceedings at the state and federal level. The FERC has embodied settlement agreements in license conditions. The Commission does not have explicit authority in its current regulations to require parties to attempt to settle their differences in these cases. Proposed is that the Commission make certain additions and modifications to its regulations which would allow it to initiate settlement proceedings and assign a mediator to direct them.

1305 Economics And Management

REFER ALSO TO CITATION(S) 30106, 30112, 30147, 30183, 30192, 30367

30211 (CONF-7907129—, pp 67-72) **Some points on economic evaluation of small-scale hydro which should be kept in mind.** English, J.M. (Univ. of California, Los Angeles). May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

Economic evaluation of projects often appears very easy to many engineers. However, appearances are deceptive and a priori assumptions of easiness often are the result of serious misconceptions and lack of awareness of many of the subtleties which should be considered. This short review is made to call attention to some important points. These are: economic or investment evaluation versus financial evaluation, point of view, risk and the discount rate, inflation, and opportunity costs and shadow prices.

30212 (CONF-7907129—, pp 159-162) **Financing low-head hydroelectric projects.** McLeod, H.W. (New England Merchants National Bank, Boston, MA). May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

Methods for financing low-head, small-scale hydroelectric power plants are described. The key components of a successful low-head hydro project financing plan and the sources and types of financing available are discussed.

30213 (CONF-7907129—, pp 163-174) **Hydropower fundamentals.** Mayo, H.A. Jr. (Allis-Chalmers Corp., York, PA). May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

A fundamental background to hydro power in general is presented. More specifically, the US hydro-turbine industry, the market, institutional impacts, industry's current efforts to meet energy needs and potential benefits are discussed.

30214 (CONF-7907129—, pp 175-190) **Low head hydroelectric potential - economics and project development.** Willer, D.C. (Tudor Engineering Co., San Francisco, CA). May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

The economics of small-scale hydroelectric power plants is discussed. Case studies are presented that lead credibility to the feasibility of small hydroelectric power projects. These projects will not totally solve the motion's energy problems but they will permit the utilization of a natural resource that is now going to waste.

30215 (CONF-7907129—, pp 191-202) **Monopsony and the supply of power from small generating stations.** Brown, P.W. (Energy Law Institute, Concord, NH). May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

A private developer of a low-head hydroelectric site basically can only sell his output to two sources: a local municipality or the regional power grid. A municipal power company with power to sell has only one buyer. It is assumed that there is only one purchaser of power in the region, the regulated private utility. This utility is then in the position of a classic monopsony (single buyer), which purchases power from many existing power stations and is the market for any new power station. The advantages and disadvantages of purchasing electricity from outside the utilities generating system are discussed.

30216 (CONF-7907129—, pp 203-212) **Preliminary economic analysis of the value of contributions by small dams to system generation reliability.** Brown, P.W. (Energy Law Institute, Concord, NH). May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

Economists argue that electric rates, or for that matter any rate, for goods and services should reflect the marginal costs of production of those goods or services. In this line, they have described how prices should be set to maximize the sum of consumer and product surpluses (a standard measure of the total benefit to all participants in a given market) in cases where there are varying but cyclical demand patterns. This is the peak load pricing principle. The major result of the peak load pricing principle is that an explicit demand for capacity (fixed capital) was derived. This demand is determined from the cost structure of operating and capacity costs and the separate demands by the consumers in each subperiod (peak and off peak). This demand is for capital actually used during some part of the demand cycle. A framework to determine the value of capital for capacity when that capacity does not necessarily produce electricity, but is in place to assure system reliability is established. It is believed that it is reasonable to view small dams, even with highly varying outputs resulting from stream flow fluctuations, as positively contributive to system reliability. Accordingly, small dams should receive a payment for this good (reliability).

30217 (CONF-7907129—, pp 213-242) **Fundamental economic issues in the development of small scale hydro.** Brown, P.W. (Energy Law Institute, Concord, NH). May 1980. NTIS, PC A11/MF A01. File Number DE84005144.

From UCLA small-scale hydro resources development western regional workshop; Pomona, CA, USA (30 Jul 1979).

Some basic economic issues involved in the development of small-scale hydroelectric power plants (SSH) are discussed. The analysis is based on literature reviews, reviews of some cases studies of SSH projects, on site visits and continual discussion with the members of the Franklin Pierce - Thayer project and others working in the area. Broadly stated, economic analysis to date strongly suggests that the answers to the problem of the present slow rate of development of SSH projects are found in law books and regulatory codes and not in engineering manuals. Further analysis must be performed and additional data collected before the suggestion that legal and regulatory constraints are the major obstacle to SSH development becomes a conclusion.

30218 (TVA/PUB—84/21a, pp 457-467) **Power sales contracts from the developer's perspective.** Campbell, R.H. (Roberts and Shefelman, Seattle, WA). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The various types and provisions of power sales contracts available to the project developer and the circumstances under which each should be used are discussed. Some innovative solutions to the problems inherent in small hydro development of assuring sufficient power sales revenue to pay high front-end capital costs, to make debt service payments and to pay maintenance and operation expenses during low water years, and to provide the developer an adequate return on his investment are also discussed.

30219 (TVA/PUB—84/21a, pp 468-475) **Power purchase contracts: impact on project risks and taxes.** Hough, T.C.; Goodwin, L.M. 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Long-term power purchase contracts are critical to the financial success of non-utility hydroelectric projects. Negotiated contracts can be designed to meet the requirements of the developer better than standard contracts currently available in some states. The value of power is determined by when power is produced, where it is produced and the characteristics of the purchasing utility. The tax planning aspect of power contracts can have a substantial impact on net revenues. The power purchase contract determines the amount and availability of tax benefits. These contracts may be characterized by the IRS as either service contracts, installment sales or leases.

30220 (TVA/PUB—84/21a, pp 476-483) **Financing hydro projects essential ingredients.** Bristol, D.R. 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Today many hydro projects have bridged the licensing and environmental hurdles and are ready to proceed to financing and construction. A view of financing and project development from a private developers standpoint is presented. For the purposes of this discussion, it is assumed that licensing has been completed, environmental problems have been resolved, and that the developer has control of the land required for the development. The purpose is to provide a framework for decision making on financing and construction. Within this framework a concept is presented allowing the developer to make only necessary expenditures commensurate with the risk. To put this process in perspective the need to examine the elements of developing a project and alternative approaches to manage the resources necessary to complete a project are discussed.

30221 (TVA/PUB—84/21a, pp 484-493) **Issues in private development at public hydropower sites.** Wilson, W.H.; Ringo, M.J. (ELI Corp., Concord, NH). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Public entities have the potential to achieve a greater financial return from leasing their sites to private developers. After adjusting for practical problems with state and federal law, the financial market place and prospective private developers, expected financial returns under the two options are roughly equal. Further adjustment for the greater risk of public development shows an advantage in this approach for all but small projects. Care and skill in formulating such agreements is necessary to achieve the true financial potential for the public entity.

30222 (TVA/PUB—84/21a, pp 494-501) **Tailoring PURPA rates to meet the needs of small hydro developers.** Combs, B. (Public Utility Commissioner of Oregon, Salem). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Public Utility Regulatory Policies Act of 1978 requires electric utilities to purchase power from independent, privately owned cogeneration and small power production facilities. The price a utility must pay for power from such facilities is to be equal to the price the utility would have paid to produce the power itself or purchase it from another source. Given this general price guideline, avoided costs can be structured in a variety of ways. For the short term, sales for resale prices may be considered in the avoided cost analysis. For the long term, various levelizing techniques can be used to structure prices. Levelized prices can enable facility sponsors to meet their cash flow needs without causing ratepayers to pay more than they would have paid otherwise over the long term. The effect of several possible levelizing techniques on nominal prices is computed.

30223 (TVA/PUB—84/21a, pp 502-506) **Financing options for hydropower projects.** Hills, A. (Prudential-Bache Securities, Inc., New York, NY). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The increasing cost of fossil-fueled electrical generation, combined with the uncertainties and delays in construction of new central station coal and nuclear power plants, has enhanced the economic feasibility of hydroelectric power projects. As an economic enterprise, the most important characteristic of small-scale hydropower projects is the capital intensive nature of their development. The capital costs for hydropower facilities can generally range from $750 to $2000 or more per kilowatt of installed capacity, depending upon the unique stream flow and geological characteristics of individual sites. In comparison, new coal-fired power plants cost from $900 to $1200 per kilowatt of capacity. This characteristic of hydropower facilities results in high front end costs, although the life cycle cost of the generated electricity can be very competitive with alternative energy sources. Annual project operating costs are likely to be a relatively small portion of total costs, while interest and principal payments on borrowed funds may be equal to 80% or more of annual expenses. The method by which a project will be financed, and at what interest cost, is of primary importance to the economic and financial feasibility of project development. The methods for financing small hydro projects are discussed.

30224 (TVA/PUB—84/21a, pp 507-516) **Project financing for low-head hydro - don't be late for the money.** Jaroch, T.D. (McDermott, Will and Emery, Boston, MA). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Many developers of small hydroelectric facilities focus so much attention on the engineering and construction aspects of their projects that they minimize the kinds of considerations which will later affect their ability to close on their construction/rehabilitation financing. An acceptable power purchase contract is not enough. Most financial institutions will view project financing for low-head hydro from the perspective of a real estate loan. So also will the lawyers responsible for closing such financings, for the financial institution. It is important, therefore, that developers be alert to the documents and other elements which will typically be involved in a project financing. This discussion is not intended to deal with the wide range of possible closing requirements, but rather to focus upon several financing matters which typically have longer lead times and often are troublesome if not addressed early enough. A sample closing checklist is included and should provide a worthwhile overview of requirements for closing on a project financing.

30225 (TVA/PUB—84/21a, pp 517-526) **Recent developments in the taxation of hydropower projects.** Goodwin, L.M. (Goodwin and Schwartzstein, Washington, DC). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Economic Recovery Tax Act of 1981 (ERTA) and the Tax Equity and Fiscal Responsibility Act of 1982 (TEFRA) significantly changed the federal income taxation of businesses and individuals. Many of these changes have had a direct impact on the taxation of hydropower projects. Some changes, such as the acceleration of depreciation deductions, have made hydropower projects and other capital intensive projects more attractive as investments. Other changes, such as the basis adjustment and the at risk rules for the investment and energy tax credits, have had the opposite effect, and could actually make the financing of hydropower projects more difficult. This paper summarizes the tax consequences of investments in hydropower projects in light of these recent changes.

30226 (TVA/PUB—84/21a, pp 527-532) **Small hydroelectric projects as viable business enterprises.** Lystra, D.W. (Ayres, Lewis, Norris and May, Inc., Ann Arbor, MI). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The recent history of small scale hydropower in the US has demonstrated the critical importance of project financing and project management issues. To be successful, small hydro projects must be viable business enterprises. Many sites which have been proved to be technically and environmentally feasible have not had the hoped-for development take place due to the absence of funding or a clear-cut project management program. The successful development of small scale hydropower demands that technical and institutional issues be properly blended with what may be called the entrepreneurial issues of finance and management. Too many site owners, whose attention has been focused on the technical details of equipment, facility design, utility interconnection, etc., have become discouraged when the financial support for the project did not spontaneously materialize. In frustration, many have abandoned their plans for hydroelectric development, or have turned the development rights over to other parties under sometimes unfavorable terms. Two successful small hydro projects are described as case studies to illustrate various ways in which project financing was secured and a managerial entity was created.

30227 (TVA/PUB—84/21a, pp 533-540) **Economic feasibility of small hydropower projects.** Freddolino, D.K.; Sundquist, M.J.; Keats, D.E.; Ross, K.L. (Proaction Institute, East Lansing, MI). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The accurate determination of the economic feasibility of a small hydropower development project can have an important impact on the engineering plans and studies done for a site. Developers are, therefore, finding it increasingly important to examine the financial effects of a variety of development scenarios and to perform appropriate economic analysis to determine if and under what circumstances the development of a site can be profitable. The benefits, flexibility and liability which result from various public and/or private development options are reviewed. The effects of newly enacted tax legislation benefits to be accured from the operation of a small hydroelectric facility and subsequent impact on the financial feasibility of a project are also examined. A case study, demonstrating the use of a financial analysis to examine various options for a joint public/private hydroelectric venture is presented.

30228 (TVA/PUB—84/21a, pp 541-547) **Capacity values and adjustments.** Biggerstaff, G. 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Water Resources Council's Procedures of December 14, 1979, explicitly recognized the concept that hydroelectric capacity which may not meet the traditional definition of dependable capacity has some value. One purpose of the Water Resources Council's Water and Energy Task Force established to develop methods for implementing the proposed Procedure was the development of an appropriate basis for applying capacity adjustments to reflect the greater reliability of hydropower and also the value of intermittent capacity. A procedures was subsequently developed by Federal Energy Regulatory Commission (FERC) staff based on the load-carrying capability (LCC) concept utilized by many electric utilities in planning generating unit additions. Studies indicated that the appropriate capacity value adjustment to apply to hydropower additions to reflect credits for reliability and intermittent capacity can be determined by developing the ratio of the overall availability (reflecting both its hydrologic availability and its mechanical availability) of the hydropower addition during the peak load season to the mechanical availability of the thermal alternatives during the same period. The annual capacity value of a hydropower addition would thus be the dollars per kilowatt-year cost of the thermal alternative times the overall availability of the hydro addition, divided by the availability of the thermal addition. Depending on the operating characteristics of both the hydro addition and the thermal alternative, up to another 5% could be added to this annual capacity value to reflect any operating flexibility advantages of the hydro project. The development of the method is discussed, and some of the advantages and shortcomings of the procedures are identified.

30229 (TVA/PUB—84/21a, pp 548-552) **Small hydroelectric financial-economic analysis on a micro-computer.** Klotz, L.H. (Univ. of New Hampshire, Durham). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

There are a set of continuing problems with performing a financial-economic analysis of a small hydroelectric facility. The varying data needs for the type of participant in the financing and development process are discussed. That is, the economic data requests and utilization by a developer, investor and debt lending-institution will be generically different from one another even though there will be instances of similarities. A second area of concern for this diverse group is to mutually determine or agree upon debt/equity values that will meet their mutually exclusive financial objectives. Based on past experiences with other developments of facilities, including other small hydro facilities, debt/equity ratios may be selected which are inappropriate for the specific small hydro facility under consideration for development. The results of this approach is often the evaluation that the proposed facility is economically marginal or infeasible. A third problem is the lack of a fast, inclusive, inexpensive and readily available process for the financial-economic analysis. As an approach to resolve these problems, the SHFEAM (Small Hydro-Electric Financial-Economic Analysis on Micro-computers) program has been developed. This program generally follows the logic of the SHYFEA (Small Hydro-Electric Financial/Economic Analysis) program which operates on a main-frame computer, but it has been updated and expanded. The approach is described.

30230 (TVA/PUB—84/21a, pp 393-404) **Regional assessment of small scale hydropower - a methodology for developing countries.** Little, G.E. (Tudor Engineering Co., San Francisco, CA). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A methodology is presented for the regional assessment of small scale hydroelectric potential which makes use of the principle of representative sampling and analyses of typical projects followed by the extrapolation of the results to the regional area for the overall assessment. Statistical theory is utilized to estimate the margin of error involved in the extrapolation procedures. Use of the methodology should result in reasonably accurate estimates in a short period of time of the number, size, and cost of the economically justified small-scale hydroelectric projects which could be developed in the particular region or country under study. It is assumed that the primary use of the methodology will be to obtain an initial estimate of the number and cost of small-scale hydroelectric sites in a region so that the likely scope and economic benefits of a long-term development program can be assessed.

30231 (TVA/PUB—84/21a, pp 444-450) **Power purchase contracts - some suggested approaches.** Brown, P.W. (ELI Corp., Concord, NH). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The power purchase contract is a critical component of many hydroelectric projects being developed by non-utility developers. To reduce the risks of protracted negotiations or worse, negotiation stalemates, it is necessary for the developer to understand fully the financing requirements of the project under consideration. Second, it is necessary for the developer to be fully informed about state regulatory action in enforcing the regulations promulgated under the Public Utility Regulatory Policies Act of 1978 (PURPA) and state regulatory mechanisms available to assist in the negotiating process. Third, it is necessary for the developer to understand the utility with which negotiations are to be undertaken. The form of payment for the production by the hydroelectric facility may vary depending on the flexibility and imagination of the negotiators of the contract. The level of the payments, however they are scheduled, will be constrained by the short run and long run marginal costs confronting the purchasing utility.

30232 (TVA/PUB—84/21a, pp 451-456) **Utility interface.** Kekuna, H.S.L. (Pennsylvania Power and Light Co., Pittsburgh). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

An insight is presented, from one utility's experience, into what the developer needs from a utility to make a project happen, why the utility might be concerned with these needs, and how the utility and developer can work together to mitigate each others' concerns to their mutual advantage. The discussion focuses on interconnection requirements, buy-back rates, and power purchase contract options.

30233 (TVA/PUB—84/21a, pp 239-248) **Costs of small hydro projects.** Christensen, J.P. (International Engineering Co., Inc., San Francisco, CA). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A cost analysis of eight recently constructed small hydroelectric projects is presented. They are all low-head developments in the capacity range of 1325 kW to 24,000 kW constructed at existing dams or canals in the US. Development was carried out by private developers, utilities, irrigation districts, industries, and municipalities with partial funding provided under the Department of Energy's Small Hydropower Technology Development Program. The total costs of generation capacity ranged from $663/kW to $2571/kW in January 1983 dollars and the weighted average was $2046/kW. Direct construction costs accounted for between 56 and 96% of the total project cost. The remaining 43 to 4% of total costs were indirect costs which included engineering, administration, legal and financing expenses. Total actual project costs varied from -5 to +55% of estimated costs. Civil works costs were primarily responsible for this variance.

30234 (TVA/PUB—84/21a, pp 266-273) **Micro-hydro development at the crossroads.** Parrow, D.M. (Oregon Dept. of Energy). 1983. NTIS, PC A24/MF A01. File Number DE84007682. (CONF-830939—Vol.1).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Micro-hydro represents an opportunity for the average landowner to produce electric power. Installation of generating equipment and the sale of power to a local utility can provide a developer with a significant second income. Or, it can represent a string of broken promises and wasted resources. Micro-hydro development is at the crossroads. It has gained popularity with the public. Stories about micro projects frequently are featured in the news media, but lately many of those stories focus on projects which have failed. Most of the development problems with which we are familiar, are the result of grossly inadequate feasibility study, inadequate project design, shoddy installation, and faulty equipment. Continued negative publicity will seriously slow development of this renewable resource. To ensure that development of micro-hydro continues, the industry must work aggressively to reduce the number of projects which fail. Potential developers must fully understand the process for developing a process and the issues which they will have to confront during the development process. We must all work together to ensure that every project constructed is technically and economically sound.

30235 (TVA/PUB—84/21b, pp 558-566) **Pre-feasibility cost estimates for hydropower at existing dams.** Gulliver, J.S.; Dotan, A. (Univ. of Minnesota, Minneapolis). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Guidelines for quick and simple hydropower project cost estimates are developed for pre-feasibility site assessments. The guidelines are based upon a concept which incorporates a single equation utilizing design power and head for total equipment cost and a site factor to determine total project cost. Total project cost is estimated by multiplying the equipment cost, obtained from the equation, and the site factor. Total project cost data from a number of hydropower projects are compiled to provide guidelines for choosing the site factor, which is shown to vary greatly, especially for micro (<100 kW) and mini (>1000 kW) hydropower projects. Envelope curves for site factor are given, and a weighting factor, which is the fraction distance between upper and lower envelope curves, is chosen for each site. The choice of weighting factor for a given site is based upon comparison with recently completed projects, a knowledge of the components which can greatly increase civil works costs, and engineering judgment. The weighting factor is then used in calculations to determine optimum plant capacity. The methodology was used in a survey of the hydropower potential at existing Minnesota Dams, which is presented as a case study.

30236 (TVA/PUB—84/21b, pp 567-575) **Case study of hydropower formulation, Kaw Lake, Oklahoma.** Hight, R.R.; Munsell, F.J. (Army Engineer District, Tulsa, OK). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Production Cost Avoidance (PCA) methodology developed by the Tulsa District, Corps of Engineers, as it was applied in a 1982 hydropower study for Kaw Lake, Oklahoma is described. The impact of the PCA method on hydropower formulation is shown by comparison of the 1982 study to an earlier study for the same site.

30237 (TVA/PUB—84/21b, pp 576-584) **Optimizing hydroelectric systems and equipment.** Neumann, C.A. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Optimization of a hydroelectric system requires detail engineering and cost coordination of the hydraulic, electrical, mechanical and civil aspects. Project objectives need to be established and selection of financing criteria are fundamental requirements. Optimization work would only start after a thorough site investigation to ensure that the project is feasible and the basic design approach and agreed upon objectives are fundamentally sound. This is to say that alternative design approaches such as for a new installation, rehabilitation or uprating of a plant should be evaluated. For installations with low heads of 15-30 ft. and capacities up to 100MW, sites can utilize conventional powerhouse construction or prefabricated power structures, horizontal, vertical or inclined arrangements, single or double regulated turbines, synchronous or induction generators - direct coupled or higher speed generators using speed increasers. With this many potential design choices, it becomes increasingly important to establish the most cost effective design approach. Optimization work based on ineffective use of the hydro resource or high capital cost is not productive. Experience has shown that an inherently higher cost system design will not result in an optimized project.

30238 (TVA/PUB—84/21b, pp 595-604) **Planning power resources in the Pacific Northwest.** Lambie, M.B.M. (Bonneville Power Administration, Portland, OR). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The power planning activities in the four state region serviced by the Bonneville Power Administration, the US Power Marketing Agency in the Pacific Northwest are described. The importance of the hydroelectric resource in the region is shown and the balance sought between fish and wildlife habitat and the use of the water resource for power production is discussed.

30239 (TVA/PUB—84/21b, pp 615-624) **Hydroelectric resource potential at new damsites in the seventeen western states.** Willerl, D.C.; Williams, J. (Tudor Engineering Co., Denver, CO). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Tudor Engineering Company recently completed a study of the hydroelectric potential of undeveloped low-head (less than 66 feet) sites in the seventeen western states. In the first part of the study, which utilized a listing of the hydro sites included in the Corps of Engineers (Corps) National hydro-power study, 2600 potential low-head sites were identified. These potential sites included 500 new undeveloped sites identified by Tudor that were not on the Corps list. After the 2600 sites were screened, 86 sites were selected for appraisal level studies, which was the second part of the study. The methodology, power studies, layout studies, cost estimates and economic analysis that were conducted for the appraisal level studies for the 86 sites are summarized. The results of the appraisal studies were encouraging. Out of the 86 sites, 57 were found to be economically feasible. For the 57 sites, the total installed capacity is 598,000 kilowatts and the installed capacity sizes selected range from about 1200 kilowatts to 30,000 kilowatts. The average annual energy potential of the 57 feasible sites is estimated to be about 3300 gigawatt-hours. The estimated capital cost is about $1.3 billion for the 57 feasible sites, which is about $2165 per kilowatt.

30240 (TVA/PUB—84/21b, pp 710-719) **Case study - New Martinsville Hydroelectric Project.** Linzell, L.E.; Pritchard, D.F. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

With a rated head of 19 1/2 feet and with a discharge of 24,000 cubic feet per second for both turbines at rated discharge, the New Martinsville Hydroelectric Project is one of the lowest head - high flow hydroelectric projects being developed in the US. The project is located at the Corps of Engineers' Hannibal Locks and Dam in New Martinsville, West Virginia. The powerhouse will contain two horizontal axis, 17 megawatt (MW) bulb turbines with runners about 7 meters in diameter. The location, on a major navigable stream, allows the option of prefabrication of the powerhouse structure at any adequately sized shipyard or barge manufacturing facility, with resultant cost savings. The expected average annual energy production is 208 gigawatt-hours.

30241 (TVA/PUB—84/21b, pp 719a-719r) **Development of the North Mississippi Flood Control Water Power Project.** Newton, J.S.; Mathews, C.M.; Earles, J.D. (Civil Engineering, Montgomery, AL). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

On April 15, 1983, the Federal Energy Regulatory Commission (FERC) issued major license 3036-001 to the Municipal Energy Agency of Mississippi (MEAM) for the construction of what will be the first hydroelectric generating facilities in the State of Mississippi. MEAM, which is comprised of eight Mississippi municipalities, is pursuing the development of hydroelectric power at four existing US Army Corps of Engineers (Corps) flood control dams located in North Central Mississippi. These hydroelectric sites are collectively referred to as the North Mississippi Flood Control Water Power Project. All four generating facilities will be run-of-flood control release type. Therefore, flood control requirements, determined by the Corps, will dictate available flow and head. To accommodate these hydroelectric generating facilities on Corps dams, close coordination and cooperation between MEAM and the Corps has been and will continue to be important for timely project execution. Major design and environmental issues which affect Corps structures and lands are being resolved with the Corps. These issues include impacts on recreational opportunities and channel dissolved oxygen at each site. Additionally, Corps review and approval is required for the diversion during construction plan, tunnel lining operations and excavation and dewatering. MEAM's project-to-date coordination effort with the Corps on issues related to the continued development of this project is discussed.

30242 (TVA/PUB—84/21b, pp 720-730) **Hydroelectric development on the Ohio River.** Lawrence, J.D.; Burgoine, D. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Corps of Engineers operates a total of 20 lock and dam structures on the 980 mile long Ohio River. The hydroelectric power potential at these dams has long been recognized and in several cases has already been developed. The high initial investment costs and limitation on dependable capacity at these sites dictate that construction costs be minimized if any economic benefits are to be realized. This has led to several innovative design techniques for these installations to try to cut costs. The prefabricated float-in powerhouse concept is one such approach. Studies undertaken by Acres American Incorporated have shown that although these concepts are potentially sound, it has yet to be conclusively demonstrated that any significant economic benefits can be realized in practice.

Studies on ecosystem modifications in a micro and meso climatic scale for the Tucurui (Brazil) hydroelectric project are presented. The study examined a rational development based on the region's economic potential, without violating the ecological restrictions. Limnology, Macrophytes, Ichtyofanna, phytomas, meteorology and climatology are discussed. The perturbations are not necessarily prejudicial to the ecosystem that is characterized by dynamic processes resulting from natural perturbations. (ESA)

30246 (NP—5750811) **Indian areas threatened by hydroelectric projects in Brazil.** Aspelin, P.L.; Santos, S.C. dos. (International Work Group for Indigenous Affairs (IWGIA), Copenhagen (Denmark)). Oct 1981. 229p. NTIS (US Sales Only), PC A11/MF A01. File Number DE85750811.

In Brazil, as elsewhere, high priority is being given to developing domestic energy sources due to the spectacular increase in the cost of imported petroleum in recent years. This paper discusses the present situation of the thirty-two to thirty-four various Indian areas presently known to be threatened by seven major hydro-electric projects and one flood-control project, either planned or underway, in or directly involving Brazil. A total of at least 100,000 hectares of Indian land (or nearly one hectare for each remaining Brazilian Indian) will be flooded or otherwise expropriated by these projects. Past efforts by the Brazilian National Indian Foundation (FUNAI) to protect the Indians from the pressure of "national development" have not been sufficient. Research, planning, publicity, and political pressure are necessary to ensure that their efforts regarding these hydroelectric projects are more successful.

30247 (TVA/PUB—84/21c, pp 1154-1163) **Environmental impact of hydropower development.** Parker, F.L.; Thackston, E.L. (Vanderbilt Univ., Nashville, TN). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The environmental impacts of hydropower developments have been widely observed. The initial reduction in salmon runs in the Columbia River has been attributed to closure of the river by construction of dams for hydroelectric power. The more recent reduction in fish runs may be due to this closure, plus hatchery practices, oceanic conditions such as coastal upwelling, fishing pressure, and biological cycles. The effect of reduction of flood flows and the sediments and nutrients that they carry has perhaps been most vividly illustrated in the damming of the Nile, with the resultant need for artificial fertilizers and a large reduction in Eastern Mediterranean fisheries. The increased slack water could promote the spread of bilharziasis. The storage of water in surface reservoirs in hot arid regions such as Colorado increases evaporation losses. When the water is used for peaking purposes, profound changes in the biota occur. The stratification of reservoirs can change pre-impoundment cold water stream fisheries to primarily warm water reservoir fisheries. Changes of this nature are seen on the Tennessee River. Proposed developments in the Eastern Soviet Union would reverse flows in a number of streams from the Arctic Ocean to the south. This could potentially affect the climate of the entire Northern Hemisphere. Increased pressure on the earth's crust by reservoir waters could induce seismic events.

30248 (TVA/PUB—84/21c, pp 1164-1173) **Environmental economics of hydropower development.** Stavins, R.; Willey, Z. (Environmental Defense Fund, Berkeley, CA). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

In order to assess adequately the public merits of proposed hydroelectric projects, it is essential to internalize, whenever possible, significant environmental externalities. Such a social benefit-cost (B/C) analysis is conducted of a proposed new hydropower project on the Tuolumne River in California. The project, which had been judged financially feasible in prior (internal) benefit-cost analyses, is found to exhibit a B/C ratio significantly less than 1.0 when environmental impacts are even partially internalized.

30249 (TVA/PUB—84/21c, pp 1182-1190) **Addressing environmental concerns in water resource projects.** Crossman, J.S.; Duda, A.M. (Tennessee Valley Authority, Knoxville). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A recognizance-level survey of environmental concerns associated with hydropower and water resource development was undertaken. Particular attention was given to environmental issues in the Columbia and Tennessee River systems. Landmark legislation, agency responses, and the fundamental underlying causes for not addressing environmental concerns are discussed. Other water resource developments are also examined with attention given to environmental problems and the transfer of their associated costs from the private to public sector. Specific recommendations are proposed for incorporating environmental concerns in project plans and justifications. Several policy options are also presented for meeting this country's water resources challenge.

30250 (TVA/PUB—84/21c, pp 1191-1200) **Modifications to the fishery at Rocky Ford Dam, Kansas.** Hinson, M.O. Jr.; Gebhard, T.G. Jr.; Hartmann, R.F. (Engineering-Science, Austin, TX). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

During 1982, a study was conducted to evaluate the rehabilitation of hydroelectric facilities at Rocky Ford Dam. Rocky Ford Dam is owned by the Kansas Fish and Game Commission and is located in one of the state's most popular recreational fishing areas. The principal objective of the environmental assessment task of the feasibility study was to address the following three environmental issues: (1) maintenance and enhancement of public access and use, (2) effects of hydroelectric operations on fishery resources, and (3) evaluation of potential for adverse impact due to the existence of super-saturated gasses in the releases from an upstream reservoir. The required site modifications under the selected plan were designed to provide new habitat areas and fisherman access areas that would complement hydroelectric generation. Removal of rubble and gravel substrates for the turbine discharge channel will create opportunities to use this fill material to construct groins, dikes, and other fill areas that would create new fishable locations. This case study illustrates how proposed modifications to a small-scale hydroelectric project and the downstream habitat can maintain, and even enhance, a productive fishery habitat and public access to that fishery.

30251 (TVA/PUB—84/21c, pp 1201-1212) **Effects of hydropower development on Columbia River salmonids.** Rondorf, D.W.; Gray, G.A.; Nelson, W.R. (Fish and Wildlife Service, Cook, WA). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Main stem hydroelectric dams in the Columbia basin have deleterious effects on Pacific salmonids that are difficult to reverse with available technology. Hydropower dams have not only flooded spawning areas but have markedly increased the mortality of adult and juvenile salmonids during their migrations. Improved fish ladder design has reduced mortality and delay of adult salmonids during migration, but many problems still persist. Mortality of juvenile migrants has been reduced by traveling screens in turbine intakes, collection of fish and transportation around dams to downstream release sites, and installation of spillway deflectors to reduced gas supersaturation. Part of the mortality of juvenile salmonids during emigration has been attributed to increases in outmigration time and the associated increase in predation and bioenergetic demands, but these sources or mortality have not been quantified. Mitigation practices and recently increased demand for hydropower have resulted in new problems. Increased production of fish in hatcheries to compensate for losses resulting from past hydropower development has created a mixed-stock fishery in which it is difficult to protect naturally produced stocks and yet fully harvest abundant hatchery stocks. Increased demand for low-cost hydropower has led to the installation of additional generating units and changes in regional water management. Regional power planning holds promise as an approach toward mitigating the effects of hydropower development and improving salmonid populations.

30252 (TVA/PUB—84/21c, pp 1213-1218) **Conflict in reservoir management: water quality vs fisheries.** Sasseville, D. (Normandeau Associates, Inc., Bedford, NH). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The apparent sister disciplines, water quality and fisheries biology, may promote conflicting viewpoints when addressing impacts and mitigative measures associated with hydroelectric facility development. The water quality scientist assumes that the cleaner-the-better is the utmost goal of a reservoir management program while the fisheries scientist is often eager to trade some water quality increments to maximize the sport fisheries. Each group has justification for its perspective but identification of critical issues early in the project's life stage coupled with quantification of the impacts and mitigative benefits provides the best resolution.

30253 (TVA/PUB—84/21c, pp 1219-1229) **Preventing fish mortality at hydropower facilities.** Taft, E.P. III; Bazarian, E.; Cook, T.C. (Stone and Webster Engineering Corp., Boston, MA). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The recent increase in small-scale hydropower development in the United States has raised several environmental concerns regarding facility design and operation. Migratory and resident fish mortality resulting from turbine passage is a major issue. To mitigate this mortality, considerable attention has been given to applying available fish protection systems to hydropower facilities. To date, much of the development effort regarding fish protection has concentrated on preventing fish losses at steam electric power stations. Designs and operational information for application of fish protection systems to hydropower facilities is generally lacking for many of the available technologies. Current fish protection technologies fall into one of three broad categories: behavior barriers, fish collection systems, and fish diversion/deterrent devices. Behavior barriers have not generally been proven effective and/or reliable in the protection of fish. Fish collection systems appear to have some application to hydropower facilities but may not be highly effective. Several hydropower facilities have used fish diversion systems with varying success for diverting downstream migrants. Of the available technologies, diversion screens, although relatively costly, may offer the greatest potential for effective fish protection.

30254 (TVA/PUB—84/21c, pp 1230-1238) **Environmental impact of reservoir on the Merse River, Italy.** Olivetti, G. (Dagh Watson, S.p.A., Milan, Italy). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

By the construction of an impounding reservoir on the River Merse, the Farma-Merse Project aims to provide improved irrigation facilities for the Rosia Region and part of the Grossetana Plain. This scheme, together with the Riforma Fondaria (a government-sponsored land development scheme), is expected to enable approximately 37,000 ha of land to be made available for agricultural use. In addition to providing water for irrigation, the reservoir will also provide a means of satisfying the increasing demand for water for domestic and industrial purposes in this region. It will also serve as a means of flood alleviation, particularly for the Grossetana region, which is prone to flooding during periods of heavy rain. Floods such as those which occurred in 1966 should not occur after the reservoir has been constructed. At present, the reservoir is not intended to be used for hydroelectric power generation. The proposal for an impounding reservoir made by the Agricultural and Forest Development Agency for Toscana (ETSAF) recommends the construction of a dam on the River Merse in the Ferrale Plain region of Toscana, southwest of Siena. The impounding reservoir so formed would contain approximately 110 million m^3 of water derived not only from the River Merse but also from the Rivers Farma and La Gonna. The study undertaken principally concentrates on the probable environmental effects that will result upon construction of this reservoir.

30255 (TVA/PUB—84/21c, pp 1239-1243) **Water power developments in Norway, environmental considerations.** Mellquist, P. 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Norwegian water resources are sought after for several purposes, hydroelectric power production being one of them. In 1982, 99.8% of Norway's electrical energy was generated by hydro power. The government has decided that at least until the year 2000 Norway's needs for electricity shall continue to be met by hydro power exploitation. Both nationally and internationally the question of energy production in its broadest sense includes weighing economic advantages against effects on nature and environment. These aspects are not easy to compare and are therefore debated in a number of fora, both political and public-interest oriented. This is not unique for Norway, but is a pattern that most people will recognize. The problems involved in the development of Norway's water resources are discussed.

30256 (TVA/PUB—84/21c, pp 1244-1253) **Environmental programs for large dams in Indonesia - some practical considerations and lessons learned.** Graybill, D.L. (Gilbert/Commonwealth, Reading PA). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

This paper (a) outlines how land compensation, resettlement, and the building of an in-house environmental management unit were planned and are being implemented for two large hydroelectric projects in Indonesia; (b) compares the environmental programs of these and three other dams in Indonesia; and (c) suggests some practical considerations and lessons learned that may be applicable to environmental management for other projects.

30257 (TVA/PUB—84/21c, pp 1254-1273) **Prediction of water quality in proposed hydropower impoundments.** Lee, G.F.; Jones, R.A. (Texas Tech Univ., Lubbock). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The development of a hydropower impoundment normally has a significant impact on the water quality characteristics of the water in the area dammed, as well as the watercourse downstream of it. In addition to removing turbidity, impoundments may convert innocuous forms of iron manganese, and sulfur to chemical forms that can have a significant adverse impact on the water quality of the down stream water receiving the hydropower discharges. The primary factor governing transformations of this type is the trophic state of the waterbody, which is controlled by the aquatic plant nutrient (primarily phosphorus) load to the waterbody and the morphology and hydrology of the waterbody. The US OECD eutrophication study yielded information that can be used to predict the trophic state of a proposed hydropower impoundment. Nutrient export coefficients were developed allowing estimations to be made of the amount of phosphorus that will be received by a waterbody from its watershed. This phosphorus load, combined with the area, mean depth, and hydraulic residence time planned for the waterbody, can be used to predict the planktonic algal chlorophyll concentrations. This information can then be used to predict both in-lake and downstream oxygen, sulfide, iron, and manganese-related water quality problems.

30258 (TVA/PUB—84/21c, pp 1284-1293) **Accuracy and precision in estimating instream flow requirements.** Downing, J.K. (Stone and Webster Engineering Corp., Boston, MA). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The minimum releases of reservoir waters required for the protection or enhancement of environmental resources are known as minimum insteam flows. Typically, the releases are intended to protect sensitive fish and wildlife from no flow or extreme low flow conditions. These minimum instream flows have been required by regulatory agencies at some large generating facilities for many years. More recently, minimum flows have been required as a condition of licensing or relicensing of nearly all hydroelectric facilities. In the past, the determination of magnitude, duration and seasonality of the required minimum flows was based on hydrologic characteristics such as 7Q10 or watershed of the river or reservoir. Increasingly, biological models or the combined application of hydraulic and biological models are used to determine the magnitude of these minimum releases. The methods used to determine minimum flow releases can have direct influence on the economic feasibility of a project by affecting the design of new facilities, and the operational modes of new and existing facilities. Therefore, the precision and accuracy of these methods can be as pertinent to the feasibility of a project as the determination of effective head or flow duration. The precision and accuracy of the output of various methods used for minimum instream flow determinations to measurements of parameters typically determined by hydroelectric engineers in designing facilities or defining operation modes are compared.

30259 (TVA/PUB—84/21c, pp 1294-1304) **Instream flow: increased accuracy using habitat mapping.** Morhardt, J.E.; Hanson, D.F.; Coulston, P.J. (Ecological Analysts, Inc., Lafayette, CA). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The US Fish and Wildlife Service Incremental Flow Instream Methodology commonly utilizes either of two quite different hydraulic models (in conjunction with a habitat suitability model) to evaluate the effects of proposed stream discharged regimes on fish habitats. The newer of these, the IFG4 model, has the potential to overcome many of the limitations of the earlier IFG2 (WSP) model. The use of habitat mapping and selectively dispersed transect placement to improve the accuracy of habitat predictions using the IFG4 model is described.

30260 (TVA/PUB—84/21c, pp 1314-1325) **Water quality management of hydropower discharge.** Speece, R.E. (Drexel Univ., Philadelphia, PA). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

D.O. depletion is commonly noted in the discharge of hydroelectric dams. It is less severe on run-of-the-river dams and more severe on tributary dams having long detention times. Hydroelectric power discharges from tributary dams commonly fail to comply with downstream water quality standards for 100-150 days per year. Turbine venting of the discharges is one of the most favored alternatives being considered to increase the D.O in the discharges. The resulting ratio of dissolved oxygen/nitrogen is significantly different in turbine venting than in spillway discharges. The present US EPA water quality standard of 110% total gas pressure, which evolved primarily from spillway discharge experiences on the Columbia River, is questioned with reference to its appropriateness to turbine discharges. Turbine discharges characteristically contain much lower dissolved oxygen/nitrogen ratios than spillway discharges. Fish response to decreasing dissolved oxygen/nitrogen ratios when total gas pressure is held constant manifests increased severity of symptoms and increased rate of mortality to gas bubble disease. There is a paucity of dissolved nitrogen data in turbine vented discharges and no correlation with the fraction of rated discharge capacity at which the turbine is operating as well as the rate at which air is being drawn in through the vacuum breakers. It is cautioned that these field data should be collected and evaluated before any large-scale program of turbine venting is employed to supplement the D.O. in oxygen depleted hydropower discharges.

30261 (TVA/PUB—84/21c, pp 1326-1335) **Experience with reservoir release aeration and flow improvement.** Davis, J.L.; Bohac, C.E. (Tennessee Valley Authority, Knoxville). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Tennessee Valley Authority's (TVA's) three-year experimental reservoir release improvement program has been directed toward improvement of dissolved oxygen and flow. The program is reviewed giving special emphasis to not only the successful experiments, but also where unanticipated results occurred. In cases where difficulties arose, solutions, to them are discussed. The experiences documented are directed in the hope that they may help others interested in employing reservoir release improvement methods.

30262 (TVA/PUB—84/21c, pp 1336-1345) **Current status of turbine aeration activities at Alabama Power Company.** Miller, D.E.; Sheppard, A.R. (Alabama Power Co., Birmingham). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

During the past decade engineers at Alabama Power Company have directed the research, development, design, installation and testing of the concept of installing deflector plates and air ports in the upper draft tube wall of hydroelectric turbines to aspirate a predetermined quantity of air into the turbine discharge, the objective being to enhance the dissolved oxygen content. A summary of the design of the deflector plate aeration system at the Company's newly constructed R.L. Harris Project which became operational in April, 1983 is presented. A brief description of the bolt-on deflector plate concept being utilized at Mitchell Dam is also discussed. It is believed that the engineering capability now exists to evaluate, design and install efficient deflector plate aeration systems, as an integral part of new construction or as a retrofit in existing units, to meet design goals for oxygen uptake.

30263 (TVA/PUB—84/21c, pp 1346-1353) **Regulation of project releases for water quality management.** Holland, J.P. (Army Engineer Waterways Experiment Station, Vicksburg, MS). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A mathematical simulation methodology is summarized that has been used to develop operational guidance for hydropower projects having reregulation structures and/or pumped-storage capabilities. This methodology combines a one-dimensional reservoir thermal simulation model with a reregulation pool simulation module to predict the thermal characteristics of the reservoir, reregulation pool, and their respective releases for a given set of meteorological, hydrological, and geometrical conditions. From these results, the effects of reservoir and reregulation pool operations, and the effects of changes in these operations, upon project release temperature management may be assessed. An example of the use of this methodology is included.

30264 (TVA/PUB—84/21c, pp 1485-1494) **US dam safety issues.** Bivins, W.S. (Federal Emergency Management Agency, Washington, DC). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The state of dam safety is not good. Data compiled from the States, the National Program of Inspection of Non-Federal Dams - Final Report to Congress and Federal agencies is used to assess the condition of the Nation's dams. Solutions to the dam safety problems can only come from the efforts of owners as supported by State and Federal government. State programs may not be as strong as first thought. A recently completed study of State programs will provide the basis for assessing the state of nonfederal dam safety programs. Federal programs are proceeding, although at a slow pace. Agency funding is constrained and conditions placed on dam rehabilitation slow action. Increased public awareness and imaginative new State and Federal programs bring hope to an otherwise bleak scene. Federal and State efforts are described, including: financial assistance programs, development of technical assistance and self-help efforts by States.

30265 (TVA/PUB—84/21c, pp 1495-1505) **Hazard ratings and warning systems for dams.** Coxon, R.E. 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Factors related to hazard ratings and warning systems for dams are discussed and information received on current practices in these matters in a number of countries is presented.

30266 (TVA/PUB—84/21c, pp 1506-1511) **Probability based safety assessment of existing dams.** Kreuzer, H.; Bury, K. (Crippen Consultants, N. Vancouver, British Columbia). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Dam safety is evaluated by examining several distinct load conditions, taking into account their variability. The uncertainty of the dam's resistance is expressed for several resistance modes, and allowance is made to increase these uncertainties for the presence of non-analytical failure causes. The approach taken is probabilistic, but at a level of analysis that makes it easily accessible to the practicing engineer. The purpose of the analysis is to identify the most critical load condition for a given dam and, ultimately, to compare the relative safety within a set of dams.

30267 (TVA/PUB—84/21c, pp 1517-1525) **Auxiliary spillway improves dam safety at minimal cost.** Passage J.T.; Wong, R.M. (Harza Engineering Company, Chicago, IL). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

Nearly 2925 dams were classified unsafe as a result of the National Dam Safety Inspection Program. Inadequate spillway capacity was common deficiency cited. Many owners have been unable to finance construction of additional spillway capacity to meet the recommended federal or state guidelines for spillway design floods because of the high cost of conventional spillway construction. A comparatively economical alternative for providing additional spillway discharge capacity of earth dams is described. The potential benefits are improved safety, construction costs up to 80% less than conventional spillways, and reduce maintenance and liability.

30268 (TVA/PUB—84/21c, pp 1526-1535) **Spillway addition at TVA's Blue Ridge Project.** Spearman, E.L.; Wagner, C.D. (Tennessee Valley Authority, Knoxville). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

TVA, like other State and Federal Agencies, has initiated a program to review its existing dams for conformance to present-day criteria. Because of the deficiency identified and hazards potential, the Blue Ridge Project has the highest priority of 19 TVA dams which were identified as needing further study.

30269 (TVA/PUB—84/21c, pp 1536-1544) **Rapidan hydroelectric project - retrofit of a 70 year old dam.** Spaulding, D.A. (Indeco Inc., Minneapolis MN). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The retrofit of the 5 MW Rapidan Hydroelectric facility involved technical concerns typical to the renovation of a turn of the century hydro-facility. These concerns included production and revenue modeling, strengthening and rehabilitation of the dam, and the installation of new propeller turbines in a power house originally designed for pressure cased Francis units. As in all renovation projects, the solution to these problems areas was shaped by the specific characteristics of the site. The experience gained at Rapidan in resolving these concerns are discussed.

14 SOLAR ENERGY

30270 (DOE/CS/34039—T1) **Solar Energy Education. Renewable energy activities for junior high/middle school science.** (New York State Dept. of Education, Albany (USA). Solar Energy Project). [1985]. Contract AC01-77CS34039. 102p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85010359.

Some basic topics on the subject of solar energy are outlined in the form of a teaching manual. The manual is geared toward junior high or middle school science students. Topics include solar collectors, solar water heating, solar radiation, insulation, heat storage, and desalination. Instructions for the construction of apparatus to demonstrate the solar energy topics are provided. (BCS)

30271 (DOE/CS/34039—T2) **[Solar energy education project]. Final technical report, January 1, 1980-December 31, 1983.** (New York State Dept. of Education, Albany (USA). Solar Energy Project). 31 Dec 1983. Contract AC01-77CS34039. 18p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85010358.

During the six-and-one-half years of USDOE funding, the main objectives of the project were: (1) to link teachers and scientists in an endeavor to produce materials on renewable energy, (2) to draft, field-test, and revise those materials, and (3) to disseminate those materials to teachers. In these efforts, the project trained over 100 teachers for curriculum writing; produced materials for grades 6 to 12 for science, industrial arts, home economics, social studies, and the humanities; field tested the materials in 40+ states; revised the best field-tested materials; and worked with the four regional solar energy centers to disseminate the materials throughout the country. Moreover, the effort did not stop in 1983. Under industry funding, the project, (now titled the Energy Education Project), continues an intensive program of teacher training and curriculum development in New York State. At the same time, the materials developed under government funding are being distributed to the extent possible, and are widely used in several states by state education departments and energy education projects.

30272 (DOE/CS/34039—T3) **Solar Energy Education. Humanities: activities and teacher's guide. Field test edition.** (New York State Dept. of Education, Albany (USA). Solar Energy Project). Jan 1982. Contract AC01-77CS34039. 173p. Solar Energy Project, c/o Curriculum Services, New York State Education Dept., Albany, NY 12234. File Number TI85010374.

Activities are outlined to introduce students to information on solar energy while performing ordinary classroom work. In this teaching manual solar energy is integrated with the humanities. The activities include such things as stories, newspapers, writing assignments, and art and musical presentations all filled with energy related terms. An energy glossary is provided. (BCS)

30273 (DOE/CS/34039—T4) **Solar Energy Education. Social studies: activities and teacher's guide. Field test edition.** (New York State Dept. of Education, Albany (USA). Solar Energy Project). Jan 1982. Contract AC01-77CS34039. 138p. Solar Energy Project, c/o Curriculum Services, New York State Education Dept., Albany, NY 12234. File Number TI85010373.

Solar energy information is made available to students through classroom instruction by way of the Solar Energy Education teaching manuals. In this manual solar energy, as well as other energy sources like wind power, is introduced by performing school activities in the area of social studies. A glossary of energy related terms is included. (BCS)

30274 (DOE/CS/34039—T13-Pt.2) **Solar Energy Education. Reader, Part II. Sun story.** (New York State Dept. of Education, Albany (USA). Solar Energy Project). May 1981. Contract AC01-77CS34039. 92p. Solar Energy Project, c/o Curriculum Services, New York State Education Dept., Albany, NY 12234. File Number TI85010366.

Magazine articles which focus on the subject of solar energy are presented. The booklet prepared is the second of a four part series of the Solar Energy Reader. Excerpts from the magazines include the history of solar energy, mythology and tales, and selected poetry on the sun. A glossary of energy related terms is included. (BCS)

30275 (DOE/CS/34039—T13-Pt.4) **Solar Energy Education. Reader, Part IV. Sun schooling.** (New York State Dept. of Education, Albany (USA). Solar Energy Project). May 1981. Contract AC01-77CS34039. 80p. Solar Energy Project, c/o Curriculum Services, New York State Education Dept., Albany, NY 12234. File Number TI85010367.

A collection of magazine articles which focus on solar energy is presented. This is the final book of the four part series of the Solar Energy Reader. The articles include brief discussions on energy topics such as the sun, ocean energy, methane gas from cow manure, and solar homes. Instructions for constructing a sundial and a solar stove are also included. A glossary of energy related terms is provided. (BCS)

1401 Resources And Availability

REFER ALSO TO CITATION(S) 30286, 30410, 30412, 30416, 30440, 31299, 31310

30276 (FRNC-TH—1913) **Contribution to the development of solar and meteorological stations in Senegal: microcomputer controlled measuring station and solar tracking system.** Villain, M. (Toulouse-3 Univ., 31 (France)). 1981. 167p. (In French). NTIS (US Sales Only), PC A08/MF A01. File Number DE85751347.

The problems set by the automatic acquisition and processing of measurements for solar and meteorological stations are first recalled. The solar tracking system developed at the I.U.T. at Dakar is then described; the control of the system is assured by microprocessor. The realization of the data acquisition system is presented in detail. Contents of a meteorological data base are presented. Some data on the solar radiation at Dakar are given. Finally a simulation study of the performance of a solar still is presented.

30277 (IC—84/33) **Techniques for the estimation of global irradiation from sunshine duration and global irradiation estimation for Italian locations.** Jain, P.C. (International Centre for Theoretical Physics, Trieste (Italy)). Apr 1984. 31p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701229.

Angstrom equation $H=H_0(a+bS/S_0)$ has been fitted using the least-square method to the global irradiation and the sunshine duration data of 31 Italian locations for the duration 1965-1974. Three more linear equations: i) the equation $H'=H_0(a+bS/S_0)$, obtained by incorporating the effect of the multiple reflections between the earth's surface and the atmosphere, ii) the equation $H=H_0(a+bS/S'_0)$, obtained by incorporating the effect of not burning of the sunshine recorder chart when the elevation of the sun is less than 5 deg., and iii) the equation $H'=H_0(a+bS/S'_0)$, obtained by incorporating both the above effects simultaneously, have also each been fitted to the same data. Good correlation with correlation coefficients around 0.9 or more are obtained for most of the locations with all the four equations. Substantial spatial scatter is obtained in the values of the regression parameters. The use of any of the three latter equations does not result in any advantage over that of the simpler Angstrom equation; it neither results in a decrease in the spatial scatter in the values of the regression parameters nor does it yield better correlation. The computed values of the regression parameters in the Angstrom equation yield estimates of the global irradiation that are on the average within +- 4% of the measured values for most of the locations.

30278 **Determination of direct normal solar radiation from measured global values--comparison of models.** Turner, W.D.; Mujahid, A.M. (Department of Mechanical Engineering, Texas A & M University, College Station, Texas). *Journal of Solar Energy Engineering;* 107: No. 1, 39-44(Feb 1985).

The modeling of direct normal solar radiation from measured global solar radiation is discussed and a new direct normal model developed from the Mississippi County Community College solar monitoring station at Blytheville, Ark., is presented. Comparisons of several existing models, including the Aerospace model developed by Randall and Whitson, are made. The Blytheville model and the Aerospace model are compared using five recent solar radiation data bases. The Aerospace model proved to be superior to all the models for the data bases used; however, the Blytheville model was only slightly less accurate and much easier to use. The Blytheville model predicted the beam radiation accurately for several widely varying climatic locations.

30279 **City form: The creation of comfortable urban microclimates.** Brown, G.Z.; Kleczynski, H.; Novitski, B. (Univ. of Oregon, Eugene, OR). pp 531-535 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper describes a method for analyzing the climate of exterior spaces in terms of human thermal comfort. Hypothetical city configurations are compared in two U.S. climate zones.

30280 **Spectral solar radiation - new data.** Hulstrom, R.L. (Solar Energy Research Inst., Golden, CO). pp 917-919 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Several areas of solar research require an accurate knowledge (data) of the spectral content of solar radiation at the earth's surface for various atmospheric conditions, times during the day (air masses), geographic locations, and for the various seasons (monthly). Areas of solar research include photovoltaics, biomass, materials studies, and solar simulation. As one of its major research thrusts, the Renewable Resource Assessment and Instrumentation Branch (RRAIB) of the Solar Energy Research Institute (SERI, Golden, CO) has been developing improved analytical models, instrumentation, and data sets to meet the various needs for such by the previously mentioned areas of solar energy conversion research. This paper presents a brief summary of selected results of such research. References are given for detailed descriptions of the various individual areas of effort/research and new spectral solar radiation data sets.

30281 **Ashland's energy program from inception to implementation.** Fregonese, J.; Wanderscheid, D. (City of Ashland, Ashland, OR). pp 547-550 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The City of Ashland is a community of 15,000 people, located along Interstate 5 in southwestern Oregon about 20 miles north of the California border. This paper describes the city's solar access and energy program.

30282 **Deschutes County, Oregon: A unique solar access program.** McKeever, M.R.; Connell, C.W. (Conservation Management Services, Inc., Portland, OR). pp 543-546 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

In May and June, 1983, Deschutes County, Bend and Redmond (Oregon) adopted a comprehensive set of solar access amendments to their zoning and subdivision ordinances. The Deschutes County solar access project is unique in several respects, including: the broad-based cooperative project approach used which led to the concurrent adoption of identical ordinance packages by all three major jurisdictions in the County; the comprehensive commitment to solar access protection from all major shading sources, for new and existing structures, and for all classes of property reflected in the ordinances; and the completion of all of the major administrative and technical documents needed to implement the ordinances. Deschutes County sponsored the project; Conservation Management Services, Inc. (CMS) served as project manager; and the Oregon Department of Energy (ODOE) provided technical assistance. The Bonneville Power Administration (BPA), under the terms of the Northwest Electric Power Planning and Conservation Act (Northwest Power Act), funded the project as a model for other local governments in its four-state service territory.

30283 **Evaluating the solar resource: problems resulting from temporal, spatial and angular variations.** Hay, J.E.; Hanson, K.J. (Univ. of British Columbia, Vancouver, BC). pp 899-915 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Accurate assessment of the availability of solar energy at the Earth's surface is hampered by difficulties associated with the variability of solar radiation in space and time and with the angular position in the sky hemisphere. This paper assesses each of these problem areas by highlighting the difficulties and the attempts to offset them. Major emphasis is placed on extrapolation and interpolation procedures, the sensitivity of inclined surfaces to variations in the solar input, numerical models for calculating the irradiance of inclined surfaces and the time scales for which these computations are valid. Finally, the reader is urged to consider the significance of these difficulties in light of both radiation measurement errors and the sensitivity of the application to imprecise determinations of the radiation environment.

30284 **The analysis of minute by minute insolation data and its structural implications.** Stewart, R.; Spencer, D. (SUNY, Buffalo, NY). pp 929-933 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The analysis of minute by minute insolation provides some insight into the magnitude and frequency of impulses created by short-term changes in the insolations. Data of this nature should aid in the development of less costly solar products by eliminating the need for overengineering. Further analysis will provide the relationship between the shortterm changes and specific cloud conditions.

30285 **Marketing and technical research: Solar users in Arkansas.** Buford, P.S.; Douglas, D.E. (Arkansas Power & Light Co., Little Rock, AK). pp 471-474 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The introduction of any new product requires market research sometimes as extensive as the technical research involved in design of the product. This paper describes a study conducted in Arkansas which addresses the two major areas of marketing and technical research.

30286 **An analysis of the benefit-costs of alternative fenestration assemblies for internal-load-dominant buildings noting solar heat gain control and daylighting provisions.** Emery, A.F.; Heerwagen, D.R.; Johnson, B.R.; Kippenhan, C.J. (Univ. of Washington, Seattle, WA). pp 367-372 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A series of alternative fenestration assemblies for a prototypical office building located in Seattle has been analyzed in terms of energy-efficiency and cost-effectiveness. Three computer programs -UWLIGHT, SUNSXN, and HOUSE -- are exercised to estimate annual energy requirements for supplemental electrical lighting, thermal conditioning, and fan operation. Cost estimates for envelope and mechanical systems and for energy consumption are prepared and compared using a Net-Benefits model. The analysis indicates the greatest profitability for assemblies with heat-reflective or tinted glass.

30287 **The increased use of passive solar energy in single-family dwellings, Colorado Springs, CO.** Grogger, P.K. (Univ. of Colorado, Colorado, Springs, CO). pp 349-353 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The cost of hydrocarbon energy increased drastically in the early 1970s. Because of a declining resource base, international politics, and an increasing inflation rate, the population of the United States became aware of an energy crisis. The City of Colorado Springs and surrounding communities were more fortunate than many other areas throughout the United States. The cost of energy increased but because of a city-owned public utilities and advantageous contracts the cost of energy to residents remained in the lower 10% of energy costs through the United States. Even so, contractors, developers, local politicians and the average resident wanted to keep energy costs as low as possible. With both gas and electrical pricing increasing due to pass through rate adjustments and changing federal regulations the use of alternative energy sources started to become more common. In Colorado Springs three energy sources became more frequently utilized: (1) electrical generation by wind; (2) active solar with hot water heating the dominant use; and (3) passive solar use for space heating.

30288 **A better understanding of the potential passive solar market.** Bailey, G.; Heibein, S.; Johnson, B.; McLaurin, M.; Nicklas, M.; Parlow, G. (Innovative Design Inc., Raleigh, NC). pp 355-360 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The following information is presented in an attempt to clarify exactly how passive solar construction can best fit into today's housing market and identify the specific factors that make passive solar a marketable commodity. Informed builders can capitalize on an understanding of the variety of components -- including the general trend toward energy efficiency -- which affect a buyer's decision to purchase a home with solar features.

30289 **Passive solar houses and electric utilities, an impacts analysis.** McCabe, T.F.; Purcell, G.G. (JBF Scientific Corp., Wilmington, MA). pp 373-378 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

In EPRI research project RP1666-1 procedures and methods were developed for determining the thermal performance of passive solar and energy conserving single family detached residential units and their potential utility impacts. These methods were applied to determine the impact of selected penetrations of alternative residential building designs on the loads of four utilities each located in a different climatic zone. Results include a comparison among conventional, energy conserving, and passive solar housing types. The building variation of choice which minimizes the total of homeowner equipment costs and utility energy and demand costs is discussed for each location. Intermediate results on route to the final annualized costs are discussed and compared among the four utilities. It was concluded that passive solar houses can significantly reduce homeowner and utility costs over conventional house designs and can moderately reduce these costs over energy conserving designs in some climates.

30290 Marketing attached greenhouses in an affordable subdivision: Fairway Village, Santa Fe, NM. McAdams, W.; Chapman, M. (Passive Solar Systems, Santa Fe, NM). pp 335-338 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Fairway Village is a 154-unit middle-income subdivision under construction by Chapman Builders in Santa Fe, New Mexico. Chapman is a traditional, production homebuilder delivering over 100 units a year. Particpants in HUD's and NAHB's Joint Venture for Affordable Housing Demonstration, Fairway Village homes are priced from $49,950 to $69,500 and targeted toward first-time buyers with incomes of $20,000 to $30,000. Designed primarily with affordability in mind, the project offers greenhouse kits which the builder will install as an option. The greenhouse option makes Fairway Village unique among HUD Affordable Housing participants. This paper discusses the process by which a traditional builder attempts to enter the market with an optional solar system, given the tight cost constraints of an affordable subdivision.

30291 Should the sun set on state solar tax credits: an Arizona perspective. Kim, J.; Berkowitz, P.; Johnson, L. (Arizona State Univ., Tempe, AZ). pp 560-566 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

In recent years, tax credit programs have been widely evaluated due to fiscal problems encountered by state and local governments. In Arizona the state solar tax credits could be headed for extinction. Since 1978 Arizonans have received over $40 million in solar tax credits. The number of solar units in that same period exceeds 55,000, the vast majority being residential, domestic hot water applications. This paper presents a brief overview of some of the critical and legitimate issues involved in a solar tax credit analysis. Furthermore, some recommendations from the preliminary results of the cost-benefit analysis of Arizona solar tax credits are described.

1404 Environmental, Legal, And Institutional Aspects

30292 (DOE/CS/30134—T1) [Solar industry standards]. Final technical report. Master, L.W. (ASTM, Philadelphia, PA (USA)). 20 Jun 1984. Contract FG01-78CS30134. 13p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85013134.

In order to accelerate the development of urgently needed standards for solar energy systems, components and materials, funding was designated for activities such as procurement of first draft documents, reimbursement of travel expenses for interim subcommittee and task group meetings, reimbursement of travel expenses for designated consumer representatives, honorariums for consumer-advocate experts and round robin testing. The purpose of this report is to summarize the progress made in the development of standards since 1979, to identify the extent to which funding by the Grant aided in the standards development process and to summarize the expenditures made.

30293 (DOE/CS/34039—T13-Pt.1) Solar Energy Education. Reader, Part I. Energy, Society, and the Sun. (New York State Dept. of Education, Albany (USA). Solar Energy Project). May 1981. Contract AC01-77CS34039. 70p. Solar Energy Project, c/o Curriculum Services, New York State Education Dept., Albany, NY 12234. File Number TI85010368.

A collection of magazine articles which were selected for information on solar energy is presented in this booklet. This booklet is the first of a four part series of the Solar Energy Reader. The articles provide brief discussions on topics such as the power of the sun, solar energy developments for homes, solar energy versus power plants, solar access laws, and the role of utilities with respect to the sun's energy. (BCS)

30294 (PB—85-160067/XAB) CEC (Commission of the European Communities) solar energy modelling: Progress report of the Irish participants of the CEC Modelling Group, 1979/81. Kelledy, E. (Commission of the European Communities, Luxembourg). [1985]. 129p. (EUR—9147-EN). NTIS, PC E07/MF E07.

Prepared in cooperation with Trinity Coll., Dublin (Ireland).

The report describes the activities of the Irish participant in the CEC Solar Energy Modelling Group effort in the period 1980-1981. The background to and objectives of the overall program are described. The development and programming of a solar-system simulation model are discussed in some detail. The sensitivity of this model to changes in major system parameters is examined, and model-predicted system performance measures are compared to real data from Danish, Irish, and Belgian test installations.

REFER ALSO TO CITATION(S) 29642, 29665, 29726, 30059, 30062, 30063, 30064, 30069, 30070, 30071, 30072, 30073, 30074, 30077, 30078, 30079, 30080, 30082, 30083, 30086, 30087, 30336, 30344, 30544, 30548, 30556, 31374, 31635, 31686, 31687, 31749, 32216, 32281

30295 (BNL—36577) Improved blue response and efficiency of A-Si:H solar cells deposited from disilane using a dual-chamber plasma system. Rajeswaran, G.; Vanier, P.E.; Corderman, R.R.; Kampas, F.J. (Brookhaven National Lab., Upton, NY (USA)). 1985. Contract AC02-76CH00016. 10p. (CONF-851043—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013289.

From 18. IEEE photovoltaic specialists conference; Las Vegas, NV, USA (21 Oct 1985).

Thin film amorphous silicon solar cells with glass/SnO$_2$/p/i/n/Al structures and 6 to 7% AM1 conversion efficiencies were fabricated at rapid deposition rates in a newly constructed dual-chamber glow discharge deposition system. The 500 nm thick intrinsic layer was deposited at the rate of 1.7 nm/s using disilane (Si$_2$H$_6$)-helium mixtures. This deposition rate is an order of magnitude greater than conventional high efficiency amorphous silicon solar cell depositions. Residual boron doping effects at the p/i interface can severely degrade cell performance particularly when the intrinsic layer is deposited in one chamber of the dual-chamber system and the intrinsic layer is deposited in the other chamber that is free of boron contaminants. Parameters such as electrode spacing, Si$_2$H$_6$ partial pressure and flow rate were optimized to produce uniform deposition over large areas. At the substrate temperature T/sub s/ selected for solar cell intrinsic layer deposition, the spin density was measured to be a minimum at 5 x 10^{15}/cm^3. For a given T/sub s/, an intrinsic layer deposited from Si$_2$H$_6$ absorbs fewer photons and can generate less current under solar simulation than a similar film produced from monosilane. Identical solar cells were deposited in either the single-chamber mode or the dual-chamber mode for comparison. Single-chamber mode cells perform poorly over the visible wavelengths and hence produce low short circuit currents. The dual-chamber mode cells show a significant improvement in blue response and a factor of two increase in short circuit current over the single-chamber mode cells. Under short circuit conditions, 15 mA/cm^2 was generated from rapidly deposited (1.7 nm/s) cells from disilane and 18 mA/cm^2 from low deposition rate (0.18 nm/s) monosilane cells. These values are comparable to or better than those reported for similar cells by other groups.

30296 (CONF-850307—1) Short-radiation woody crops production research in the South. Ranney, J.W.; Trimble, J.L.; Wright, L.L.; Perlack, R.D. (Oak Ridge National Lab., TN (USA)). Mar 1985. Contract AC05-84OR21400. 17p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011411.

From 3. Southern biomass energy research conference; Gainesville, FL, USA (12 Mar 1985).

National priorities for research on short-rotation woody crops as energy feedstock are set to achieve economic competitiveness with alternative energy and forest product feedstocks. Present estimates of production costs vary from \$3.50 to \$8.00/GJ of usable heat (i.e., after conversion by direct combustion). Therefore, based on research results, short-rotation-derived feedstocks may soon be competitive in some locations with most other fuels, except wood wastes and coal. However, further cost reductions under operating conditions are still necessary for wide concept utilization. These reductions can best be accomplished through genetic improvements of species development of more efficient harvesting methods and equipment, and utilization of optimum cultural techniques. These topics are discussed with some specific references to the South to more specifically portray the state-of-the-art of short-rotation woody crops for energy. Ultimate costs of production could be \$2.75 to \$5.00/GJ of usable heat or about \$15/green Mg (\$30/dry Mg), while productivity rates could reach 9 to 15 dry M ha^{-1} $year^{-1}$ on many sites. 17 refs., 3 figs., 3 tabs.

30297 **(DOE/CE—0106) Photovoltaics technology program summary.** (Conservation and Renewable Energy Inquiry and Referral Service, Silver Spring, MD (USA)). May 1985. Contract AC01-83CE30780. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013098.

FS 194, 1st Edition.

30298 **(DOE/CS/34039—T7) Solar Energy Education. Renewable energy activities for biology.** (New York State Dept. of Education, Albany (USA). Solar Energy Project). 1982. Contract AC01-77CS34039. 63p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85010370.

An instructional aid for teachers is presented that will allow biology students the opportunity to learn about renewable energy sources. Some of the school activities include using leaves as collectors of solar energy, solar energy stored in wood, and a fuel value test for green and dry woods. A study of organic wastes as a source of fuel is included. (BCS)

30299 **(DOE/ER/04927—T5) Mechanisms of photochemical energy conversion by chlorophyll. Technical progress report, March 1, 1983-March 1, 1985.** Tollin, G. (Arizona Univ., Tucson (USA). Dept. of Biochemistry). 1985. Contract AC02-78ER04927. 8p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012535.

Highlights of progress achieved during the period from March 1, 1983-March 1, 1985 are briefly summarized. The results from 4 projects are reported. Electrostatic effects on electron transfer using both charged and uncharged bilayer vesicles and using cholesterol were investigated. The effects of acceptor solubility on photosensitized electron transfer reactions were probed using viologen derivatives. Correlation was made between the efficiency of charge separation and the rate of escape of viologen radical from the membrane to the aqueous phase. The study demonstrates that the kinetics of photosensitized electron transfer reactions in vesicle systems can be controlled by adjusting the solubility properties of the quencher. The kinetics are also sensitive to electrostatic effects at the interface. (DMC)

30300 **(DOE/JPL/954527—27/84) Investigation of test methods, material properties, and processes for solar cell encapsulants. Eighth annual report.** Willis, P.B. (Springborn Labs., Inc., Enfield, CT (USA)). 1985. Contract NAS-7-100-954527. 101p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85012831.

The historical development of ethylene-vinyl acetate (EVA) is presented, including the functional requirements, polymer selection, curing, stabilization, production and module processing. The construction and use of a new method for the accelerated aging of polymers is detailed. The method more closely resembles the conditions that may be encountered in actual module field exposure and additionally may permit service life to be predicted accurately. The use of hardboard as a low cost candidate substrate material is studied. The performance of surface anti-soiling treatments useful for imparting a self-cleaning property to modules is updated. (LEW)

30301 **(DOE/JPL/956312—11) Stress and efficiency studies in EFG. Quarterly progress report, January 1, 1985-March 31, 1985.** (Mobil Solar Energy Corp., Waltham, MA (USA)). 15 May 1985. Contract NAS-7-100-956312. 42p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013589.

Detailed EBIC characterization of stressed FZ and CZ silicon of varying oxygen and carbon levels has been carried out. The bulk diffusion lengths are limited by point defect recombination to about 15 to 25 microns in dislocation-free regions after the high temperature (>1200°C) heat treatment and stress application. Increases in dislocation density from $1 \times 10^4/cm^2$ to over $1 \times 10^7/cm^2$ further decrease the diffusion length to the range 10 to 15 microns. One-hour anneals at 575°C and 850°C produce little increase in diffusion length, at most by a factor of two, while preferential gettering at dislocations is weak. Significant differences in silicon with varying oxygen and carbon levels are not observed. Four-point bending has been carried out at 1000°C and lower to provide more samples to continue the studies on electrical activity of dislocations. Several modified afterheater shield configurations were tested in Furnace 17 and ribbon was grown to attempt to minimize dislocation densities. Stress distribution profiles are also being calculated for some growth configurations. The stress modeling at Harvard University has been directed toward implementing a new scheme for calculating residual stress, which has important implications for understanding creep and strain relationships to residual stress.

30302 **(DOE/SF/12200—T1) Radiant solid phase decomposition studies. Technical status report.** T-Raissi, A. (Hawaii Univ., Honolulu (USA). Hawaii Natural Energy Inst.). Jun 1985. Contract AC03-84SF12200. 28p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85013587.

In this report, recent results of research concerned with fundamental studies of the high temperature solid phase decomposition of zinc sulfate at low and high heating rates are presented. The low heating rate studies were carried out using a conventional thermogravimetric system (Setaram Simultaneous TGA/DTA unit). The high heating rate results were obtained in a novel, Fast-TGA system capable of rapidly weighing materials exposed to concentrated radiant energy derived from an arc image furnace. The goal of this work is to identify unique effects of radiant heating on the decomposition behavior of zinc sulfate. This report presents a set of low heating rate results and compares them to those of other investigators. While the fundamental low heating rate studies of solid phase decomposition using conventional thermal analysis systems is now routine, very few instruments are currently available to study these processes under high temperature (>2000°C), high radiative flux (up to 1000 W/cm^2) environments similar to that of a solar furnace. Typical decomposition results obtained from intense radiative heating of zinc sulfate are presented and discussed in conjunction with the design of a novel thermogravimetric system.

30303 **(FRNC-TH—1880) Characterization of defects in InSe. Application to the photovoltaic conversion.** Houdy, P. (Paris-7 Univ., 75 (France)). 1982. 134p. (In French). NTIS (US Sales Only), PC A07/MF A01. File Number DE85751584.

One studies the method for growing InSe crystals and the problems of doping and annealing. The characteristics of different types of InSe solar cells are examined. The diffusion mechanisms which come into effect at different temperatures are described, and a proposition of a two dimensional defect model is presented. Electron microscopy allows to observe surface defects and two dimensional macroscopic defects. The effect of impurities on the excitonic peak of InSe is finally considered.

30304 **(FRNC-TH—1884) Contribution to the development of a pilot manufacturing line of Cu_2S-CdS film solar cells using the chemical reactive spray method.** Maris, O. (Montpellier-2 Univ., 34 (France)). 1980. 113p. (In French). NTIS (US Sales Only), PC A06/MF A01. File Number DE85751585.

Each step in the fabrication of these cells is studied, as also the evolution of each step up to the present time. This evolution is examined in terms of the results obtained for each particular configuration of the manufacturing line. Problems concerning series contact resistance and problems posed by electrodes are studied. The move towards greater surface areas is considered along with cell stability.

30305 (LBL—19374) Fuel oils from higher plants. Calvin, M. (Lawrence Berkeley Lab., CA (USA)). Mar 1985. Contract AC03-76SF00098. 31p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013187.

A summary of the types of plants available for converting solar energy to fuel and materials on an annually renewable basis is presented. Sugar cane, seed oils, herbaceous plants (Hevea, Euphorbia, Asclepias), hydrocarbon producing trees (Eucalystus globulus, Pittosporum, Copaifera), and algae are discussed. Emphasis is placed on the development of "energy agriculture" and the use of plants to synthesize hydrocarbon-like materials especially in the less developed areas of the world. (DMC)

30306 (N—85-16294) Results of the 1984 NASA/JPL balloon flight solar cell calibration program. Downing, R.G.; Weiss, R.S. (Jet Propulsion Lab., Pasadena, CA (USA)). Oct 1984. 17p. (NASA-CR—174270; JPL-PUBL—84-65). NTIS, PC A02/MF A01.

The 1984 solar cell calibration balloon flight was successfully completed on July 19, meeting all objectives of the program. Thirty-six modules were carried to an altitude of 36.0 kilometers. The calibrated cells can now be used as reference standards in simulator testing of cells and arrays.

30307 (N—85-16295) Multijunction cells for concentrators: technology prospects. Ferber, R.R.; Costogue, E.N.; Shimada, K. (Jet Propulsion Lab., Pasadena, CA (USA)). Nov 1984. 50p. (NASA-CR—174259; JPL-PUBL—84-71). NTIS, PC A03/MF A01.

Development of high-efficiency multijunction solar cells for concentrator applications is a key step in achieving the goals of the U.S. Department of Energy National Photovoltaics Program. This report summarizes findings of an issue study conducted by the Jet Propulsion Laboratory Photovoltaic Analysis and Integration Center, with the assistance of the Solar Energy Research Institute and Sandia National laboratoies, which surveyed multijunction cell research for concentrators undertaken by federal agencies and by private industry. The team evaluated the potentials of research activities sponsored by DOE and by corporate funding to achieve projected high-efficiency goals and developed summary statements regarding industry expectations. Recommendations are made for the direction of future work to address specific unresolved aspects of multijunction cell technology.

30308 (N—85-16302) Demonstration of transparent solar array module design. Final report. Pack, G.J. (Lockheed Missiles and Space Co., Inc., Sunnyvale, CA (USA); Jet Propulsion Lab., Pasadena, CA (USA)). Sep 1984. 79p. (NASA-CR—174257). NTIS, PC A05/MF A01.

This report discusses the design, development, fabrication and testing of IR transparent solar array modules. Three modules, consisting of a baseline design using back surface reflector cells, and two modules using gridded back contact, IR transparent cells, were subjected to vacuum thermal balance testing to verify analytical predictions of lower operating emperature and increased efficiency. As a result of this test program, LMSC has verified that a significant degree of IR transparency can be designed into a flexible solar array. Test data correlates with both steady state and transient thermal analysis.

30309 (N—85-17364) Automated assembly of Gallium Arsenide and 50-micron thick silicon solar cell modules. Mesch, H.G. (TRW Space Technology Labs., Redondo Beach, CA (USA)). Dec 1984. 23p. (NASA-CR—174331). NTIS, PC A02/MF A01.

The TRW automated solar array assembly equipment was used for the module assembly of 300 GaAs solar cells and 300 50 micron thick silicon solar cells (2 x 4 cm in size). These cells were interconnected with silver plated Invar tabs by means of welding. The GaAs cells were bonded to Kapton graphite aluminum honeycomb graphite substrates and the thin silicon cells were bonded to 0.002 inch thick single layer Kapton substrates. The GaAs solar cell module assembly resulted in a yield of 86% and the thin cell assembly produced a yield of 46% due to intermittent sticking of weld electrodes during the front cell contact welding operation. (Previously assembled thin cell solar modules produced an overall assembly yield of greater than 80%).

30310 (SAND—85-0791/1) Photovoltaic Concentrator Technology Project. Thirteenth project integration meeting. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 282p. (CONF-8506140—Absts.). NTIS, PC A13/MF A01; 1; GPO Dep. File Number DE85013253.

From 13. photovoltaic concentrator project integration meeting; Albuquerque, NM, USA (4 Jun 1985).

This report is the Proceedings for a meeting on Photovoltaic Concentrator Technology held in Albuquerque, NM on June 4 and 5, 1985. The meeting covered research on photovoltaic concentrators and their components, including concentrator cells, cell assemblies, fresnel lenses, concentrator modules, tracking structures and control systems, and complete concentrator arrays. This report contains abstracts of presentations made at the meeting and status reports for current research contracts. This report is a companion to SAND-85-0791/2 which contains summaries of the more important findings presented at the Project Integration Meeting.

30311 (SERI/CP—211-2682) 1985 amorphous silicon review meeting. (Solar Energy Research Inst., Golden, CO (USA)). Mar 1985. Contract AC02-83CH10093. 322p. (CONF-8503106—). NTIS, PC A14/MF A01; 1; GPO Dep. File Number DE85008794.

From Amorphous silicon subcontractors annual review meeting; Washington, DC, USA (21 Mar 1985).

Separate abstracts were prepared for 32 papers in this meeting proceedings. One other paper had been previously abstracted for EDB. (LEW)

30312 (SERI/PR—212-2634) Solid/melt interface studies of high-speed silicon sheet growth. Final technical progress report, July 15, 1983-July 15, 1984. Ciszek, T.F. (Solar Energy Research Inst., Golden, CO (USA)). Feb 1985. Contract AC02-83CH10093. 67p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85008783.

Radial growth-rate anisotropies and limiting growth forms of point-nucleated, dislocation-free silicon sheets spreading horizontally on the free surface of a silicon melt have been measured for (100), (110), (111), and (112) sheet planes. Analysis of the sheet edges has led to predicted geometries for the tip shape of unidirectional, dislocation-free, horizontally growing sheets propagating in various directions within the above-mentioned planes. Feasibility was demonstrated for a crucible-free horizontal (CFH) ribbon growth method. High-purity, cold-crucible melt confinement was used to grow silicon sheets by edge-supported pulling (ESP). Quartz capillary filaments were used. Solar cell data on these sheets are presented. Also cell, lifetime, mobility, spreading resistance, x-ray topography, and neutron activation analysis data were obtained for dislocation-free cylindrical ingots of [111] and [100] orientation. We conducted x-ray topography analysis of dendritic web silicon sheets, and the resultant topographs are presented in this report. A possible correlation between slip dislocations and web cell efficiency was seen. Float zoning studies were initiated for high-purity, dislocation-free silicon to be applied to high-efficiency silicon solar cells.

30313 (SERI/STR—211-2607) Photovoltaic devices using hydrogenated amorphous silicon produced by the chemical vapor deposition of higher order silanes. Final report, 1 August 1982-31 August 1983. Delahoy, A. (Chronar Corp., Princeton, NJ (USA)). Apr 1985. Contract AC02-83CH10093. 39p. NTIS, PC A03. File Number DE85008810.

This report presents the results of work performed to explore the properties of hydrogenated amorphous silicon (a-Si:H) produced by the chemical vapor deposition (CVD) of higher order silanes. The higher silanes were produced by a chemical method and by silent electric discharge of CCD-grade monosilane. The latter method yields a high-purity mixture of higher silanes. The a-Si:H films were deposited mainly from silane by a static CVD method: the heated reactor was purged and evacuated and then filled to the initial pressure desired with reactant gases. The extent of the deposition chemistry was monitored by the increase in pressure. At a predetermined increase in pressure, the system was quickly evacuated. This process was repeated several times to obtain a film of the desired thickness. These experiments were performed to increase our understanding of the deposition mechanism of a-Si:H, to improve the quality of CVD a-Si:H layers for device applications, to measure the properties of CVD a-Si:H doped and undoped layers, and to explore new device structures and alternative CVD techniques.

30314 **(SERI/STR—211-2675) Research on high-efficiency, single-junction, monolithic, thin-film amorphous silicon solar cells. Annual report, 1 December 1983-30 November 1984.** Ashton, G.R.; Aspen, F.E.; Epstein, K.A.; Jacobson, R.L.; Jeffrey, F.R.; Patel, R.I.; Shirck, J.R. (Minnesota Mining and Mfg. Co., St. Paul (USA). Electronic and Information Sector Labs.). Apr 1985. Contract AC02-83CH10093. 93p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85008809.

The design and construction features of a monolithic, series-connected, amorphous silicon solar cell are presented in this report. Each large-area individual cell was to measure 0.5 cm x 10.0 cm. The technology and systems capabilities of continuous, large-area deposition onto flexible substrates are important to the successful commercialization of thin-film a-Si solar cells, to minimize two of the major factors that influence the overall manufacturing cost of amorphous silicon photovoltaic devices: capital costs and substrate handling costs. Capital costs should be minimized by systems that operate continuously, and substrate handling costs should be minimized by maximizing substrate size. Two basic design concepts for deposition chambers are discussed. One uses an in-line deposition configuration and the other employs a rotating drum that transports the web.

30315 **(SERI/TR—215-2484) Resource evaluation and site selection for microalgae production systems.** Maxwell, E.L.; Folger, A.G.; Hogg, S.E. (Solar Energy Research Inst., Golden, CO (USA)). May 1985. Contract AC02-83CH10093. 98p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85008807.

Climate, land, and water resource requirements of microalgae production systems (MPS) were examined relative to construction costs, operating costs, and biomass productivity. The objective was the stratification of the southwestern United States into zones of relative suitability for MPS. Maps of climate (insolation, freeze-free period, precipitation, evaporation, thunderstorm days), land (use/cover, ownership, slope), and water (saline groundwater) resource parameters were obtained. These maps were transformed into digital overlays permitting the cell-by-cell compositing of selected resource parameters to form maps representing relative productivity, make-up water, climate suitability, land suitability, water suitability, and overall suitability. The Southwest was selected for this study because of its high levels of insolation, saline water resources, and large areas of relatively low valued land. The stratification maps cannot be used for the selection of specific sites because of their low resolution (12,455-acre cells). They can be used to guide future resource studies and site selection efforts, however, by limiting these efforts to the most suitable regions. Future efforts should concentrate on saline water resources, for which only limited data are currently available. 13 refs., 44 figs., 5 tabs.

30316 **(SLU-LBT—129) Straw burning plants. Operation experiences from six farms 1981/82 and 1982/83.** Ivarsson, E. (Swedish Univ. of Agricultural Sciences, Lund. Dept. of Farm Buildings). Sep 1983. 115p. (In Swedish). (STU—80-5503). NTIS (US Sales Only), PC A06/MF A01. File Number DE85750870.

One of the main purposes of the project was to study a number of straw burning plants practically. Observations and registrations were made to determine the following factors: 1) Time required to handle the straw, to control and run the plant. 2) Furnace efficiency and operation. 3) Amount of ash. The determination of furnace efficiency was based on the effective calorific value of the straw, the amount of straw fed and the output energy of the furnace. By this the accurate determination of the moisture content of the straw fed is of great importance for the final results.

30317 **(STEV-EO—83-13) Energy Forest. Experiment on a large scale Domaen. Progress report 2.** Eden, P. (Statens Energiverk, Stockholm (Sweden)). 1983. 100p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. File Number DE85750814.

The experiment is being executed on a large bog of 85 hectare called Finnmossen, 30 km north Vaesterass. The aim of the project is to carry out a practical experimental cultivation of energy forest, to enable all aspects of the chain, from choice of land and the establishing of the cultivation through to harvesting and the final utilization, to be included. The project was started April 1979 and its 4 stages are planned to Dec 1987. The resources included 16584000 SEK. This report forms an account of the project establishment stage which is No. 2. Nearly 2 million cuttings and plants of the Salix family have been planted. A special basic vehicle, having a very low ground pressure, and a special deep harrowing machine which can deposit lime to a depth of 0.45 m in the cultivated rows are being developed. A new idea to regulate water in the ditches has been tested. Different clones show large variations concerning growth and degree of hardiness. The general estimate for the total establishment lies in the region of 14500 to 20000 SEK per hectare. Stage 2 shows that economically justifiable methods and systems for the establishment of energy forest can be found.

30318 **(STEV-EO—84-4) Technical systems in energy forestry.** Noren, O.; Danfors, B.; Stambeck, A. (Statens Energiverk, Stockholm (Sweden)). 1984. 145p. (In Swedish). (JTI—53). NTIS (US Sales Only), PC A07/MF A01. File Number DE85750839.

Cost examples and performance data referring to different kinds of machinery inputs are given, e.g., for soil treatment and weed control. A short description is then given of requirements on soil types, shapes of fields, etc. The off-road mobility of machinery and vehicles in this connection is of exceptionally great importance both during the summer and winter as planting and management take place during the summer and the harvest during the winter. Snow conditions in Sweden (depth, density and mass) have been studied in detail and a special appendix describes snow conditions at several places. The different work operations and equipment required in connection with planting, management and harvest of energy forests are discussed in chronological order. As examples can be mentioned clearing of vegetation, draining, stone clearing and soil tillage. Examples of operations where special inputs will be required to develop techniques and equipment are planting of cuttings and weed control in new and growing stands. Off-road mobility and risk of damage to the soil surface will require development of, in some cases, advanced wheel or track equipment. The harvesting of energy forests has been surveyed. The handling, drying and storage of the harvest have been discussed. Harvesting, storage and distribution of cuttings will require developmental work. The planting, management and harvest of energy forests requires certain amount of service and requirements in the form of, e.g., fuel, spare parts and equipment for hauling or winching out bogged-down machinery. In general it is observed that available technique and equipment can easily be adapted for certain work operations in energy forestry. In other cases there will be a need for development of basic data and development of new techniques if energy forestry is to be able to be conducted to any greater extent and to be competitive.

30319 **(STEV-SB—84-1) Progress report fiscal year 1982/83, Forest Energy Project.** Nilsson, P.O. (Statens Energiverk, Stockholm (Sweden)). Sep 1983. 53p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750845.

With the Forest Energy Project publication list 61 ref.

The Forestry Energy Project at the Swedish University of Agriculture Sciences started in 1977 with the objective to develop necessary knowledge for an increased use of wood fuel in Sweden in order to substitute imported oil. The aim is to describe and analyse systems and machine components to be used in harvesting, transportation, storage and conversion of various forestry resources, such as logging residues - tops, branches and stumps from clear cuts - and small trees from thinnings. The systems shall be applicable to demands posed by different categories of forest owners and be designed with consideration to good economy, high availability, and the demand for good working conditions as well as the conservation of nature. The project is financed by the National Swedish Board for Energy Source Development, the total support for the six years July 1977-June 1983 being 23.5 million Swedish Crowns.

30320 Chemical vapor deposition of boron-doped hydrogenated amorphous silicon. Ellis F.B. Jr.; Delahoy, A.E. (Chronar Corporation, Princeton, New Jersey 08542). *Applied Physics Letters;* **47**: No. 2, 135-137(15 Jul 1985).

Deposition conditions and film properties for a variety of boron-doped hydrogenated amorphous silicon films and silicon-carbon films produced by chemical vapor deposition (CVD) are discussed. Deposition gases include monosilane, disilane, trisilane, and acetylene. Two types of optically wide band-gap p layers are obtained. One of these window p layers (without carbon) has been extensively tested in photovoltaic devices. Remarkably, this p layer can be deposited between about 200 to 300 °C. A typical open circuit voltage in an all CVD p-i-n device is 0.70—0.72 V, and in a hybrid device where the i and n layers are deposited by glow discharge, 0.8—0.83 V.

30321 Process-induced defects in solar cell silicon. Gleichmann, R.; Cunningham, B.; Ast, D.G. (Department of Materials Science and Engineering, Bard Hall, Cornell University, Ithaca, New York 14853). *Journal of Applied Physics;* **58**: No. 1, 223-229(1 Jul 1985). Contract AC02-76ER02899.

The microstructure of as-grown and processed, edge-defined film-fed grown, silicon ribbons was studied in order to identify the basic mechanisms responsible for the change of the as-grown defect structure during processing at elevated temperatures. The short heat treatment required to diffuse the p-n junction was sufficient to cause heterogeneous precipitation of impurity atoms, particularly transition metals. In addition, an elastic recovery of the ribbon occurred by dislocation glide, resulting in the formation of a polygonizationlike structure of sub boundaries in the base. Mechanism are suggested by which twin boundaries, acting as dislocation obstacles, can concentrate the relatively low average dislocation densities typical of edge-defined film-fed grown ribbons (10^4 cm^{-2} to 10^6 cm^{-2}) to values which are sufficient to induce the formation of subgrain-like boundary structures.

30322 Photoconductivity and electronic doping effects in hydrogenated amorphous silicon. McMahon, T.J.; Madan, A. (Solar Energy Research Institute, 1617 Cole Blvd., Golden, Colorado 80401). *Journal of Applied Physics;* **57**: No. 12, 5302-5305(15 Jun 1985). Contract AC02-83CH10093.

The concept of electronic doping is used to explain unexpectedly large values of the diode quality factor (exceeding two) and supralinearity which is sometimes observed in amorphous silicon p-i-n-type diodes and materials, respectively. This suggests the presence of an extra set of defect states in lightly boron-doped films with a capture rate for electrons which is much larger than that of the inherent defect states. We also report that for high-quality undoped intrinsic layers, the photoconductivity versus intensity behavior exhibits sublinear power dependence which increases with intensity in distinct contrast to the previously reported results. We provide a self-consistent model which is able to explain the above observations.

30323 Recent results on hydrogen passivation of silicon sheet solar cells. Tsuo, Y.S.; Milstein, J.B. (Solar Energy Research Institute, Golden, Colorado 80401). *Journal of Applied Physics;* **57**: No. 12, 5523-5524(15 Jun 1985). Contract AC02-83CH10093.

Recent experiments have shown that the fill factor degradation of some hydrogen-passivated dendritic web solar cells we reported earlier [Y. S. Tsuo and J. B. Milstein, Appl. Phys. Lett. 45, 971 (1984)] is caused mainly by thin (less than 7 μm), damaged, front metal grids. A comparison of spectral response data for unpassivated and passivated cells shows that improvements occur mainly in the longer wavelength region, which indicates that bulk properties are enhanced by hydrogen passivation. We have also examined the stability of hydrogen-passivated dendritic web solar cells over a three month period under outdoor test conditions and have not found any degradation. Electron-beam-induced current data have been obtained that show the hydrogen passivation of dislocations as well as grain boundaries in edge-supported-pulling silicon sheet solar cells.

30324 Opportunities for high efficiency amorphous silicon thin film solar cells. Madan, A. (Chevron Research Co., Richmond, CA). pp 855-860 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Amorphous silicon based alloys have attracted a considerable amount of interest in the past few years because of their potential as inexpensive solar cells. The highest conversion efficiency so far reported exceeds 10%. However, some recent economic studies suggest that for a viable photovoltaic market, thin film solar cells would have to attain still higher conversion efficiencies. The authors review some of the basic properties of amorphous silicon based alloys and consider the multijunction stack arrays which provide a route toward the attainment of higher efficiencies.

30325 Annual performance analysis of series and independently connected A1GaAs/silicon stacked cells. King, D.L.; Siegel, R.B. (Sandia National Labs., Albuquerque, NM). pp 921-928 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

An analytical capability for calculating the annual performance of stacked, multijunction, multibandgap solar cells has been developed. Daily, site dependent variations in atmospheric air mass, turbidity and precipitable water were included in the model. The optimum bandgap combination for a two cell stack was about1.75 eV for the top cell and about1.1 eV for the bottom. An A1GaAs cell on a Si cell could provide this combination. This bandgap combination was optimum for both series and independently connected cells, and was also reasonably independent of the site evaluated. By using this combination, the annual penalty for series connecting the cells was less than 2% for typical Albuquerque atmospheric conditions. For ideal cell performance assumptions, the calculated annual efficiency at 200 suns illumination was approximately 41%. Using measured spectral response and cell transmittance data, representative of current cell technology, resulted in a calculated annual efficiency at 200 suns of approximately 25%.

30326 Fluorescence sensitization and quenching in a particulate chlorophyll model system. Seely, G.R.; Senthilathipan, V. (C.F. Kettering Research Lab., Yellow Springs, OH). pp 793-796 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The success of photosynthesis as an energy conversion process is largely owing to the manner in which the light-gathering and reaction center pigments are arranged within the thylakoid membrane. A particularly important condition in the construction of model systems based on these pigments is the need to avoid quenching of fluorescence until useful electron transfer takes place. In the model system under investigation, concentration quenching of chlorophyll is prevented by embedding the pigment molecules, along with certain amphiphiles, in the viscous hydrocarbon surface layer of swollen particles of polyethylene. Triplet state photoreactivity of chlorophyll on these particles can readily be demonstrated. Quinones such as Vitamin K_1 do not quench the fluorescence of chlorophyll even when incorporated at high concentration in the particles. But specially made amphiphiles, containing an amide group to ligate the Mg of chlorophyll, and a reducible group such as quinone, quench the fluorescence even at modest concentrations. The photochemistry of these systems is under investigation.

30327 Dendritic web photovoltaic module performance. Rose, C.M. (Westinghouse Electric Corp., Pittsburgh, PA). pp 817-824 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper contains a description of the design features of the dendritic web photovoltaic modules intended to achieve long life, low degradation performance. The design goal of the modules is a 20 year life with less than 5% performance degradation. A sufficient number of dendritic web photovoltaic modules have been built to allow an initial evaluation of routine performance levels and endurance characteristics of the design. Most of the data is related to accelerated endurance tests performed by the Jet Propulsion Laboratory to simulate 20 year life operation. In addition to these tests, actual operational data generated over a two year period by Pacific Gas and Electric Corporation indicates an as-yet unmeasurable amount of degradation. Based on these tests, it is concluded that dendritic web modules can achieve the endurance lifetime and degradation goals when operated under typical anticipated environmental conditions.

30328 EFG photovoltaic modules: construction and field experience. Tornstrom, E. (Mobil Solar Energy Corp., Waltham, MA). pp 825-830 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Mobil Solar has been manufacturing photovoltaic modules since 1978 and has had field installations since 1980. Module manufacturing methods and techniques have improved from a double glass silicone potting encapsulation to an EVA foil barrier lamination. Cell interconnection has progressed from an expanded copper mesh to a redundant copper tab system. External module connections have advanced from simple insulated flat copper strips exiting from the module sides to completely encapsulated power buses terminating at a multi-purpose weatherproof junction box. Mobil Solar has introduced the first large area module with high voltage capabilities for residences and intermediate load centers. Over the past 3 years, module areas have increased from 3 ft^2 to over 23 ft^2.

30329 Short rotation woody crops program. Ranney, J.W. (Oak Ridge National Lab., TN). pp 52 of Proceedings of the 1982 southern forest working group workshop. New Orleans, LA; Southern Forest Experiment Station (1982).

This program is concerned with new wood production techniques that attain high productivity levels. Sometimes known as short-rotation intensive culture, experimentation is concentrating on hardwood tree species that stump sprout and can be re-harvested every 3 to 10 years. Research focuses on the screening of fast-growing species and techniques of short-rotation wood crop management, although plant propogation, new wood recovery systems, and economic evaluations are within the scope of the program. The program's objective is to attain high productivity rates at competitive prices. Production systems vary across the United States depending on environment, species, and economic competition for resources. The major requirements of short-rotation intensive culture are improved stock, weed and pest control, fertilization, and sites of at least marginal quality for agriculture. Irrigation should generally be avoided for increasing productivity. Harvest and transport costs make up the greatest cost component of the system. In some locations it appears that short-rotation intensive culture is immediately competitive as an energy feedstock, although industrial acceptance is low. The concept of short-rotation intensive culture is being subjected to intense scrutiny to determine its viability and capability for improvement. Sensitivity analysis and/or field testing at over 30 universities and institutions are, or have been, under way, with significant results now coming to light. The concept is being tested to assist public/industrial evaluation and possible use as an energy source. Benefits for other uses are recognized as high.

30330 Emergent aquatic plants: biological and economic perspectives. Kresovich, S.; Wagner, C.K.; Scantland, D.A.; Lawhon, W.T. (Battelle Columbus Labs., OH). *Biomass;* **1:** 127-144(1981).

One of the most productive, but least exploited, biomass resources is the group classified as the emergent aquatic plants. Information is presented concerning the biological and economic factors that must be considered if emergent aquatic plants are to become viable feedstocks for multipurpose systems. The feedstock purposes highlighted include fuel and/or chemical production and the species identified as potential candidates for production in biomass systems include Arundo donax, Cyperus papyrus, Phragmites communis, Saccharum spontaneum, Spartina alterniflora, and Typha latifolia. If these species are to be viable candidates in biomass systems, a number of research areas must be investigated further. Issues such as the development of base-line yield data for managed systems, mechanization and harvesting conceptualization, genetic (crop) improvement, identification of secondary plant products, and economic considerations require refinement. However, the potential pay-off for developing emergent aquatic systems will be significant if successful. 19 references.

30331 (DOE/CE/30701—T1) SMUDPV1 quarterly performance report II, January-March 1985. Rosen, D. (Sacramento Municipal Utility District, CA (USA); Acurex Corp., Mountain View, CA (USA)). May 1985. Contract FC03-82CE30701. 26p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012802.

The performance of the photovoltaic plant is documented for the months of January, February, and March 1985. Performance trend data are given which provide relevant plant performance and weather data on a daily basis for the reporting period. Weather data, array performance, power conditioning unit performance, and net plant performance are graphed. Also discussed are specific operating and maintenance problems, their effect on plant operating time, and efforts conducted to resolve them. (LEW)

30332 (DOE/CE/30701—T2) Design and construction of the SMUDPV1 1-MW photovoltaic power plant. Final report I. Wool, M.R.; Rosen, D.J. (Sacramento Municipal Utility District, CA (USA); Acurex Corp., Mountain View, CA (USA)). Apr 1985. Contract FC03-82CE30701. 80p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85012241.

The Sacramento Municipal Utility District (SMUD), with cofunding from the US Department of Energy (DOE) and the California State Energy Resources Conservation and Development Commission (CEC), designed, procured, installed, and initiated operation of a nominal 1000 kilowatt power generating facility. The facility converts solar energy directly into electricity using flat plate photovoltaic modules which are mounted on modular single-axis tracking structures. The facility is located adjacent to the Rancho Seco Nuclear Generating Station, southeast of Sacramento, California. Design work began in 1982 and the plant began operation in August 1984. Direct current power from the 112 identical tracking structures is converted to 12.5-kV alternating current power by solid state power conditioning equipment. Overall conversion efficiency, sunlight to utility grid power, is between 8 and 10%. The plant is expected to generate 2.6 million kWh annually. The capital cost of the plant was $12.14 million.

30333 (DOE/ET/20624—T8) Airport solar photovoltaic concentrator, Phase III. Project status report No. ASPCP III-8, February 1, 1984-March 31, 1984. (Arizona Public Service Co., Phoenix (USA)). 9 Aug 1984. Contract AC04-80ET20624. 6p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85006777.

The objectives of the work reported were to operate and evaluate at the Phoenix Sky Harbor International Airport for two years a photovoltaic system consisting of an 80-array subsystem with a nominal rating of 225 peak kilowatts direct current output.

A new set of I-V data was taken on 20 arrays, and it was found that the peak power had decreased 3% from the readings taken when they were new. System operation and maintenance are reported. Progress is reported on isolating problems in the inverter and repairing them. (LEW)

30334 (DOE/ET/20624—T9) **Airport solar photovoltaic concentrator, Phase III. Project status report No. ASPCP III-9, April 1, 1984-May 31, 1984.** (Arizona Public Service Co., Phoenix (USA)). 28 Jan 1985. Contract AC04-80ET20624. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85006775.

The objectives of the work reported were to operate and evaluate at the Phoenix Sky Harbor International Airport for two years a photovoltaic system consisting of an 80-array subsystem with a nominal rating of 225 peak kilowatts direct current output. Operation and maintenance of the power conditioning system and array field are discussed and operating data are given. (LEW)

30335 (DOE/ET/20624—T10) **Airport solar photovoltaic concentrator, Phase III. Project status report No. ASPCP III-10, June 1, 1984-September 30, 1984.** (Arizona Public Service Co., Phoenix (USA)). 30 Jan 1985. Contract AC04-80ET20624. 6p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85006772.

The objective of the work reported was to operate and evaluate at the Phoenix Sky Harbor International Airport for three years a photovoltaic system consisting of an 80-array subsystem with a nominal rating of 225 peak kilowatts direct current output. It was decided to discontinue repairs to the power systems and control inverter, but to replace it. A lightning strike damaged several components in the array control panel. Appropriate surge suppressors were installed as repairs were being made. (LEW)

30336 (NP—5770191, pp 5.1-5.46) **Photovoltaics in the future Danish energy system.** Drud Nielsen, L. (Danmarks Tekniske Hoejskole, Lyngby. Fysisk Lab. 3). Jan 1984. (In Danish). NTIS (US Sales Only), PC A16/MF A01. File Number DE85770191.

EFP-81.

In Technological development and its impact on the future energy system. Appendix 1. Evaluation commissioned by the Danish Ministry of Energy.

The aim of the present account is to elucidate the long-term potentials of photovoltaic power generation in Denmark. A time horizon of fifty years has been adopted, but it is pointed out that actions taken already during the next few decades might influence the practical importance of photovoltaics in the long run. A number of background subjects are briefly treated, such as operating principles and manufacturing methods of photovoltaic solar cells, solar cells moduls, and complete photovoltaic systems. Technological possibilities of efficiency improvements and cost reductions are discussed, and U.S. DOE price and production goals are presented, as well as a European estimate of the future application markets. An account is given of Danish meteorological conditions, with calculation of area requirements and seasonal variations in mind. Also, problems concerning operating strategy, storage systems, exchange of energy with neighbour countries, etc. are briefly mentioned. Finally, it is optimistically concluded that up to 5% of the Danish electrical power consumption in the year 2030 might be supplied from photovoltaic systems, provided that the political will for such a development is at hand.

30337 (PNL—5483) **Photovoltaic industry progress through 1984.** Watts, R.L.; Smith, S.A.; Dirks, J.A. (Pacific Northwest Labs., Richland, WA (USA)). Apr 1985. Contract AC06-76RL01830. 102p. NTIS, PC A06/MF A01; GPO Dep. File Number DE85013029.

The growth of the US photovoltaics (PV) industry over the past decade has been impressive. First designed to provide power for satellites using high-cost production techniques, PV is now the economical choice in many remote terrestrial applications. The remarkable growth of PV in terms of quality of cells and modules, production techniques, and system design, was initiated by a cooperative effort of the US Government and the domestic PV manufacturers. European and Japanese firms entered the PV industry later, but are also growing rapidy. The Europeans continue to supply PV systems for village electrification and water pumping to many Third World countries. The Japanese have been developing the amorphous silicon (A-Si) technology by expanding its use in consumer goods. The world PV industry saw dramatic changes in industry ownership and in the emphasis on developing new and improved technology during 1984. The objective of this report is to present information on the developments of the world PV industry and focuses on developments occurring in 1984. Information is presented on a regional basis (US, Europe, Japan, other) to avoid disclosing company-confidential data. All information was gleaned from several sources, including a review of the technical literature and direct contacts with PV manufacturers. Prior to publishing the regional totals, all numbers were compared with those of other sources. The information contained in this report is prepared for use by the Department of Energy for their use in long-term R and D planning. However, this information should also be of interest by PV manufacturers and to those who may be contemplating entering the PV market. PV shipments for 1984, government supports for PV, and various PV market sectors are discussed.

30338 (SAND—84-2530) **Estimating wind speed as a function of height above ground: an analysis of data obtained at the Southwest Residential Experiment Station, Las Cruces, New Mexico.** Menicucci, D.F.; Hall, I.J. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 24p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013262.

Thermal modelling of photovoltaic arrays requires accurate estimates of wind speed at the level of the arrays. Wind speed data are normally recorded by an anemometer at the 30-foot level. To estimate the relationship between wind speed and height, wind speed data were acquired at various heights in the range of 10 to 30 feet and a nonlinear regression analysis was performed. This analysis shows that, over the range of conditions covered by the present data, the predictive relationship given by the Mechanical Engineer's Handbook is quite accurate; wind velocity can generally be estimated to within +-1.5 mph.

30339 **First-year operational results for the Dallas-Fort Worth Airport linear fresnel lens photovoltaic/photothermal system.** O'Neill, M.J.; Muzzy, D.B. (E-Systems Inc., Dallas, TX). pp 865-876 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Since June 1978, E-Systems has been developing a combined photovoltaic/photothermal (PVT) power system for the Dallas-Fort Worth (DFW) Airport, under the U.S. Department of Energy's Photovoltaic Application Experiments program. In this paper, a brief description of the system is presented, the performance of the linear Fresnel lens PVT collector module will be provided, the full system performance for the first seven months of continuous operation (September 1982 through March 1983) is presented in detail, a comparison of the measured versus predicted system performance will be shown, and data confirming the reliability and durability of the system are given.

30340 **The ARCO 1 megawatt Photovoltaic Power Plant.** Rhodes, G.W. (BDM Corp. Albuquerque, NM). pp 815 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The world's largest Photovoltaic Power Plant is in operation on the SCE grid near Hesperia, California. The 1 MW plant designed and constructed by the BDM Corporation, for ARCO Solar Inc., occupies a 20 acre site adjacent to the Southern California Edison (SCE) Lugo substation. The entire design and construction process took 7-1/2 months and was not only on schedule but below budget.

30341 **Economic aspects of photovoltaic power generation for the utility industry: the third-party financing option.** Leonard, S.L.; Munjal, P.K. (Aerospace Corp.). pp 881-892 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper presents the results of an investigation of third-party financing as a method of funding the construction of MW-scale photovoltaic power plants for electric utility service. A description is given of the analysis methodology, which takes into account the provisions of such recently-enacted legislation as the Economic Recovery Tax Act of 1981 and the Tax Equity and Fiscal Responsibility Act of 1982, and the evaluation of a reference case is described. The results are expressed in terms of the "allowable" plant cost, the largest value for the total cost of constructing the plant that will yield the required after-tax return on equity. The sensitivity of the reference-case results to the more critical of the economic assumptions is then explored in detail. For a range of reasonable, if optimistic, values for the economic parameters, photovoltaic power plants costing $4-8/W /sub p/ are shown to be potentially attractive investments for properly structured third-party ventures. The paper also discusses the principal factors that currently inhibit the formation of such ventures.

30342 **First year operation of the Phoenix Sky Harbor solar photovoltaic concentrator project.** Lepley, T.C.; McGuirk, W.J. (Arizona Public Service Co., AZ). pp 877-880 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This project, one of four concentrator system application experiments sponsored by DOE's PRDA-35 Program, first delivered solar generated electricity in April 1982. The 225 peak kW array field is comprised of 80 Martin Marietta "first generation" passively cooled tracking arrays, which feed a Power Systems and Controls inverter. The ac power output is stepped up to 12.5 kV and fed directly into the APS power grid at the airport site. The Martin concentrator module design is identical, with minor exceptions, to the hardware supplied to the 350 kW Saudi Arabian Village project under the SOLERAS program. Each concentrator uses a Fresnel lens to focus energy (36X) onto a 2.25 in. diameter silicon solar cell. A total of 272 lens-cell combinations are mounted onto a pedestal mounted two-axis tracking array structure. The system was constructed at a cost of approximately $4 million. The initial operating experience has been generally favorable although several problem areas have been identified. The first year's net dc energy production was 295,000 kWh, about 60% of the amount expected from predictive models. A significant factor in the low ouput was the below average amount of direct insolation received at the site.

30343 **The Lovington Square shopping center photovoltaic system.** Wabrek, R.; Risser, V. (New Mexico State Univ., Las Cruces, NM). pp 861-864 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Since March 1981, a 100 kW flat-plate photovoltaic system has been generating electricity in Lovington, New Mexico. Interconnected with the Lea County Electric Cooperative distribution grid, the energy produced is used by a shopping center located approximately 0.5 mile east of the photovoltaic array. In 1982 the photovoltaic system supplied approximately 8% of the electrical needs of the shopping center. The system availability is more than 99%, with average monthly production of 17,500 kW hours of dc electricity. After conversion to 480 volts ac power, the energy is sold for approximately $750 per month. The system operates automatically and the site is unattended except for a walk-through conducted several times per week. Although the cost of such systems is still high, the Lovington project has demonstrated that photovoltaic systems have many desirable attributes. System description and performance are presented.

30344 **The limits of photovoltaic conversion efficiency- a review.** Stone, J.L. (Solar Energy Research Inst., Golden, CO). pp 847-854 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

If photovoltaics is to gain widespread acceptance and become a viable part of the energy mix for this country, its cost-performance characteristics must be improved beyond where they are today. In particular, this translates into lower cost, higher efficiency, and longer life expectancy. Depending on the energy cost target, windows of opportunity exist which define the performance requirements. This paper examines the value of efficiency as related to making photovoltaics competitive with conventional electricity generating options and reviews the theoretical limits imposed on photovoltaic devices. Several approaches are examined which have potential for greater than 30% conversion efficiency and the current status of this development is reviewed.

30345 **Second-generation linear fresnel lens concentrating photovoltaic collectors.** O'Neill, M.J.; McDanal, A.J.; Waller, R.A. (E-Systems, Inc., Dallas, TX). pp 837-845 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

From 1977 through 1979, E-Systems developed a first-generation linear Fresnel lens concentrating photovoltaic collector system. This system is exemplified by the 27 kw (electric)/140 kw (thermal) Dallas-Fort Worth Airport photovoltaic/photothermal system, which we are currently operating and evaluating under the U.S. Department of Energy's Photovoltaic Application Experiments program. Although this first-generation system is operating at excellent electrical and thermal efficiency levels, its performance and costeffectiveness are far from optimal. From 1980 through 1983, we have been developing a second-generation linear Fresnel lens concentrating photovoltaic collector system, which offers significantly higher performance at substantially reduced cost. The secondgeneration Fresnel photovoltaic concentrator system employs a new collector module design and a new array configuration. The new collector module design allows for either active (forced convection of liquid) cooling or passive (natural convection of air) cooling of the photovoltaic receiver, depending upon application requirements. The new array configuration minimizes expensive field labor by fully assembling the array in the factory. In this paper, the second-generation collector modules is described, the array configuration and operation is discussed, and the performance of both the actively and passively cooled modules are provided.

30346 **Technical aspects of future photovoltaic power systems.** Jones, G.J. (Sandia National Lab, Albuquerque, NM). pp 893-898 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Future photovoltaic systems will need to be designed to increase acceptance by the potential system owner as well as the host utility. Such systems will maximize their output of high signal quality electricity to the utility through a safe and controlled interconnection, while minimizing the total cost to the owner. These future systems will emphasize the use of modular array field designs and state-of-the-art power conditioning equipment in all applications and tracking collectors wherever practical. These future systems will be designed as a supplier of energy to the utility and only in the residential case will PV be co-located with a load. The major remaining hardware developments necessary to obtain these systems are in the areas of modular residential array design, modular tracking flat-panel field development, and central station power conditioning definition.

1407 Solar Thermal Power Systems

30347 **(DOE/CE—0110) Solar thermal technologies program summary.** (Conservation and Renewable Energy Inquiry and Referral Service, Silver Spring, MD (USA)). May 1985. 3p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012253.

Report FS 196, 1st edition.

The primary applications being developed in solar thermal technology are the production of electricity and industrial process heat. Additional applications, such as the production of a transportable fuel, are also being studied to determine their feasibility. Two collector concepts are being examined: central receiver and distributed receiver. Some significant achievements are briefly described, as well as program goals and strategies. The research plan for the 1984 fiscal year is also briefly discussed, including a summary of the budget. (LEW)

30348 **(FRNC-TH—1887) Design and construction of a small gas turbine for solar energy conversion. Modeling the system operation in transient conditions.** Leone, J.F. (Institut National des Sciences Appliquees (INSA), 69 - Villeurbanne (France)). 1982. 182p. (In French). NTIS (US Sales Only), PC A09/MF A01. File Number DE85751581.

The aim of this work is the design, the construction and the study of the operation of a small gas turbine for a solar power plant with dispersed collectors. The essential points are the choice of the motor and energy economizer elements as also the experiment leading to the knowledge of the solar power conversion machine possibilities. Advantages and disadvantages with regard to other more classical generating systems are pointed out. A complete modeling allows to define the effects of different parameters on the behavior of the installation as well for nominal operating conditions as for transient conditions. A prediction of the cost price of the electricity produced by such plants is established.

30349 **(PNL—5463) Long-terms goals for solar thermal technology.** Williams, T.A.; Dirks, J.A.; Brown, D.R. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 107p. NTIS, PC A06/MF A01; GPO Dep. File Number DE85013032.

This document describes long-term performance and cost goals for three solar thermal technologies. Pacific Northwest Laboratory (PNL) developed these goals in support of the Draft Five Year Research and Development Plan for the National Solar Thermal Technology Program (DOE 1984b). These technology goals are intended to provide targets that, if met, will lead to the widespread use of solar thermal technologies in the marketplace. Goals were developed for three technologies and two applications: central receiver and dish technologies for utility-generated electricity applications, and central receiver, dish, and trough technologies for industrial process heat applications. These technologies and applications were chosen because they are the primary technologies and applications that have been researched by DOE in the past. System goals were developed through analysis of future price projections for energy sources competing with solar thermal in the middle-to-late 1990's time frame. The system goals selected were levelized energy costs of $0.05/kWh for electricity and $9/MBtu for industrial process heat (1984 $). Component goals established to meet system goals were developed based upon projections of solar thermal component performance and cost which could be achieved in the same time frame.

30350 **(SAND—80-8192-Vol.1) Molten Salt Thermal Energy Storage Subsystem Research Experiment. Volume I. Executive summary.** (Martin Marietta Aerospace, Denver, CO (USA)). May 1985. Contract AC04-76DR00789. 46p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013194.

This report documents work sponsored by the US Department of Energy to design, build, and test a thermal storage subsystem research experiment using molten nitrate salt as the working fluid. The project is part of a continuing program to develop molten salt components and subsystems for central receiver systems. The work was performed by Martin Marietta Aerospace in association with American Technigaz Inc., Arizona Public Service Company, and Stearns-Roger under DOE Contract 20-2988. The design is based on a two tank system, one tank to hold cold (550°F) salt and one to hold hot (1050°F) salt. The cold tank is a conventional design with a carbon steel wall and external insulation. The hot tank employs new technology: it has firebrick insulation internal to a structural shell, with a corrugated liner inside the insulation to contain the salt. The liner is similar to those used in transportation and storage of liquid natural gas. The testing showed that this concept of thermal storage is technically feasible and potentially cost effective. The contract began in November 1980 and testing was completed in August 1982. This report is in two volumes: Volume I is an Executive Summary which gives highlights of the projects. Volume II is the full technical report covering the same information in greater detail.

30351 **(SAND—80-8192-Vol.2) Molten Salt Thermal Energy Storage Subsystem Research Experiment. Volume II. Final technical report.** (Martin Marietta Aerospace, Denver, CO (USA)). May 1985. Contract AC04-76DR00789. 328p. NTIS, PC A15/MF A01. File Number DE85013363.

This report documents work sponsored by the US Department of Energy to design, build, and test a thermal storage subsystem research experiment using molten nitrate salt as the working fluid. The project is part of a continuing program to develop molten salt components and subsystems for central receiver systems. The work was performed by Martin Marietta Aerospace in association with American Technigaz Inc., Arizona Public Service Company, and Stearns-Roger. 30352 **(SAND—84-8192) Experimental study of free and mixed convective flow of air in a heated cavity.** Humphrey, J.A.C.; Sherman, F.S. (California Univ., Berkeley (USA). Dept. of Mechanical Engineering). Apr 1985. Contract AC04-76DR00789. 292p. NTIS, PC A13/MF A01; 1; GPO Dep. File Number DE85012538.

Free and mixed convection in a strongly-heated rectangular open cavity have been investigated experimentally, to observe the effects of cavity shape and inclination, and of ambient wind, on the velocity and temperature distribution were observed. The long edges of the cavity were horizontal, and parallel to an axis around which the cavity could be rotated. The aperture plane was either vertical ($\alpha = 0^\circ$), or inclined downward at α - 20° or $\alpha = 45^\circ$. The height of the aperture, b, was always 0.0947 m, while the depth of the cavity, a, was set so that a/b = 0.5, 1.0, or 1.46. The bottom and back walls were electrically heated - the top wall was indirectly heated by conduction, radiation and convection. The average wall temperature and the ambient temperature were used to define the dimensionless overheat and Grashof numbers. The Prandtl number was that of air. In the studies of mixed convection, the axis of rotation was horizontal and normal to the ambient wind. The Reynolds number was varied from Re = 120 - 1100 to Re = 2000 - 8740. For both free and mixed convection, wall and gas temperature were measured with thermocouples, and shadowgraph pictures were taken. For pure free convection, three time-averaged velocity components, the corresponding normal Reynolds stress components, and one off-diagonal Reynolds stress component were measured with a two-color laser-Doppler velocimeter. A PDP-11/34 minicomputer controlled the sequence of automatic data acquisition, the statistical data reduction and its storage. Statistical results are presented numerically and graphically for two averaging procedures. The principal quantitative result for free convection is that the rate of convective heat loss across the cavity aperture plane is reduced both by increasing a/b and by increasing α. Qualitative observations are recorded and discussed. The most striking observation was the appearance of a periodic oscillation of frequency 2 to 5.5 Hz.

30353 (SAND—85-8224) **Monograph series No. 2: 10 MWe Solar Thermal Central Receiver Pilot Plant and receiver performance evaluation.** Baker, A.F.; Atwood, D.L. (Sandia National Labs., Livermore, CA (USA)). May 1985. Contract AC04-76DR00789. 54p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85012536.

The plant and receiver performances of the 10 MWe Solar Thermal Central Receiver Pilot Plant located in Barstow, California, are evaluated based on measured and calculated data. An extended data base is used to update the receiver performance reported in March 1983. Full and part load results and trends in receiver performance when operating at varying outlet temperatures and pressures are provided. The plant and receiver performances are compared to design predictions. Data are included for both points in time and average values of performance.

30354 **Solar One project.** DeHaven, N.J. (Southern California Edison, Rosemead, CA). pp E-5-E.5.6 of 1980 Transactions of the American Association of Cost Engineers. Morgantown, WV; American Association of Cost Engineers (1980). (CONF-8007136—).

From 24. annual meeting of the American Association of Cost Engineers; Washington, DC, USA (6 Jul 1980).

This paper describes a US DOE-sponsored project to build a 10 MW central receiver pilot plant at Southern California Edison's Cooling Water Generating Station. The objectives of the pilot plant are to establish the technical feasibility of solar thermal power plants of the central receiver type, to develop sufficient development, production, operating and maintenance cost data to indicate the potential for the economical operation of commercial power plants of similar designs, and to determine the environmental impact of solar thermal central receiver plants. Topics considered include the heliostats, the receiver, the thermal storage system, the turbine generator facility, the master control system, construction management, funding arrangements, cost estimation, the schedule, and the future cost of solar plants. It is concluded that the 10 MW solar thermal central receiver pilot plant will provide hard experience relating to the cost of designing and constructing a solar thermal central receiver electric generating station.

1409 Solar Thermal Utilization

REFER ALSO TO CITATION(S) 30276, 30279, 30285, 30286, 30287, 30287, 30288, 30289, 30290, 30291, 30294, 30347, 30349, 30550, 30557, 30559, 30560, 30565, 31206, 31219, 31220, 31226, 31259, 31265, 31281, 31297, 31298, 31299, 31311, 31313, 31316, 31317, 31318, 31320, 31321, 31355

30357 (BFR-R—30-1983) **Combined solar and surface earth heating for a small group of houses in Perstorp. Results of three years performance monitoring.** Gusten, J.; Baeckberg, H. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1983. 51p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750849.

The paper discribes a combined surface-soil and solar heating system for a group of five detached houses. The purpose of the work is to study the economy and the dependability of the system. The amount of consumption of electric energy needed for the heating of the houses and the hot water is also examined. The heat-installation system was expected to reduce the energy consumption for heating and hot water by 50 to 60 percent. However, for several reasons the results indicate considerably lower saving. The amount of energy available from the solar and the ground system has been insufficient due to malfunctioning of the heat pumps and in consequence, the elctric battery has been in operation for longer periods than desired. Besides, the losses from the culvert have been larger than calculated.

30358 (CONF-850240—4) **Construction and initial operation of a seasonal solar cooling system.** Harkness, J.B.L. (Argonne National Lab., IL (USA)). Feb 1985. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85009739.

From Alternative energy in the Midwest: research and applications; Schaumburg, IL, USA (21 Feb 1985).

A solar ice-making system based on an Argonne National Laboratory design is considered for home cooling. The water-based storage system, which is a plain concrete tank, was integrated into the foundation of the house. Freon-12 is the working fluid used in the ice-making system. Several modifications were made in the system and brief discussions about these changes are presented. An itemized cost report of the project is included along with drawings for the layout of the system. (BCS)

30359 (CONF-850388—10) **New directions for building thermal storage.** Tomlinson, J.J. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 6p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012779.

From Solar buildings: realities for today - trends for tomorrow; Washington, DC, USA (18 Mar 1985).

The thermal and economic value of incorporating phase change materials (PCMs) as layers in building walls and floors has been determined for a simple, one-room passive solar building through a series of simulations using the analysis code PCMSOL. It was found that the economic value of latent heat storage is strongly affected by the cost of fuel used for supplemental heating, as well as the application (PCM retrofit or PCM incorporated during building construction). Optimal PCM thermophysical property requirements were determined for PCMs located on the floor and walls of a direct gain building and for PCMs used as a Trombe wall, and an allowable storage cost for PCM storage systems was developed. The paper concludes with recommendations concerning PCM research and development for passive solar building heating.

A teaching manual is provided to aid teachers in introducing renewable energy topics to earth science students. The main emphasis is placed on solar energy. Activities for the student include a study of the greenhouse effect, solar gain for home heating, measuring solar radiation, and the construction of a model solar still to obtain fresh water. Instructions for the construction of apparatus to demonstrate a solar still, the greenhouse effect and measurement of the altitude and azimuth of the sun are included. (BCS)

30364 **(DOE/CS/34039—T10) Solar Energy Education. Industrial arts: student activities. Field test edition.** (New York State Dept. of Education, Albany (USA). Solar Energy Project). Feb 1981. Contract AC01-77CS34039. 138p. Solar Energy Project, c/o Curriculum Services, New York State Education Dept., Albany, NY 12234. File Number TI85010363.

In this teaching manual several activities are presented to introduce students to information on solar energy through classroom instruction. Wind power is also included. Instructions for constructing demonstration models for passive solar systems, photovoltaic cells, solar collectors and water heaters, and a bicycle wheel wind turbine are provided. (BCS)

30365 **(DOE/CS/34039—T11) Solar Energy Education. Home economics: student activities. Field test edition.** (New York State Dept. of Education, Albany (USA). Solar Energy Project). Mar 1981. Contract AC01-77CS34039. 144p. Solar Energy Project, c/o Curriculum Services, New York State Education Dept., Albany, NY 12234. File Number TI85010362.

A view of solar energy from the standpoint of home economics is taken in this book of activities. Students are provided information on solar energy resources while performing these classroom activities. Instructions for the construction of a solar food dryer and a solar cooker are provided. Topics for study include window treatments, clothing, the history of solar energy, vitamins from the sun, and how to choose the correct solar home. (BCS)

30366 **(DOE/CS/34039—T12) Solar Energy Education. Home economics: teacher's guide. Field test edition.** (New York State Dept. of Education, Albany (USA). Solar Energy Project). Jun 1981. Contract AC01-77CS34039. 34p. Solar Energy Project, c/o Curriculum Services, New York State Education Dept., Albany, NY 12234. File Number TI85010361.

An instructional aid is provided for home economics teachers who wish to integrate the subject of solar energy into their classroom activities. This teacher's guide was produced along with the student activities book for home economics by the US Department of Energy Solar Energy Education. A glossary of solar energy terms is included. (BCS)

30367 **(DOE/CS/34039—T13-Pt.3) Solar Energy Education. Solar solutions: Reader, Part III.** (New York State Dept. of Education, Albany (USA). Div. of Curriculum Services). May 1981. Contract AC01-77CS34039. 193p. Solar Energy Project, c/o Curriculum Services, New York State Education Dept., Albany, NY 12234. File Number TI85010360.

A collection of magazine articles which focus on the subject of solar energy is presented in this booklet. This is the third of a four part series of the Solar Energy Reader books. The articles provide brief discussions on the various applications of solar energy including: heat, photovoltaics; wind, hydro, and biomass. A glossary of terms is included. (BCS)

30368 **(DOE/CS/34039—T14) Solar Energy Education. Industrial arts: teacher's guide. Field test edition.** (New York State Dept. of Education, Albany (USA). Solar Energy Project). May 1981. Contract AC01-77CS34039. 34p. Solar Energy Project, c/o Curriculum Services, New York State Education Dept., Albany, NY 12234. File Number TI85010364.

An instructional aid is presented which integrates the subject of solar energy into the classroom study of industrial arts. This guide for teachers was produced in addition to the student activities book for industrial arts by the USDOE Solar Energy Education. A glossary of solar energy terms is included. (BCS)

30369 **(DOE/ET/10737—T1) Demonstration of integrated appropriate technology applied to urban aquatic production farms. Final report.** Tang, A.C. (Waterlife West, Inc., San Diego, CA (USA)). [1985]. Contract FG03-78ET10737. 12p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012217.

Under this project progress was made towards proving and implementing energy-efficient appropriate technologies in urban aquatic food production. An aquatic food production facility incorporating a solar hatchery and nine outdoor ponds has been completed, and initial tests on the suitability for commercial production of freshwater shrimp, channel catfish, and water chestnut have been performed. The major problem encountered involved obtaining the necessary government permits to build and operate the facility. Future enterprises would benefit tremendously by a prudent streamlining of these permit procedures.

30370 **(DOE/R0/00047—T1) Gearhart fire station passive solar retrofit, City of Gearhart.** (Oregon Appropriate Technology, Inc., Eugene (USA); Rain Umbrella, Inc., Portland, OR (USA)). [1985]. Contract FG06-79R000047. 14p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013420.

The objective of the retrofit project was to bring the fire station up to current codes and standards for insulation and weather tightness. Because of the unobstructed southern orientation of the four garage doors, it was thought possible to replace the existing solid wood doors with glazed ones and to utilize basic passive solar principles, providing direct gain with the concrete slab floor and the fire vehicle water tanks functioning as thermal mass for heat storage. The project was designed to offer hands-on retrofit experience to those in the community who had an interest in solar technology, but who did not necessarily have a technical background. (LEW)

30371 **(DOE/R8/00448—T1) Farm shop thermo-syphon collector. Final report.** Storhaug, L.W. (Storhaug (Leslie W.), Zahl, ND (USA)). [1985]. Contract FG48-79R800448. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011337.

The design and construction of a thermo-syphon solar collector are briefly described. The collector works on the principle of natural convection, and it was built to provide supplementary heat for a farm shop. A constant, above freezing temperature is the desired effect of the heater. (BCS)

30372 (DOE/R8/06041—T1) **[Solar heat pump]. Final report.** Hermanson, R. (Viking Engineering, Garretson, SD (USA)). [1985]. Contract FG48-81R806041. 18p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011323.

Brief discussions of the major components of a solar powered, chemical ground source heat pump are presented. The components discussed are the solar collectors and the chemical heat storage battery. Sodium sulfide is the medium used for heat storage. Catalog information which provides a description of all of the heat pump system is included. (BCS)

30373 (DOE/R9/50014—T1) **Instrumented performance study of a passive solar heated earth sheltered residence.** Yarnell, R.C.; Yarnell, B.K. (Yarnell (Richard C.), Carson City, NV (USA); Yarnell (Barbara K.), Carson City, NV (USA)). Jan 1983. Contract FG03-80R950014. 34p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012215.

This paper reports the results of a one year effort to gather performance data on an earth sheltered, passive solar house located in Carson City, Nevada. Automatic equipment logged insolation and temperature data for a one (1) year period commencing shortly after completion of construction of the structure and its occupancy by the owners. The use of a recording micrologger reflects an effort to obtain unbiased, factual data on the performance of the house and to reduce the impact of subjective perceptions of the occupants' comfort on the report. Raw data was gathered continuously. A pyranometer measured the amount of whole sky solar radiation. Results were recorded as Btu's per square foot. Thermistors measured temperatures of: (a) outdoor ambient air, (b) indoor living room ambient air, (c) indoor greenhouse ambient air, (d) dining room mass wall, (e) greenhouse mass wall, (f) perimeter earth-sheltered wall, and (g) solar heated DHW storage tank. An event counter recorded user operated insulating adjustments (raising and lowering of insulating of curtains) and auxiliary heating (building or stoking a fire in the wood burning stove).

30374 (DOE/SF/11919—T2) **Determination of properties of zeolite/refrigerant combinations for solar refrigeration systems. Final report.** (Collier Engineering Services, Cave Creek, AZ (USA)). [1985]. Contract AC03-83SF11919. 47p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012009.

The determination of properties of zeolite/refrigerant combinations of solar refrigeration systems are reviewed in this final report. The US DOE has funded several studies aimed at identifying potential rerigerant/absorption pairs for solar cooling applications. In the case of this report, the absorbent was already chosen (natural zeolite), but criteria of toxicity and heat of vaporization were common among projects. There were three very important criteria studied in this report which were not involved in the other studies. First, a lower evaporator temperature is used in this study than is typical of space cooling applications; second, the effects of molecule size on the system; and third, is the effect of the weight loading differential per unit mass of absorbent.

30375 (FRNC-TH—1883) **Microordinator controlled measuring station for studying the materials of solar system components.** Hamada, H. (Toulouse-3 Univ., 31 (France)). 1982. 155p. (In French). NTIS (US Sales Only), PC A08/MF A01. File Number DE85751589.

All the interfaces making up the data acquisition system and specification of the techniques implemented in its realization are described. The electronic development tool and the development of the computing section (software) are examined. This is then applied to the study of the solar installation for the production of hot water in the restaurant at I.N.S.A. (1500 l/day on average). An analysis is finally developed with a view to optimizing the energy yield of this installation.

30376 (FRNC-TH—1885) **Low temperature techniques for drying sorghum with solar energy: experimentation and micro-computer simulation.** Soponronnarit, S. (Institut National Polytechnique, 31 - Toulouse (France)). 1982. 97p. (In French). NTIS (US Sales Only), PC A05/MF A01. File Number DE85751591.

Sorghum was dried at a low temperature in 200 litre chambers using various techniques which were compared. Technically the most satisfactory method was continuous ventilation using solar energy on other energy source. 3 simple simulation models were selected and their accuracy was tested with a microcomputer using the hourly experimental readings. Results were even more precise if a correction was made in the thin layer drying equation for the drying air velocity. Mean values over 24 hours of readings taken every hour and every hours were also acceptable.

30377 (FRNC-TH—1886) **Keeping experimental track of Bassens solar houses. Thermal and economical aspects.** Taillandier, F. (Institut National des Sciences Appliquees (INSA), 31 - Toulouse (France)). 1982. 13p. (In French). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751588.

Five detached houses, with the same architecture features and 89 sq.m net dwilling surface fitted with either active or passive heating systems or with insulated walls are described. A comparative study of the thermal balances of these houses over a whole heating season is presented. The profitability assessment of the various systems by the calculation of solar extra cost payback through achieved energy saving has been finally established.

30378 (FRNC-TH—1888) **Real site study of a solar passive house with long time heat storage in the ground.** Fabre, J. (Toulouse-3 Univ., 31 (France)). 1982. 129p. (In French). NTIS (US Sales Only), PC A07/MF A01. File Number DE85751587.

A description of the house with passive solar heating which uses an adjoining greenhouse to store heat in the ground is first given. The system was installed at Ramonville St. Agne near Toulouse. Long term thermal balances have been established, thermal comfort has been studied and the various energy supply systems have been evaluated, with proposals for possible improvements. A simulation of storage in the ground using the heat equation in the variable regime and a finite differences method is then presented. Heat transfers by conduction, convection and radiation in the premises for the construction of a model simulating the house have been finally studied.

30379 (FRNC-TH—1902) **Milk pasteurization using solar energy.** Song Hyun Kap. (Ecole Nationale Superieure des Arts et Metiers, 75 - Paris (France)). 1982. 194p. (In French). NTIS (US Sales Only), PC A09/MF A01. File Number DE85751582.

The aim of this work was the design, the construction and testing of a prototype milk pasteurization unit using solar energy with an output of 60 l/h. The present work includes four parts: 1) choice of a milk pasteurization; 2) mounting of the system and testing; 3) analysis of the parabolic through collector efficiency; 4) and modeling of the boiler and cooling circuits.

30380 (LA-UR—85-887) **Vapor phase heat transport concepts.** Neeper, D.A.; Hedstrom, J.C. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 8p. (CONF-850388—4). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85009550.

From Solar buildings: realities for today - trends for tomorrow; Washington, DC, USA (18 Mar 1985).

The evolution of the vapor transport concept is briefly discussed. Some of the previous vapor transport designs are presented and include: a vertical collector operating in the percolating mode, a heat pipe, and a self-pumping system. The importance of the heat transfer from the accumulator is considered. Two accumulators are used in conjunction with a solar collector and a condenser in the new vapor system. This new system requires no external cooling and a schematic diagram of the system is provided. (BCS)

30381 (MRI/SOL—0601, pp 255-260) **Alternative energies and combinations of them.** Roth, P. (Universidad Tecnica Federico Santa Maria, Valparaiso, Chile). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

This overview of the activities of the Mechanical Department of the Santa Maria University, Valparaiso, Chile informs about the main projects of the Solar Energy Laboratory. The Laboratory began its work in the field of solar radiation measurement. Later on, activities in water heating, distillation, cooling, greenhouses, concentrators and wind energy followed. By now, industrial projects and research work in several fields are done. The actual projects deal mainly with combinations of energies. These projects are briefly described.

30382 (MRI/SOL—0601, pp 1-18) **Absorption systems.** Wilbur, P.J. (Colorado State Univ., Fort Collins). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

The physical principles of absorption cooling system operation are described and a simple analytical model describing the operation of these devices is presented. Heat transfer and pumping power computations are presented for a typical unit. The tendency for the devices to operate at a nearly constant coefficient of performance as the hot storage supply and heat rejection temperatures are varied over moderate ranges is discussed. The tendency of the units to exhibit a linear variation in cooling capacity as the hot storage supply and heat rejection temperatures are varied is also reviewed.

30383 (MRI/SOL—0601, pp 19-32) **Refrigerants for absorption systems.** Merrick, R.H. (Arkla Industries, Evansville, IN). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

The qualities of refrigerant/absorbent combinations for practical absorption cycles are reviewed to establish an understanding of why only lithium bromide/water and ammonia/water have become commercialized. Lithium bromide/water is identified as the choice for solar cooling with existing absorption technology. The history of solar absorption hardware is covered from the first serious activity in 1973 through current experimental work. The interrelation of the chiller and the solar system is discussed as regards flat plate collectors, high temperature collectors, air cooled heat rejection and storage options. The value of the unitary approach is established and these developments described. Current work to develop an air cooled refrigerant/absorbent combination to fire in the 110° to 115°C range is covered. Development of an evaporatively cooled bromide unit as an alternative to air cooling is discussed.

30384 (MRI/SOL—0601, pp 33-56) **Passive solar cooling.** Sabbagh, J.A. (King Abdulaziz Univ., Jeddah, Saudi Arabia). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

Passive cooling was applied for generations by builders. However, modern buildings depend completely on mechanical air conditioning. Researchers recently started to look back for passive cooling due to the rising cost of energy. The factors which are involved in passive solar cooling are analyzed. Among those factors are human comfort, its limits, and its interrelation with the conditions of the environment. The methods of reducing buildings heat gain from solar radiation and other sources are discussed. Air movement inside and outside buildings are also discussed. A study of the methods of heat rejection from buildings to the environment and to the soil is discussed. Examples of the methods and devices which were applied in traditional buildings for passive cooling as well as the new concepts and research are given.

30385 (MRI/SOL—0601, pp 57-72) **Solar Rankine cycle system.** Nazer, M. (Univ. of Petroleum and Minerals, Dhahran, Saudi Arabia). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

Solar energy systems for various energy consuming applications are appearing more and more in the market as the worldwide shortage of conventional energy sources continue. Promising results indicated by recent research activities show that active solar cooling systems will be commercially available in the near future. Two major systems are being considered: Absorption Refrigeration Systems and Rankine Cycle Refrigeration Systems. A description of the Rankine cycle system and principles of operation of the various components is presented. Design and evaluation of several recent development programs are discussed, as well as economics of one of these projects.

30386 (MRI/SOL—0601, pp 73-88) **Assessment of working fluids for Rankine solar cooling systems.** Wali, E. (Univ. of Petroleum and Minerals, Dhahran, Saudi Arabia). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

The results of an investigation of possible working fluids suitable for the solar, Rankine-cycle, cooling of buildings are presented. The Underwriter's safety requirements, system operating reliability and fluid thermal stability were the primary factors used in the screening process. Although minimum development problems would appear to exist when using steam, a low power level, multistage turbine, having a high degree of superheat, would run at excessive shaft speed resulting in high turbine disc stresses. Among the various organic fluids considered, including those proposed for various prototype developments presently in progress, only the halocarbon compounds R-11, R-113 and R-114 and the fluorinert compounds FC-75 and FC-88 satisfied safety requirements. Their two-phase pressure drops per unit length, mean two-phase heat transfer coefficients and the maximum allowable heat flux were determined for Reynolds numbers of 10000 to 120000 at an average, fully-developed, liquid-phase velocity of 1.22 m/s, and 16.6 mm inside tube diameter. A preliminary assessment based on these results, and those available of static, thermal stability tests together with the values of the vapor pressures in the condensing temperature range and the boiling points, is presented. It indicates that R-113 followed by FC-88 are the most suitable fluids for such application. A final assessment, however, should be based on dynamic thermal stability tests, where boiling, condensing and other stresses are imposed on the fluids.

30387 (MRI/SOL—0601, pp 89-106) **Desiccant and other cooling systems.** Collier, R.K. (Solar Energy Research Institute, Golden, CO). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

Desiccant cooling systems are those systems which process water vapor in the earth's atmosphere to produce cooling. Since mass transfer occurs between the system and its environment, they are commonly referred to as open-cycle systems. These systems all use a liquid or solid material called a desiccant to remove water vapor from the air. The physical phenomenon by which water is removed is most often absorption on the solid desiccants and absorption in the liquid desiccants. The liquid systems utilize two separate spray chambers for the processes of drying and regeneration. The strong solution (triethylene glycol or lithium chloride and water) is sprayed over cooling coils whose temperature is maintained by a cooling tower. Air to be dried passes through the spray and is dried and cooled. When the desiccant solution absorbs sufficient moisture from the air, it is pumped to another chamber where it is sprayed into an externally heated air stream. This regenerates the solution, which is used again in the drying process. These commercial systems are air driers only and do not produce a significant net cooling. In order to produce cooling, the air being processed must be dried to a greater degree than that desired for human comfort or product protection. This additional dryness is converted to sensible cooling capacity by reinjecting water into the air stream.

30388 (MRI/SOL—0601, pp 107-124) **Application of energy storage for solar cooling.** Sofrata, H. (Riyadh Univ., Saudi Arabia). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

Storage for solar cooling systems is discussed. Discussions of the various systems used for solar cooling, storage and collection are presented in such a way to facilitate the matching of these basic elements. It is concluded that energy storage is a key aspect of making a collection into a useful cooling system. The storage may be classified according to the loss time dependency. The temperature level has a major role in the characteristics and performance of the storage especially and on the different elements of the cooling system in general. A trial has been done to differentiate between the various types of storage in order to find out the most suitable cooling system components in Saudi Arabia. The findings of this trial is to use either a system composed of refrigerant storage, evacuated tube collector and a Li/Br-water dual absorption system or a battery storage, photovoltaic collector and inverse thermocouple cooling system.

30389 (MRI/SOL—0601, pp 125-167) **Applications of collectors for solar cooling.** Khoshaim, B.H. 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

A collection of information of up-to-date technology for most types of solar collectors, specifically those collectors that are in use for solar heating and cooling systems, is presented. The survey includes a comparison between existing solar collectors and their advantages, features, and efficiency. It is clear that concentrating collectors are the most suitable types of collectors for industrial purposes; nevertheless, the selection of a suitable solar collector should come after the system has been designed and the purpose specified.

30390 (MRI/SOL—0601, pp 168-187) **Simulation studies of solar cooling.** Johnson, G.R. (Colorado State Univ., Ft. Collins). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

The important features of simulation as applied to solar cooling studies are identified. First, the reasons for simulation are outlined along with the expected results available. Simulations can be used for understanding system relationships, for doing detailed design analysis or for developing simplified design aids. Overall system modeling philosophies and the organization and structure of simulation models are presented along with a discussion of common features of some typical simulation models currently in use or that have been used for simulation studies of cooling systems. The concepts of simulation model verification and validation are also discussed along with sample results found during validation phases for a simulation model. The recommendation here is that unless the requirements for a simulation study cannot be met with an existing model, the TRNSYS simulation model be used. Results for some sample simulation studies are presented. The results are from simulations using the TRNSYS model for Colorado State University Solar Houses I and II utilizing an absorption chilling unit and desiccant cooling, respectively. The studies illustrated provide design information and illustrate the types of results that can be obtained from simulation.

30391 (MRI/SOL—0601, pp 188-226) **Economics of solar cooling.** Anand, D.K.; Morehouse, J.H. (Univ. of Maryland, College Park). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

The economics of solar cooling is dependent not only upon the usual economic factors such as interest rates, capital investment, inflation, etc., but upon different competing technologies, successful commercialization, as well as the unit cost of energy. In establishing a framework for economic comparison, it is customary to use fundamental concepts of cost estimating and educated guesses as to the state of the economic and technological growth over the period under interest. The economics of solar cooling is discussed by first introducing some basic concepts, applying these to establish a framework for comparison and finally considering several generic systems.

30392 (MRI/SOL—0601, pp 227-244) **Development of solar cooling with air and liquid systems at Colorado State University.** Lof, G.O.G. 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

Several combinations of lithium bromide absorption cooling machines with solar collectors and heat storage units have been developed and evaluated at Colorado State University during the past six years. Three commercial cooling units of two to three-ton refrigeration capacity, three types of flat-plate solar collectors, and three types of evacuated tube collectors have been used in various combinations in two identical residential buildings each with square meters floor area. Detailed reports and technical papers show the performance of these systems in the supply of cooling, heating, and hot water by solar energy. Evacuated tube collectors have provided substantially more cooling than flat-plate types; water chillers have performed better than a direct expansion air cooler; and cold side storage was found unnecessary. Coefficients of performance with solar heat supply at temperatures of 75°C to 90°C were essentially the same as those obtained with fuel, but heat losses from storage tanks, if not minimized, can result in substantial reduction in net cooling delivery. A third structure, identical to the other two, is provided with an all-air solar heating system including solar air heaters and pebble-bed heat storage. The performance of this heating system has been measured and found to be essentially the same as those obtained with flat-plate liquid systems. Cooling of this building by use of the pebble-bed in a day-night heat exchange cycle has also been accomplished.

30393 (MRI/SOL—0601, pp 245-250) **Double effect absorption cooling.** Vliet, G.C. (Univ. of Texas, Austin). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

The double effect absorption cooling concept represents an alternative as a cooling method at the higher temperatures for which Rankine Cycle cooling systems are being developed. This method has been described and assessed in the literature and commercially available units are available in moderate to large tonnage. The coefficient of performance of available units exceeds one and could be designed for about 1.3; thus the cycle should be seriously considered for future solar, geothermal and waste heat cooling application.

30394 (MRI/SOL—0601, pp 251-254) **Second law analysis of a solid adsorption cycle for a solar refrigerator.** Dupont, M. (Laboratoire sur l'Energie Solaire Centre Universitaire des Antilles-Guyane, Pointe-a-Pitre, Guadeloupe, West Indies). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

The basic thermodynamic considerations are recalled in order to employ the 13X Zeolite H_2O couple for solar refrigeration. The losses due to irreversibility are analyzed in the concept of energy for a refrigerator composed with a flat plate collector containing the adsorbant and an air cooling condenser without any mobil part.

30395 (MRI/SOL—0601, pp 261-265) **Solar refrigeration activities in the Materials Research Institute.** Brown, R.B. (Universidad Nacional Autonoma de Mexico, Mexico City). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

The Solar Energy Department of the Materials Research Institute is carrying out research work on solar operated absorption refrigeration systems. A description is made of the systems analyzed and the main problems encountered in the development of the solar refrigerators.

30396 (MRI/SOL—0601, pp 266-272) **Passive cooling systems for humid climates.** Clark, G. (Trinity Univ., San Antonio, TX). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

Detailed computer simulations imply that passive cooling systems can provide acceptable temperature control without assistance in all American climates. The heat transfer processes operating in passive cooling systems are described. Thermal assumptions and simulation methodologies are noted. The simulation results are presented for residences in various American cities. A roof pond type passive cooling system can provide comfortable temperatures during all hours of a typical summer in all cities. In humid climates, air circulation during the day and ventilation during the night are required in order to achieve comfort. Mechanical dehumidification would require significant energy. Thermal uncertainties are noted and a planned thermal test facility described.

30397 (MRI/SOL—0601, pp 273-277) **Wind effects on buildings and passive cooling by ventilation.** Assassa, G. (King Faisal Univ., Saudi Arabia). 1980. NTIS, PC A13/MF A01. File Number DE84017398. (CONF-8004244—).

From 1. SOLARAS workshop on solar cooling; Dhahran, Saudi Arabia (1 Apr 1980).

In passive cooling of buildings, ventilation is one of the major factors. Natural ventilation can be created if points of different pressures exist at suitable locations. The pressure distribution on a building surface depends upon factors such as form and size of the building, location topography and environmental conditions. To predict the pressure field around a building, the Navier-Stokes equations associated with the necessary initial and boundary conditions must be solved numerically. Methods of finite differences or finite elements are suitable and can be used in this respect. Wind tunnel tests are still required to provide the necessary information to check theoretical and numerical computations against measurements; in particular, when turbulence effects are pronounced.

30398 (NP—5770191, pp 8.1-8.33) **Prospects of solar heating in energy system of the future.** Ellehauge, K.; Oestergaard Jensen, S. (Danmarks Tekniske Hoejskole, Lyngby. Lab. for Varmeisolering). Jan 1984. (In Danish). NTIS (US Sales Only), PC A16/MF A01. File Number DE85770191.

Also published as DTH-LV-R-83-38.

In Technological development and its impact on the future energy system. Appendix 1. Evaluation commissioned by the Danish Ministry of Energy.

Solar heating systems produced in Denmark represent good quality and reasonable effect. They are used as domestic water heaters and usually cover 60-70% of the total hot water demand. A typical water heating system is about 5 m^2 and total effect 750-1100 kWh/ year/m^2 collector, a typical solar water-and-space heater is about 15 m^2 and total effect 450-650 kWh/year/m^2 solar collector. Passive solar heating can be available through suitable building design, solar heat can be stored and used effectively in combination with chemical heat pumps.

30399 **(NP—5900477) Evaluation of performance for a breadbox solar water heater in Iowa.** Getter, R.D. (Iowa Energy Policy Council, Des Moines (USA). Iowa Solar Office). 19 Mar 1985. 20p. NTIS, PC A02/MF A01. File Number DE85900477.

The design and testing of a passive water heater are presented. The design selected was a breadbox type with heat-tape wrapped piping for freeze protection. Monitoring of the water heating system consisted of recording the power consumed by the heat tape and the power used from the storage tank. System performance ranged between 545 and 8090 Btu/day average output and efficiencies ranging fraom 9 to 56%. (BCS)

30400 **(NP—5900978) [Solar energy]. Review of progress, 1983.** Ashram, S.A. (Tata Energy Research Inst., Pondicherry (India). Field Research Unit). 1983. 18p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85900978.

The progress on several projects are briefly reported. Research areas consist of the following: Medium Temperature Liquid Collectors including Solar Ponds, Convective Solar Dryers for Agro-Industrial Products, Rural Energy Needs and Systems, and Retrofitting Passive Heating in SOS Childrens' Village, Leh. A list of publications generated from these research projects is also included.

30401 **(PB—85-157501/XAB) CEC (Commission of the European Communities) modelling group for solar-heating systems and domestic hot water.** II. van Galen, E.; Havinga, J. (Commission of the European Communities, Luxembourg). [1985]. 191p. (EUR—9157-EN). NTIS, PC E08/MF E08.

The objectives of the work carried out are the following: extension and improvement of the initial version of the European detailed model (EMGP) for solar systems. The initial version of this modular program was developed at the Catholic University of Leuven. The validation of the model with the aid of experimental data from the Solar Pilot Test Facilities. The use of the model for system studies. The development of a European simplified method (ESM). The validation of the European simplified method with the aid of the European detailed model.

30402 **(SERI/TP—253-2562) Results of active solar control system testing and the performance effects of sensor degradation.** Farrington, R.B. (Solar Energy Research Inst., Golden, CO (USA)). Mar 1985. Contract AC02-83CH10093. 19p. (CONF-850606—8). NTIS, PC A02/MF A01. File Number DE85002945.

From American Society of Heating, Refrigerating and Air-Conditioning Engineers' semiannual meeting; Honolulu, HI, USA (23 Jun 1985).

The Solar Energy Research Institute has been involved in testing control systems, including thermistors, switches, RTDs, integrated circuit sensors, and controllers, since 1981. The results show serious reliability problems with control systems. Sensors degraded or failed from exposure to high temperature, and controllers did not meet specifications. The effect of sensor degradation on annual performance has been quantified for a particular system configuration in four different locations; as much as 50% of the collected energy can be lost, and the auxiliary energy requirements can increase by 250%. Test results of three prototype control systems for solar space heating are also briefly discussed.

30403 **Application of transparent enclosure theory to solar energy absorption by cylindrical tubes in sunspaces.** Mc Cabe, M.E.; Van Migom, M. (Building Equipment Division, Center for Building Technology, National Bureau of Standards, Gaithersburg, MD). *Journal of Solar Energy Engineering;* **107**: No. 1, 5-9(Feb 1985).

A general matrix formulation for beam and diffuse radiative solar transfer is presented for an enclosure containing partially transparent walls. The general theory is used to study the absorption of radiatn solar energy in a building sunspace having a south-facing window and a row of opaque vertical cylindrical-tube solar absorbers. A two-dimensional model is formulated for the sunspace in which a typical cylindrical absorber tube is subdivided into a number of uniform elements and the window and sunspace surfaces are each represented as single elements. The matrix expressions are evaluated for incident solar flux conditions typical for a south vertical window on a clear winter day. The results are presented as dimensionless ratios of absorbed-to-incident solar flux as a function of the tube spacing to radius ratio. The spatial distribution of absorbed solar flux is presented at discrete time interals for the cylindrical tube. Space and time-averaged values of absorbed solar flux are also presented for the cylinder, the window, and the room. The potential application of these results for thermal modeling in passive solar applications is discussed.

30404 **Consumer retrofit responses.** McKown, C.; Felter, P.E. (Texas Tech Univ., Lubbock, TX). pp 479-482 of Progress in Passive Solar Energy System. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1985). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Energy costs continue to climb. Most consumers cannot afford to purchase a new energy efficient home; therefore, retrofit becomes an important part of energy conservation. A survey of the Unit neighborhood in Lubbock, Texas revealed that consumers are concerned about energy, were not knowledgeable of passive solar alternatives and that all would consider some form of retrofit. Most consumers indicated that a fifty percent or less reduction in energy costs would be acceptable for them to consider a retrofit. The majority of those surveyed had not visited a passive solar dwelling. This points to the need for models, open houses and ongoing educational activities.

30405 **A design procedure to size windows for naturally ventilated rooms.** Chandra, S. (Florida Solar Energy Center, Cape Canaveral, FL). pp 105-110 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A step-by-step procedure for sizing inlet and outlet window areas for naturally ventilated rooms is presented. The procedure sizes windows to obtain a desired airflow (cfm) in cross-ventilated rooms for a given wind speed and direction. It accounts for the effects of architectural projections, neighboring buildings, terrain type and insect screening. The procedure has been verified against airflow measurements in a full-scale residence.

30406 **Energy strategy selector for small office design.** Holton, J.K.; Pansky, S.H. (Burt Hill Kosar Rittelman Assoc., Washington, DC). pp 413-418 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A project has been undertaken to develop energy conservation handbooks for the first of several building types. The work is in support of the Battelle Pacific Northwest Laboratories and the U.S. Department of Energy research project on energy conservation in commercial buildings. The Handbook of Energy Strategies for Small Office Design is viewed as a catalyst that will provide sound guidance by a simple method for the design of energy efficient buildings. It is based on the best current knowledge and state-of-the-art research and demonstration work in energy conservation/passive solar. Extensive investigation on base case building character charstiis, utility rate structures and energy strategies underlie the project. Building performance modeling has been carried out with the ESE program (an ASHRAE TC 4.7 based program) with comparison runs on DOE 2.1b.

30407 **Passive solar cooling systems concepts for small office buildings.** Kantrowitz, M.; Hart, G.K.; Whiddon, W.I. (Min Kantrowitz & Assoc., Albuquerque, NM). pp 419-424 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper summarizes the efforts of a small group of building design professionals and energy analysis experts to develop passive solar cooling concepts including first cost estimates for small office buildings. Although estimated annual energy savings from passive cooling technologies range from modest (5-10% savings), the first cost of these to 40% savings), the first costs of these systems appears to be low (from 0 to 8% over comparable buildings). If these preliminary estimates are borne out in real world applications, simple paybacks from 0 to 5 or 10 years could make passive cooling an attractive energy saving design alternative.

30408 **Occupant effects and interactions in passive solar commercial buildings: Preliminary findings from the US DOE passive solar commercial buildings program.** Kantrowitz, M. (Min Kantrowitz and Assoc. Inc., Albuquerque, NM). pp 433-438 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

While some data on the substantial impact of occupancy factors on energy use in residential buildings exist, these effects in commercial buildings have not been systematically investigated. This paper presents the approach to examining the relationship between occupants and energy use currently being implemented through the U.S. Department of Energy Passive Solar Commercial Buildings Program. The buildings in this program include airports, schools, commercial retail and office space and a variety of community facilities located across the U.S., from Alaska to Alabama. Preliminary findings related to how occupant behavior influences energy use and how users respond to these passive solar commercial buildings are presented. Although data from the buildings in the program are incomplete, they do point out several important conclusions and relevant issues. Most building users seem to be satisfied with conditions in the buildings-the patterns of the relatively few complaints about comfort reveal cool, sometimes drafty mornings and warm afternoons. Some concern about acoustics has also been expressed.

30409 **The Daylight Solar Vent: Flexible design.** Aalfs, M. (Seattle, WA). pp 193-198 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper presents the Daylight Solar Vent (DSV), a concept by which daylighting, solar heating, and ventilation are provided within one flexible system. The intent is to make use of available solar energy to provide ventilation and illumination as well as space heat. Conservation and super insulated houses requiring less than 8 Btu/ft^{2}DD are, by definition, well designed for the cold season when energy efficiency may be the primary design consideration. However, daylighting and ventilation, design considerations that increase in relative importance during the warmer seasons, are all too often sacrificed in narrowly focused design. The DSV concept provides daylighting, ventilation, and solar heating with the flexibility for building occupants to modify the system as solar fluctuates and seasons change. This system is conceived with the Pacific Northwest in mind, although the concept is applicable to most climates. This system provides daylighting/direct solar heat, isolated gain solar heat, or thermal stack summer ventilation. Three primary moving parts allow the system to be converted from one mode to another. 1. A large thermal shutter controls the amount of daylighting. 2. A thermal damper at the top of the stack, when open, allows the system to ventilate as a thermal stack. 3. With the fan activated, and the damper and shutter closed, the system is an isolated gain solar heating system.

30410 **Designing and evaluating a solar subdivision.** Morse, L.F.; Goldman, S.J. (Association of Bay Area Govts., Berkeley, CA). pp 537-542 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Production homes in new residential subdivisions can be naturally heated and cooled. Subdivision design guidelines show how to lay out streets, lots, buildings and vegetation to use the sun and the wind. The guidelines, along with simple shadow analysis tools, can be used either as design criteria to lay out a site or as review criteria to assess a development plan.

30411 **Creative interior design for thermal storage walls.** Franta, G.; Hogg, S. (ENSAR Group, Lakewood, CO). pp 519-522 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The creative interior design for thermal storage walls can dramatically improve a passive building's thermal performance, aesthetic characteristics, and human comfort (thermal and luminous).

Recent examples of unique designs are documented and presented in this paper. Color, texture, natural lighting, form, performance, cost, and comfort factors of the thermal storage walls are described for the various designs.

30412 **Energy efficient community and sub-division design for Tumbler Ridge, British Columbia: Passive solar and other dimensions.** Diamond, L. (Univ. of British Columbia, Vancouver, BC). pp 525-530 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper discusses procedures which offer increased energy efficiency for the new resource community of Tumbler Ridge, B.C. This town will house the personnel associated with the mammoth Northeast B.C. Coal Project, upon which the provincial government has staked a significant portion of its economic future. Cost comparisons for road and service layout, site orientation, passive solar gain and other forms of climatic response are presented along with their implications. These lead to changes in both community layout and configuration. The study offers precedents for similar settlements across Canada as well as the United States, (Project commissioned by Canada Mortgage and Housing Corporation, with cooperation of the B.C. Ministry of Energy, Mines and Petroleum Resources and The District of Tumbler Ridge).

30413 **Effects of daylight on interior woods and wood finishes.** Guerin, D.A. (Miami Univ., Oxford, OH). pp 511-514 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A review of literature was completed in order to determine the extent of research data available on the effects of daylight on interior woods. It was found that color change and loss of moisture content were the most important contributors to visual or physical wood deterioration. Recommendations are made that will help decrease wood deterioration when exposed to daylight in passive solar interiors.

30414 **Passive solar homes: Owners react to their interior environments.** Zentner, M.A. (Virginia Polytechnic Inst. Blacksburg, VA). pp 492-496 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Perceptions of owners of the interior environment of 28 passive solar homes (PSH) in Virginia were investigated during spring 1982. Almost half reported changes in room use in their current residence as compared to a previous non-solar home. Some noted they entertained to a greater extent therefore staying at home more frequently than in the past. Thermal comfort during different weather conditions was ascertained. Most subjects found their homes to be fairly comfortable year round. Some were cooler than they preferred in winter and warmer than they desired in summer. None of the respondents described their homes as uncomfortably hot or uncomfortably cold during the four seasons. Almost all subjects were satisfied with the interiors of their dwellings and general enthusiasm was apparent. For the most part furnishings had not been purchased especially for these homes. However, those who did so selected pieces that would be less prone to sunlight degradation. Some owners had not lived in their residences long enough to give conclusive evidence regarding appearance or other changes in their artifacts.

30415 **Radon levels in metropolitan Denver homes.** Morse, J.G. (Morse Associates, Inc., Golden, CO). pp 501-504 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Radon measurements were made in 30 relatively-new electrically heated houses in the metropolitan Denver area. The sample was selected from a group of 59 in which air leakage measurements had been determined previously. The sample was not intended to be representative of the Denver area. The study had two prime objectives: to evaluate radon/radon-daughter levels in the sample tested; to determine if a correlation exists between radon-derived radioactivity and air leakage. Radon detectors (Track Etch /sup R/ Type B, bare) were placed in basements or crawl spaces, living and bedroom areas of the house sample and radon was monitored during February and March 1982, a time of normally minimum ventilation. Radon daughter standards do not exist for the Denver area. In comparison with those established elsewhere, high levels were found in a small, but not insignificant, percentage of the sample tested. An approximate inverse linear relationship was observed between radon daughter concentrations and air leakage, suggesting that the tighter the home, the greater the opportunity for increased indoor radioactivity.

30416 **The effects of color on human comfort levels, heating and cooling loads, and task performance.** Colbert, R. (Sunstone Solar Associates, Forestville, CA). pp 507-510 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Human beings have evolved from the light of the sun and will predictably respond to the constituent colors of the sun's light. Recent studies have shown that color frequencies will cause a fluctuation in the heart beat, respiration, and blood pressure. Recent studies have shown that color frequencies will affect a person's physical, emotional and psychological comfort levels. The correct color of an interior decoration has been shown to lower the heating or cooling load of a building, and to increase the speed and accuracy at which work tasks are performed. This experiment will analyze what effects the color of a room will have on the comfort levels of human beings, and the corresponding heating and cooling loads of a building's interior environment.

30417 **The human element-influences on solar design and performance.** Reichelderfer, S. (Inland Empire Solar Energy Assoc., Spokane, WA). pp 487-492 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper discusses the critical human element in the design and performance of passive solar homes. The effect of occupant lifestyle on the performance of the home is explored via the likelihood that the occupant will perform certain design dependent operations. It is found that occupants by and large perform the operations, although not always in a manner that maximizes solar performance. Adequate instructions on how to operate systems and whether or not someone is available to perform them appear to be two critical factors in determining how well the occupant performs the operation. Homeowners in this sample had very positive reactions to their homes and their expectations closely matched reality. Both of these are felt to have positive impacts on performance of operations.

30418 **The other debate of overhead glazing: Safety.** Merkle, D.J. (SunWorks, Portland, OR). pp 497-500 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper examines the recent concern about the actual risk of safety glazings, specifically tempered, laminated and wired glass in overhead applications. This debate has been prompted by several spontaneous failures of skylights in populated areas. The primary questions are: how does overhead glazing fail, what are the failure rates and what are the risks associated with those failures? A brief report of ICBO, CABO and Southern Codes shows wide divergence on this issue. Proposed changes in these codes will reflect the conclusion of this national debate. This paper reports the information which has been compiled by City, State and Regional governments, Manufacturers of Glass and Glazing Systems, Independent Test Laboratories and Professional Designers. The paper's purpose is to inform design professionals better about the potential risks involved with overhead glazing.

30419 **Passive solar energy in Arizona: Homeowners' attitudes and perceptions.** Katz, M.A. (Tempe, AZ). pp 467-470 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

As passive solar energy continues its rapid growth, increasingly diversified information is needed to assess what has been accomplished and in which direction to proceed. Included in this information must be feedback from the homeowner detailing how he is getting along with passive solar. Is he satisfied with his energy savings? Is his carpet fading because of that nice direct gain we've brought in? How did he learn about passive solar design and what postoccupancy information would be helpful? This paper discusses a mail response survey filled out by the owners and residents of 27 passive/hybrid solar homes throughout Arizona. Questions were qualitative in nature and focused on the attitudes and perceptions of the respondent regarding such issues as economics, performance, and satisfaction with their solar homes. While no "hard core" statistical methods were applied or assumed, the conclusions drawn from the compiled results should help solar professionals to gain a better understanding of user's concerns and design with these needs in mind.

30420 **An exploratory study of the relationship between owner attitudes and characteristics of earth-sheltered housing.** Gustafson, A.W.; McKown, C. (Texas Tech Univ., Lubbock, TX). pp 475-478 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

On-site interviews were conducted with 24 respondents living in earth-sheltered homes in Texas during the summer of 1982. The majority of the respondents were married, between the ages of 31 and 50 years, had children living at home, had at least some college, were employed in a professional occupation, lived in rural or open country area and had owned single family housing before buying earth-sheltered housing. Additional information is presented regarding the structure, near environment and energy use of the earth-sheltered home. Generally, owners tended to be upscale in innovations and attitudes toward alternative housing. Statistically significant relationships were found between the attitude scales, demographic variables and earth-sheltered housing variables.

30421 **Behavioral implications of living with passive solar homes.** Case, F.D. (Univ. of Tennessee, Knoxville, TN). pp 455-460 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Case studies of fourteen households in Michigan and Tennessee are examined for behavioral adjustments to operation and maintenance of passive solar and wood burning homes, as well as space/time displacement of household activities. Possible loss of privacy and increased conflict through use of an "open plan" design are investigated.

30422 **Size preferences and user reactions to direct gain and indirect gain configurations.** McLain, J.H. (Virginia Polytechnic Inst., Blacksburg, VA). pp 461-466 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A 1/12 scale model was constructed to simulate a residential group living space in order to study user preferences of window size or direct gain/indirect gain configurations. Twenty human subjects were asked their reactions to four configurations of the south walls: direct gain, indirect gain, combination, and partial height. The most preferred configuration was the combination or 44% of wall covered by window. The indirect gain received a negative response. Preferences were strongly related to a user's desire for sunlight and the need for privacy.

30423 **Some reflections on psychological comfort and its application to energy conscious design.** Heerwagen, J.H.; Heerwagen, D.R. (Univ. of Washington, Seattle, WA). pp 439-444 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A biological basis for human psychological comfort is proposed, and its evolutionary origin is hypothesized in relation to the satisfaction of basic human needs. Environments which support these needs are experienced as pleasurable, attractive, psychologically and physically comfortable and are sought out. Environments which do not meet these needs, or which demand too great a psychological or physical adjustment, are experienced as unpleasant, unattractive, uncomfortable, and often anxiety-producing or stressful. Implications for energy conscious fenestration design are discussed in terms of the impact on view, access to sunlight and daylight, and responses to major lighting sources.

30424 **The impact of occupants on the performance of passive solar commercial buildings.** Kroner, W.M. (Rensselaer Polytechnic Inst., Troy, NY). pp 445-450 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The Visitors Information Center at Rensselaer Polytechnic Institute, Troy, New York, is a passive solar commercial demonstration project funded in part by the U.S. Department of Energy. The building's energy conscious design features integrate energy conservation, passive heating, cooling, and daylighting techniques with innovative comfort technologies, multiple-path-comfort options, multifunction energy flow controls, and HVAC systems. The building has been designed to be user-friendly and provides the means for individual occupants to meet their personal comfort requirements. The building has been occupied since February 1981, and detailed measurements on the building's performance have been collected for two years. Although the occupants are very satisfied with the comfort provided by the building, the hour-by-hour simulation results on energy consumption, used during the design phase, are significantly lower than realtime measurements. The hour-by-hour simulation uses standard thermostat set-points, infiltration rates, and lighting levels in conjunction with the Albany, NY, weathertapes, yet actual energy consumption is 39% higher than predicted.

30425 **Passive solar homes: Incentives for ownership and satisfaction associated with functional characteristics.** Zentner, M.A. (Virginia Polytechnic Inst., Blackburg, VA). pp 451-454 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Twenty-eight owners of passive solar homes (PSH) in various areas in Virginia responded to a self-administered questionnaire. The data for this project were gathered during the spring of the 1981-82 academic year. Generally, owners were highly educated, fairly affluent individuals with small families. These persons were characterized as ecology minded, do-it-yourselfers. Incentives for residing in a PSH included saving expenditures on fuel, positive feelings about the design characteristics, conservation of natural resources, and the aspects of natural sunlight and warmth. Most respondents reported having little or no trouble locating well-documented information about solar adaptation to meet specific needs. An overwhelming majority of the participants were satisfied with the general interior, exterior, and overall features of their PSH. These levels of satisfaction may be due in part to the degree of involvement in home functioning that the owners reported. Subjects responded to open-end questions and shared many and varied experiences about their PSH. These are described to a greater extent in the text.

30426 **Monitored heating season performance of the Mount Airy public library building.** Frey, D.J.; Holtz, M.J.; Morgan, J.G.; Vest, J.C. (Architectural Energy Corp., Westminster, CO). pp 391-396 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Actual energy consumption by end use during the winter months for the passive solar library building in Mount Airy, North Carolina is compared to the predicted values and major differences between these two are explored and explained based on data and interpretation of performance. Key elements are occupant reaction to the building and changes in the operational strategies for the building based on feedback from the data acquisition system.

30427 **The DOE passive solar commercial buildings program: Preliminary results of performance evaluation.** Lutha, R.; Fisher, W.J.; Rockwell, P.G. (US Dept. of Energy, Argonne, IL). pp 397-400 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The U.S. Department of Energy is conducting performance evaluation of the buildings in the Passive Commercial Buildings Program. The objectives of the effort are: 1) to determine how much auxiliary energy is being saved by these passive solar buildings over non-solar buildings, and 2) to determine whether the buildings function, or are perceived to function, as well as non-solar buildings. Some preliminary results of the evaluation are that the buildings are, in fact, saving significant amounts of energy in comparison to non-solar buildings; that a majority of the occupants are satisfied overall with the buildings; that occupancy of the buildings can be substantially different than what was assumed during design; and that passive buildings require a great deal of communication between designers, vendors, and contractors for successful construction.

30428 **Monitored performance of Patoka nature center: A direct gain building with BEADWALL night insulation in southern Indiana.** Moore, F. (Miami Univ., Oxford, GB). pp 387-390 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The monitoring and analysis of the passive solar heating performance of Patoka Nature Center is described. The Center is located in southern Indiana and was designed by the author (who is also Principal Investigator for the monitoring project). The building has a floor area of 3200 square feet, is heavily bermed and well insulated. The building features 1390 net square feet of direct gain solar collector. This collector is equipped with BEADWALL /sup tm/ night insulation. Thermal storage is provided by a masonry floor and 40 water-filled fiberglass tubes. During the 1981-82 heating season, the building used 257 million Btu for space heating. This was supplied from: auxiliary heating equipment (28%), electric lighting (22%), other equipment (2%), and solar (48%). The annual solar heating efficiency (solar utilized/solar incident on collector glass) was 21.3%.

30429 **Assessment of passive features in residential buildings.** Wood, R.A.; Purcell, G.G. (JBF Scientific Corp., Wilmington, MA). pp 379-384 of Progress in Passive Solar Energy System. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The following passive solar options were assessed: selective surface mass walls, highly reflective exterior surfaces, infrared reflecting window film, and triple pane windows. The options were assessed for thermal and economic performance for Casper, Wyoming, and Fresno, California. Each of the options is described in detail. Of the three passive solar options, the infra-red reflecting window film appears to be the most economically attractive for both locations. This is followed by the triple pane windows, the selective surface for mass walls, and then by the highly reflective exterior surfaces.

30430 **The 'Mabathoana House' In Qualing: A transitional modern design in Lesotho.** Klein, G.A. (Associates in Rural Development, Inc., Maseru, Lesotho). pp 899-902 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper concerns the design, construction and performance of a thermal storage wall and direct gain house in the lowlands of Lesotho. Infrastructural self-reliance was integral to the design in that the demand for water has been minimized, and the need for grid-supplied electricity eliminated. Alternative, on-site systems provide for very comfortable living at low personal and societal costs. Coupled with the use of locally available, "modern" building materials, this house represents another step in the transition from existing practice to environmentally wise architecture.

30431 **"Water tubes? not in my living room": Homeowner attitudes towards passive solar aesthetics.** Appleyard, W.L. (Sunstructures Inc., Ann Arbor, MI). pp 483-485 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Passive solar homes often contain new and different looking products and design features. Many are viewed with skepticism and are often installed on the insistence of the designer; explaining that they are essential to the performance of the passive system. In addition to their appearance, many are expensive. The authors felt it was important to get feedback from the owners as to how they felt about these features, whether or not they were being used to their fullest, how the owners felt about their homes now that they had lived with them a while, and what they might do differently if they were to build again. In order to investigate these attitudes and to get feedback on completed designs a questionnaire was distributed to clients who had lived in their homes for at least one year. Additional information was gathered on post-occupancy interviews and site visits.

30432 **Heating season from the Bonneville Power Administration Class B passive solar monitoring program.** McKinsty, M.; Lambert, L. (Bonneville Power Administration, Portland, OR). pp 211-216 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Thermal performance monitoring results for the 1982/83 heating season from sixteen passive solar houses located in the Pacific Northwest are presented. Use is made of the SERI Class B monitoring methodology. Design effectiveness implications of the data, and comparison with design tool predictions are discussed. The houses are located in Portland, Oregon, and Spokane, Washington. They were designed under the Bonneville Power Administration's Solar Homebuilders Program.

30433 Instrumentation and data analysis for building energy monitoring. Fowlkes, C.W. (Fowlkes Engineering, Bozeman, MT). pp 217-222 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper relates the result of our efforts, spanning several years, toward the goal of making low cost and meaningful thermal measurements on buildings. Experimental pitfalls are illustrated with examples and suggestions for better experimental procedures are given. A data acquisition system using a powerful portable microcomputer in conjunction with compact data acquisition modules is discussed. This paper also discusses real time data analysis methods that may prove useful for short-term performance monitoring. Results of some data using recursive, digital filtering algorithms are presented. These algorithms when programmed on the computer (which can sense and respond in real-time in the physical world using the data I/O modules) form a system with an order of artificial intelligence. The goal of this intelligent system is to form an Energy Signature for the building. The Energy Signature consists of several equivalent thermal parameters of the building which form an energy signature characterizing the building.

30434 From vernacular to daylighting architecture historical aspects. Gerber, M. (CLEA, Les Perdrigals). pp 881-885 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Work started in 1976 with the rehabilitation of an ancient building in mediterranean climate. At that time, the main concern was to integrate the passive solar architecture in the socio-cultural context, e.g., Les Perdrigals. Another aspect of the work is designing greenhouses for new buildings or retrofits. In a mountain climate, a two story greenhouse will be presented. The use of sun as natural lighting and energy source is demonstrated in a partly underground single family dwelling. First example of a low cost housing program is described. This project for the new Prefecture in Montpellier focused on extensive utilization of daylighting systems. The approach of this project is presented.

30435 Measured performance of 50 passive solar residences in the US. Swisher, J.N.; Duffy, J.J. (Solar Energy Research Inst. Golden, CO). pp 223-227 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper summarizes the thermal performance of 50 passive solar residences in a variety of U.S. locations. These buildings were monitored as part of the Solar Energy Research Institute (SERI) Residential Class B Passive Solar Performance Monitoring Program. The paper describes the monitoring and performance evaluation methods and presents the overall heating season performance of the buildings in graphical form. We draw some general conclusions from these results and discuss the validity of extrapolating such conclusions to passive solar buildings overall.

30436 The Massachusetts multi-family passive solar program: A comparison of monitoring data to design tool predictions. Lofchie, H.; Duffy, J.; Noble, E. (Massachusetts Executive Office of Energy Resources, Boston, MA). pp 229-234 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The Massachusetts Executive Office of Energy Resources, (EOER) through its Multi-Family Passive Solar Program, (MFPS) has provided design and technical assistance, and funded construction, for solar heating and conservation measures affecting more than 750 apartments at 30 different sites in the Commonwealth. Four sites from the program are monitored as part of the Solar Energy Research Institute (SERI) Level B Program. This paper describes the simulation and monitoring design for one of the apartments in Braintree, Massachusetts, presents performance data collected during the 1982-83 heating season in graphic and tabular form, compares measurements to predictions, and describes analysis of the data to calibrate computer simulation models used for design.

30437 Performance of passive solar and energy conserving houses in California--Class B monitoring. Mahajan, S.; Newcomb, C.; Shea, M. (California State Univ., Sacramento, CA). pp 235-240 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; America Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Nine passive solar and two conservation houses in various California climates were monitored for a period of one year starting in July 1981. The two conservation houses were located next to passive solar houses for convenient comparison of performance. The Solar Energy Research Institute (SERI) Class B data collection methodology and instrumentation, modified to meet California needs, were used. This included continuous data collection with data stored hourly on cassette tape and processed daily, weekly and monthly on paper tape. In addition to the continuous data, one time measurements were made on each house to determine the building loss coefficient, infiltration rates and furnace efficiency. The hourly data on cassette tape were transferred to disc and then used to analyze the thermal performance of each house. The solar contributions were obtained subtractively and comfort levels maintained are indicated by monthly plots of extreme, and binned inside and outside temperatures. The overall performance for each house is presented and compared to an equivalent non-solar house. In the two cases where solar and conservation houses are nearby, these performances are also compared.

30438 Development of an inexpensive passive solar simulation technique using small-scale models. Lee, K.S. (Ohio State Univ. Columbus, OH). pp 123-128 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

In order to investigate the thermal simulation of a full-sized passive solar building using scale models, a simplified large test unit (6'x6'x7' inside dimensions) was used as a base line in testing the adequacy of the scaling factors, and several test units of half and quarter-scale were used. Various types of passive solar systems – including direct gain, water wall, thermosiphon air collector systems, moveable insulation and multi-zone were used.

30439 Conservation and solar guidelines. Balcomb, J.D. (Los Alamos National Lab., Los Alamos, NM). pp 117-122 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Guidelines are given for selecting R-values and infiltration levels and determining the size of the solar collection area for passive solar buildings. The guidelines are based on balancing the incremental cost/benefit of conservation and passive solar strategies. Tables are given for 90 cities in the US and the results are also displayed on maps. An example is included.

30440 Relative contributions of beam, sky, and ground components to diffusely reflected sunlight illuminance in physical models. O'Loughlin, P.; Porter, R. (Inst. of Environmental Studies, Miami Univ., Oxford, OH). pp 143-146 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

By correctly positioning and tilting a physical model, solar altitudes and azimuths can be simulated. This provides a quantitative tool for measuring the interior illumination performance of a building design which uses diffusely reflected sunlight as it's primary illumination strategy. The tilting of the model, however, exposes the glazing to artificial sky and ground components of different luminances. Since the beam radiation contribution (80.7%) dominates the interior illuminance, only a relatively small and insignificant error is introduced. The tilted physical model is a valid simulation tool for predicting interior illuminance from diffusely reflected sunlight under clear sky conditions.

30441 **California's Point System - expansion and improvement.** Huston, B.; Chisti, I.; Mallette, E.E.; Miller, K.A. pp 573-576 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The California Energy Commission's Point System is a simplified method to analyze the energy performance of residential buildings. Although the system is an accurate predictor of energy use, several modifications would increase its accuracy and application. This paper presents three such changes and provides examples of resulting point tables for each change.

30442 **Overview of the results of the Residential Conservation Demonstration Program.** Campbell, J.A. (Growing Concepts Inc., Tallahassee, FL). pp 577-581 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The results of the Residential Conservation Demonstration Program are presented. Over portions of the last two years, 170 homes in Florida have been monitored for electrical energy consumption of various energy conservation devices including passive solar design strategies, radiant heat barriers, and ventilation strategies; solar water heaters, dedicated heat pumps, heat recovery units, and high efficiency air conditioners, heat pumps, ceiling fans, and insulation; and high efficiency refrigerators. The measurements of the performance of these devices were conducted under a range of climate conditions in Florida characterized as hot and humid with sample sizes ranging from 1 to 25. Energy savings, peak demand savings, and cost effectiveness data are presented where available.

30443 **Assessing solar and conservation retrofits in home rehabilitation programs for low and moderate income people.** Conklin, C.L. (City Hall, Ann Arbor, MI). pp 589-594 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A two year study was conducted by the Ann Arbor Energy Office where five solar/conservation demonstrations were conducted on the homes of low income clients in the city's Community Development Department's Home Rehabilitation Program. This paper summarizes the results of that study.

30444 **The California Triangle.** Steinberg, C. (California Dept. of Housing and Community Development, Inglewood, CA). pp 605-606 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Public Housing in California faces new choices in achieving energy efficiency. Should housing agencies fund/develop units which are superinsulated and the easiest for construction trades, but are not passive or active designs? Or, will Public Housing agencies take a leadership role and create an atmosphere for architects, developers and builders to grasp the sittuation and produce innovative energy efficient housing?

30445 **Energy education for a major builder.** Andrews, S.; Baccei, B. (Solar Spectra, Denver, CO). pp 609-614 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper presents a summary of an energy conservation and passive solar training program provided during 1982 for one of the largest homebuilders in the Denver area. The interaction between the energy design consultants and the builder staff--both past and ongoing--is described. Cost and predicted performance information for several home designs are summarized. The limited developments achieved through the program to date are reported.

30446 **Common errors in design and construction of passive solar homes: Results of a review of NMSEI technical assistance program.** Selinfreund, M.; Farrer, R. (New Mexico Solar Energy Inst., Las Cruces, NM). pp 615-617 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

One of the state-funded programs of the New Mexico Solar Energy Institute (NMSEI) at New Mexico State University provides citizens of New Mexico with a limited amount of free technical advice on the design, construction, and operation of solar systems. Requests for assistance are now averaging 40 to 50 per month in the solar thermal field alone. Increased efforts to inform the public (especially home builders) through passive solar workshops and through the news media have increased the number of requests concerning the design and construction of solar homes. Most requests for technical assistance fall into this category. Experience in the technical assistance program has identified common areas in which help is needed and identified common errors made in the design and construction of solar homes. Many of the potential owners and/or builders who contact the institute can be divided into two major categories. The first category consists of those that have little or no knowledge of solar essentials but want to build a solar home. They believe that this solar home must be mechanically equipped with collectors, isolated storage systems, and various fluid handling components. The other category is conversant with solar essentials and elects (for personal, aesthetic, or economic reasons) to build a frame house. People in this group often assume incorrectly that they cannot incorporate an adequate amount of thermal mass for heat storage in a frame house.

30447 **New Mexico Solar Energy Institute workshop survey.** Miller, D.; Chilton, S.; Morrison, J. (New Mexico Solar Energy Inst., New Mexico State Univ., Las Cruces, NM). pp 619-622 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

During the summer and fall of 1982 the New Mexico Solar Energy Institute conducted an extensive survey and analysis of its information and education activities, primarily the solar workshop program. This paper presents an evaluation of the workshop survey methodology, the survey findings, and an assessment of program directions based upon these findings.

30448 **Passive Solar Design guidelines and evaluation criteria for builders.** Balcomb, S.; Conkling, M.; Pyde, S.; Vigil, L. (Passive Solar Associates, Santa Fe, NM). pp 623-627 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper describes the New Mexico Showcase of Solar homes, a 1983 project featuring two model solar villages. Key features of the project are emphasized including the private sector character and marketplace considerations. To assure integrity and quality in solar design, the Showcase Advisory Board set guidelines using a balance of conservation and passive solar and addressing the issue of occupant comfort. The guidelines, based on research and methodology developed at the Los Alamos National Laboratory (LANL), were then used to establish criteria and worksheets for builders seeking entry into the Showcase project. Designs accepted for the Showcase met the criteria and have become examples of the transfer of research to practice. Another significant aspect of the project is that it makes accessible very usable and reliable design information to builders, real estate lenders, mortgage lenders, and homebuyers. The worksheets bring the laboratory into the marketplace.

30449 **Test boxes for comparative and competitive experiments teaching passive solar design.** Moore, F. (Miami Univ., Oxford, OH). pp 629-631 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Two types of experimental projects were assigned to the author's passive solar course for Miami University students. Students constructed identical foam test boxes. These were used in teams to experimentally compare the performance of various assigned passive solar configurations. Each student, using data monitored collaboratively by the team, independently analyzed the results and presented conclusions. In a separate project, each student designed and constructed a liquid solar collector (active or passive). These were competitively tested and the results presented by each student in a technical paper.

30450 **Solar Architecture in Schools: An innovative community approach.** Leslie, R.P. (Rensselaer Polytechnic Inst., Troy, NY). pp 633-636 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

An Architect-in-Schools program has completed its second year with a unique emphasis on solar architecture under joint funding from the New York Foundation for the Arts and the Schalmont Central School District. The program supported 84 sessions of an architect in residence. Hands on experimentation with solar design parameters culminated with the actual construction of solar greenhouse additions to two schools. These greenhouses were designed by students in grades 4 and 5 and were constructed as workshops involving the entire community. The program not only provided solar architecture as a synthesizing academic exercise for the school children, but also provided community consulting time and lectures on energy conscious design. The establishment of an annual Energy Fair further involved the community.

30451 **Curriculum for the Los Alamos method.** Arenson, M.; Stayton, R. (Sunscope Resources, Santa Cruz, CA). pp 637-639 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A curriculum for teaching the Los Alamos passive solar analysis method has been developed. The Los Alamos method is a quick and fairly accurate tool for estimating the peromance of a wide variety of passive solar configurations. However, the method as presented in Volumes 2 and 3 of the Passive Solar Design Handbook is not easily accessible to many people. The authors have developed a curriculum for a community college course in solar home design that presents the Los Alamos method in a coherent fashion. The curriculum has been tested and improved over three semesters. The performance of the students proves that the Los Alamos method can be taught to both professionals and novices with limited math background if the presentation is greatly clarified. This paper describes the curriculum and the steps taken to develop it.

30452 **Your solar house thirty-five years later.** Katz, J.S. (MIT, Cambridge, MA). pp 641-646 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The following study re-examines a 1947 book of passive solar house designs, the results of a project sponsored by a leading U.S. glass company. From interviews with people involved in solar research and energy-conscious design and using computer studies, an analysis of the reasons for the rise and fall of post-war solar design was conducted. It was found that net energy gained from solar proved to be a less significant influence on later developments than the aesthetic qualities for which these houses were also designed.

30453 **A gas-fired heat pipe zone heater for passive solar buildings.** Winn, C.B.; DeWinter, F.; Kirkpatrick, A. (Colorado State Univ., Fort Collins, CO). pp 655-660 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A heat pipe zone heater for backup heating in passive solar buildings is described. The gas-fired zone heater has lower operating costs than alternative zone heaters. It also has the boiler outside the building envelope and the condenser inside so that combustion products are not generated inside the conditioned space. Energy conserving features of the zone heater include a low thermal capacitance boiler, low flue gas temperature due to the self-regulating effects of the heat pipe, the use of outside combustion air, and elimination of vent penetrations of the heated envelope (only a small diameter, easily sealed transport section of the heat pipe will penetrate the envelope). The use of the zone heater with a passive heating system results in reducing life cycle costs for heating and also affects the Conservation Factor for the various passive system types and locations. The conservation factor gives the optimal combination of energy conservation and passive solar design for a building. The conservation factor is modified in this paper to account for the use of a zone heater in a given zone in an energy conserving passive solar building. Analytic solutions to constrained and global optimizaton problems are also presented.

30454 **Overhead glazing and thermal comfort control.** Hoffman, H.H. (Wm. John Poss & Associates, Aspen, CO). pp 661-664 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Thermal comfort is uniquely controlled in this well-oriented and insulated mountain home with extensive overhead glazing. The fully automatic system reduces window heat loss and gain by multiple layers of flame-retardent fabric that rolls up into a compact tube assembly. In addition, a vinylcoated fiberglass screen assembly on a separate track provides sun control while maintaining views to the exterior. The overall sloping to vertical system provides for both effective energy control and a pleasing interior environment.

30455 **A passive solar water pump.** Bell, G.C. (Sun King Enterprises Inc., Albuquerque, NM). pp 665-668 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

In the early 1970s a novel pumping apparatus was researched in England that incorporated a liquid piston in a Sterling Cycle heat engine. However, due to the arrangement of the actual pumping mechanism the heat requirements, i.e., the flux density and quality of heat, were only satisfied by an electrical resistance heat source. Even with this restriction, the pump showed great promise for wide application since it was easily constructed. In the latter 1970s the machine came to my attention. Through extensive research and development, a novel pumping mechanism has been constructed that profoundly affects the entire function of the original pumping apparatus. The new machine operated with only one moving part. The major advantage of this latest design is the requirement for low grade thermal input, easily converted from a solar collection system. An input of 250 watts at 60° C (143° F) can now pump one gallon of water in two minutes through a lift head of 2 meters (6.5 ft).

30456 **Retrofit TAP's for thirteen Pennsylvania schools.** Garrett, D.C.; Anderson, A.K.; Summers, L.H. (Comprehensive Design Assoc. Inc., State College, PA). pp 669-672 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Relatively inexpensive, however commercial quality, retrofits were made to a variety of Pennsylvania schools varying from elementary schools, to high schools, to university facilities. The south, southeast, and southwest facades of each building were treated with a commercial insulated panel system that was designed as a Thermocirculating Air Panel (TAP). The TAP-FLOW computer program was used to estimate the appropriate vents, and collector proportions. A computerized analysis based on Balcomb's Solar Load Ratio was used in order to determine the effectiveness of the TAP. This paper reports on the diverse problems encountered during the design and execution stages of the retrofits. Because of client requirements, each application used different construction and management styles. A variety of reverse circulation damper stops were used with varying degrees of acceptance and success. At the request of the client, certain TAPs were outfitted with internal shading devices that would control the gain. The TAPs have had great acceptance by the users and are presently being used as examples of solar energy heating by the diverse educational institutions. This paper concentrates on the constructional and client acceptance aspects of the large scale TAP installation (over 12,000 square feet of TAPs to date).

30457 **Assessment of the benefits and implications of retrofit options for existing windows in the UK.** Ruyssevelt, P.; Clegg, P. (Polytechnic of Central London, London). pp 673-678 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The various options available for retrofitting windows are described and their performance simulated in a domestic situation using the thermal simulation model SUNCODE. Predicted energy savings are presented for each treatment and certain combinations of treatments. The performance of each treatment in terms of solar gain versus heat loss, ability to reduce air infiltration and other characteristics is illustrated. Conclusions are drawn as to the most appropriate applications for the various window treatments.

30458 **Wood frame supported thermal mass floors.** Kelly, E.J. (Sun Structures Inc., Ann Arbor, MI). pp 685-687 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The direct gain passive solar concept employing a mass floor is quite common and easily constructed in slab-on-grade residences. Often, however, certain design decisions or constraints may require an above grade solution to thermal mass floors for optimum solar performance. Above grade, wood frame supported, thermal mass floors, which can be low-cost, low maintenance, and attractive, have been developed in two residences designed and constructed by SUNSTRUCTURES. The finished result is a mass floor with a dark color added to the concrete with a tile pattern of oak strips set in the floor in one house and a dark slate tile finish in the other. Both of these floors will have good passive thermal storage and sound control characteristics. They are relatively simple to build and are amazingly effective when the need arises to utilize them in the upper story of wood framed residences.

30459 **Vapor control in site-build glazing systems.** Phelps, W.E. (Energy Research & Design Assoc., Jackson, WY). pp 689-692 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Site-built multiple glazing systems as an alternative to movable insulation offer a cost-effective method for enhancing energy performance in cold climates. Combining various glazing materials and especially high transparency films allows increased R-values without unacceptable losses in net energy gain. This approach is very attractive for horticultural greenhouses where movable insulation is not only expensive but difficult to implement over large areas and on overhead surfaces. One obstruction to the development of techniques in this area is the control of vapor migration into the glazing space. This paper discusses the results of an experimental test room constructed to evaluate the performance of five possible solutions to this problem. The approaches tested include the use of wicks, desiccant vent holes, a combination of sealed insulating unit with a storm glazing added, and a control.

30460 **HVAC control in passive/hybrid buildings with remote thermal storage.** Lindsey, L.L.; De Camp, R.L. (Princeton Energy Group, Princeton, NJ). pp 699-704 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The interaction of "solar" and "auxiliary" resources in passive/hybrid solar commercial buildings calls for special care in the design and selection of mechanical systems controls. The author reports difficulties experienced with HVAC controls for an otherwise highly successful project, and offers observations which may help other designers avoid such problems.

30461 **An integrated approach to building design.** Vasant, V.; Thomas, J. (Coromandel Engineering Co., Madras). pp 721-725 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A five story building is to be built in the coastal city of Madras (latitude 13°N) which averages 32°C touching 42°C during summer. To tackle this high temperature and moisture load, several passive features are incorporated and a liquid desiccant open cycle is used to comfort condition the building. Experimental data for a one ton system are presented in this paper.

30462 **Evaluation of a solar thermal and daylighting system.** Meckler, M.; Halldane, J.F. (California Solar Technology, Encino, CA). pp 817-822 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A solar energy system that incorporates solar space and domestic hot water heating with daylighting advantages was constructed by California Solar Technology (CST). The advantages of reduced space and domestic hot water heating loads, coupled with lower interior lighting loads, resulted in culmulative energy savings of more than 45 percent for a single-family residence in the San Fernando Valley, according to tests conducted over a two-year period. More rigorous and detailed photometric analyses are currently being completed on the CST-designed Litetherm System to verify initial results. Information from the photometric tests is dictating parameters for computer simulation programs that are being completed in the following three areas: optical simulation of the Litetherm System, thermal simulation of the system and optical simulation of the CST 1001 Litetherm Collector. This paper outlines the procedures and calculations used to obtain testing thermal performance data under actual operating conditions for the residential Litetherm System. Also described here is the luminance method of photometry developed for deriving field data. Brief descriptions of the computer simulations described above are given at the end of the report.

30463 Raising the "OPEN U" value by passive means. Baer, S. (Zomeworks Corp., Albuquerque, NM). pp 839-842 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

In hot climates where it is cool at night, buildings can be kept comfortable during hot days by storing cool in the building structure. This is a common technique used throughout the world. This paper describes how to analyze this method.

30464 The courtyard: Passive cooling performance and shading variables. Reynolds, J.S.; Blassel, J.F.; Papers, G. (Univ. of Oregon, Eurgene, OR). pp 843-848 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This study was begun in winter 1981-1982, in which season Colima's temperature and relative humidity daily range matches the hottest summer conditions of the United States Pacific Northwest. Colima's street grid is oriented about 40° west of south. "East" and "South" faces are heavily sun-stressed in winter; "West" and "North" get the strongest summer sun. From an initial casual observation of about 450 courtyards, a matrix was prepared for categorizing. About 80 were selected for a closer look, of which 31 were photographed and measured for plan. A range of residentialcommercial-institutional buildings, economic status of occupants, and courtyard usages was included. Six of the courtyards were then monitored for two days in December. Daylight, air temperature, surface temperature, relative humidity (RH) and mean radiant temperature (MRT) were recorded both in the courtyards and the street outside. Then the building containing the most cool of these six courtyards was monitored on a hot January day, to compare upper floor-lower floor and interior roomcourtyard-street conditions. Part One Conclusions: While the deeper courtyards stayed cool as expected, the more common shallow courtyards seemed much cooler than the measurements indicated, compared to the street.

30465 Total energy considerations for passive solar strategies in desert climates passive solar. Ahmed, S.F.; Jones, N.S.; Oster, J.R.; Sain, A.M. (Burt Hill Kosar Rittelman Assoc., Butler, PA). pp 849-854 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The use of passive solar features for family housing at an Army Base in the Mojave Desert, California, has been studied. The passive solar features studied are such which reduce the overall energy requirements for the house both in heating and cooling. Design curves are provided which could be used to estimate the energy savings for heating and cooling for various passive solar strategies and for different size of houses in the area.

30466 Wingwalls to improve natural ventilation: full-scale results and design strategies. Chandra, S.; Fairey, P.; Houston, M.; Kerestecioglu, A.A. (Florida Solar Energy Center, Cape Canaveral, FL). pp 855-860 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Natural ventilation can be used to cool buildings during many months of the overheated season. A significant design problem arises in ventilating rooms which have only one external wall and, therefore, cannot be normally cross ventilated. Architectural projections called "wingwalls" can be used effectively to ventilate these rooms. This paper confirms the benefit of wingwalls from airflow measurements in a full-scale room with and without wingwalls. Alternative design strategies for incorporating wingwall features in residences are also described.

30467 An environmentally responsive residence for south Louisiana. Cazayoux, E.J. (Univ. of Southwestern Louisiana, Lafayette, LA). pp 873-878 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

With a grant from the Louisiana Department of Natural Resources, Assistant Professor Hector Lasala and I researched how to build in south Louisiana to provide maximum comfort with minimum energy use for people with low to middle income FHA type housing. The product of the study was the design of a four foot modular proto-type house built with the help of architecture students from the University of Southwestern Louisiana.

30468 Senior citizen housing project at Roosevelt, NJ. Lee, S.J.; Holland, E.; Kelbaugh, B. (Kelbaugh & Lee Architects, Princeton, NJ). pp 1029-1034 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The 21 units of Section 8 Farmer's Home senior citizen townhouses is Kelbaugh & Lee's first multi-family housing design to have been built and one of the first examples of low-rise, high density passive solar housing in the Northeast. It was designed in 19801981 and construction completed in summer 1983. Each unit in the project includes: (1) a small attached greenhouse with massive floor and back wall, (2) a small stagnant Trombe wall with selective surface and direct gain clerestory in each of its one or two bedrooms, (3) a small array of five Big-Fin preheaters in each greenhouse, (4) movable insulation on all but the clerestory windows, (5) a 16SF skylight in the living room for daylighting and direct gain and (6) a solar and wind assisted ventilation chimney for natural ventilation in summer. The central community building incorporates an attached greenhouse with an array of 20 Big-Fins for preheating hot water for its washing machines, dishwasher and lavatories. The solar chimney is designed to obviate the need for air conditioning.

30469 Performance of three air envelope residences in Iowa using mass floor storage. Hadley, R.D. (CHANGE, Solar & Environmental Design, Cedar Rapids, IA). pp 1035-1040 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Since the introduction of "air envelope" structures as a concept in energy conscious design, a continual controversy has evolved questioning nearly every aspect of their construction and performance. This author agrees with the general concept of air envelope structures, but very much disagrees with the concepts of using earth as a storage media, using concrete culverts as a means of natural cooling, using double vapor barriors in the envelope walls. This paper describes the performance of three homes that differ markedly from those that have gained more notoriety, without the problems of moisture condensation, or large temperature swings.

30470 Passive solar performance of a large mixed building complex ST. Enoch Square, Glasgow, Scotland. Maybaum, M.W. (Consentini Associates, New York, NY). pp 1041-1046 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The objective of this study is to assess the environmental behavior of the St. Enoch Square Development. The architectural concept comprises a glass envelope enclosing a variety of structures, with the objective of attempting to maximize the passive use of the natural environment in order to reduce the demand for auxiliary energy and consumption of fossil fuels. The study consists of a calculation of temperature and humidity for representative spaces within the envelope exposed to both "typical" conditions (95% of the time), and to "design" or extreme conditions (2-5% of the time). From this, requirements for natural or mechanical ventilation, auxiliary heating and cooling have been determined for each typical space, together with requirements for solar control or shading. On this basis annual energy consumption and operating costs have been established for various different approaches to the relationship between the internal structures and the envelope, and have been compared to the likely consumption of a "conventional" building with the same internal contents. Daylighting studies and physical model testing has been carried out on several proposed arrangements for fenestration in the offices to provide an empirical base for daylighting performance estimates and benefits.

30471 **An experimental passive solar performance assessment on an earth-sheltered house.** Goldberg, L.F. (Univ. of Minnesota, St. Paul, MN). pp 801-814 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A simple mathematical model describing the performance of energy efficient housing is delineated. The experimental energy performance data obtained from a passive solar, earth-sheltered house over a monitoring period in excess of one year is used to investigate the applicability of the model. The water heater energy consumption unavailable for space heating and the data integration period are parametrically varied to determine their effect on the model applicability. Linear regression analyses performed on the data yield an index which is a candidate for a generally applicable energy efficient housing performance label. The passive solar performance of the house is discussed in terms of the effectiveness of the concrete floor slab as a thermal storage medium and the contribution made by the solar input to the overall space heating requirements. It is concluded that the relationship between the variables encompassed by the mathematical model is not linear over their entire range, although the model is experimentally validated in terms of limit checks. Passive solar technology does make a significant contribution to the energy performance of the house supplying as much as 45% on average of the overall space heating requirements during the winter months.

30472 **Automated generation of shape factors for Mean Radiant Temperature measurement.** Moszienski, J.R.; Formwalt, W.A.; Ling, M.D.F.; Steinmann, M.; Summers, L.H.; White, J. (Pennsylvania State Univ., University Park, PA). pp 31-36 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Thermal radiation is a significant factor affecting thermal comfort in many types of artificial environments, such as passive solar architecture and radiant panel systems in buildings. Mean Radiant Temperature (MRT) is a measurement of this thermal radiant exchange. The term Operative Temperature (OT) combines the effects of both MRT and air temperature to reflect better the human perception of thermal comfort within an environment. This paper discusses the theory and computer program that calculates the MRT of a person standing anywhere within a rectilinear enclosure for a particular period of time. The use of this program can help the designer achieve optimum thermal comfort conditions and reduce initial and operating costs of heating equipment.

30473 **Interactive computers in the energy-conscious design process.** Novitski, B.J. (Univ. of Oregon, Eugene, OR). pp 25-30 of Progress in Passive Solar Energy Systems. Hates, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper describes a microcomputer program that analyzes microclimates around buildings. User input is via a graphics tablet; analysis is computed by the Brown/Novitski method of climate analysis with SOLMET data (1) from the National Oceanic and Atmospheric Administration (NOAA). The program evaluates the microclimates around a user-defined building in terms of the number of hours in the year that various areas are thermally comfortable as a result of the way the sun and wind behave around the building.

30474 **Analysis of validation data sets in the Class A Performance Evaluation Program.** Hunn, B.D. (Los Alamos National Laboratory, Los Alamos, NM). pp 9-14 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The primary objective of the DOE Passive Solar Class A Performance Evaluation Program is to collect, analyze, and archive detailed test data for the rigorous validation of analysis/design tools used for passive solar research and design. This paper presents results of the analysis and qualification of several one- and two-week data sets taken at three Class A test sites for the purpose of validating envelope and thermal-storageenergy-transfer processes in passive solar analysis/design tools. Analysis of the data sets consists of editing the measured data and comparing these data with simulated performance results using public-domain, passive solar analysis tools and a standard reporting format developed for the Class A program. Comparisons of the measured data with results using the DOE-2 computer program are presented.

30475 **Results from the Pala Passive Solar Project.** Clinton, J.R. (Solar Energy Analysis Lab., San Diego, CA). pp 15-24 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The Pala Passive Solar Project consists of a set of eight test buildings devoted to side-by-side testing of passive concepts. Each of seven of the buildings tests a major passive solar feature with the eighth building of conventional design. The two room test buildings are fully instrumented and have been in continuous operation since early 1981. Some of the buildings' special features and construction details are presented. Conclusions drawn from the project during both winter and summer are discussed along with some examples of typical data from the project.

30476 **A generalized model for passive solar direct gain.** Givoni, B. (Ben Gurion Univ.). pp 21-25 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The correlation model for direct gain developed by the Los Alamos Scientific Laboratory group on Passive Solar Systems, was generalized. While maintaining the general form of the predictive equations the new model, the "Predictive Model for Direct Gain" (PMDG) replaces the original Constants, applicable to the different "reference" cases, by functions depending on the thermal properties of the building and/or the components of the solar system. By this transformation the LASL model for direct gain becomes a generalized one. The new model predict the performance of buildings heated by direct gain with any heat capacity, glazing and night insulation as functions of their thermo-physical properties and the climatic conditions.

30477 **Extension of the un-utilizability method for multiple-aperture passive systems.** Pratt, R.G. (Pratt & Johnson Associates, Taos, NM). pp 39-44 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The utilizability concept has been successfully applied to performance prediction for passive solar buildings. The method has the advantage of including many design variables in the calculations explicitly, rather than as location-dependent correction factors. The utilizability correlations as originally developed apply only to south-facing collector surfaces. By calculating utilizability from an instantaneous solar model which integrates incident radiation in short time intervals, a first order approximation of an equivalent utilizability for surfaces not facing true south is calculated. Where multiple passive solar apertures contribute to solar gains, the sum of the instantaneous solar gains from the apertures is used to define utilizability for the combination. Thus the method, while requiring an instantaneous solar model, allows for the possibly beneficial or detrimental effects of the relative timing of gains from various window configurations. An example calculation is given for a building with south and southeast-facing windows is given to illustrate the methodology and indicate its usefulness.

30478 A new passive solar space heating system design method for the United States. Cowing, T.; Kreider, J.F. (Univ. of Colorado, Boulder, CO). pp 45-50 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper presents a new method for predicting the annual auxiliary space heating requirements of passively heated solar houses in the United States. It features closed-form, analytical expressions for solar system performance that are amenable to use by architects, engineers, or homebuilders with the aid of an inexpensive, programmable calculator. The method is applicable to direct gain, water storage wall, or mass storage (Trombe) wall passive solar heating systems and is general in practice in that it does not restrict the user to a particular "reference" system. It permits the rapid assessment of the performance effects of variations in such system features as south glazing, thermal storage, or movable insulation. Furthermore, the auxiliary energy estimates of the thermal performance model upon which the method is premised have been compared with measured auxiliary energy usage data from owner-occupied, passively heated solar houses. Substantial agreement exists between predicted and measured results for a number of houses over a series of months within the 1981-82 space heating season. While this in no sense constitutes a complete validation of the thermal performance model, it does demonstrate its viability when applied to actual passively heated solar houses.

30479 Annual thermal utility of internal gains. Palmiter, L. (Ecotope, Inc. Seattle, WA). pp 51-56 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

30480 Passive solar design analysis utilizing electronic spreadsheets. Miles, C.R. (Oxnard, CA). pp 57-60 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper presents a method of analyzing passive solar designs using an electronic spreadsheet program such as Visicalc /sup TM/ or Supercalc /sup TM/. A simplified solar load ratio method developed at Los Alamos National Laboratory has been implemented on a spreadsheet program. This method offers several advantages over manual or specialized computer programs: 1. Parametric analysis of conservation and passive solar options is easily implemented because the worksheet is automatically recalculated each time a value is changed. 2. The user does not have to purchase or learn how to use a specialized program; the spreadsheet program that the user has can be used. 3. This method is not dependent upon a specific operating system or type of hardware.

30481 Micropas, an annual hourly heating and cooling building simulation for microcomputers. Nittler, K.B.; Novotny, R.E. (ENERCOMP, Davis, CA). pp 77-82 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper discusses the development, capabilities, and use of a new building design tool named MICROPAS. MICROPAS, initially developed under contract with the State of California Office of Appropiate Technology to document compliance with the new residential building energy standards in California, brings sophisticated annual hourby-hour heating and cooling simulation analysis capabilities for passive solar and conventional buildings to microcomputers. By simulating a reduced number of hours per year and taking advantage of the dedicated use of microcomputers, MICROPAS maintains reasonable computer run-times and accuracy while incorporating the ease of use typical of today's microcomputer software.

30482 Producing solar savings calculations using a CP/M-based electronics spread sheet. McQueen, L.V.; Martin, D.E. (Washburn Univ. of Topeka, Topeka, KS). pp 61-64 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Proper design of a passively heated (or cooled) structure is a complex thermodynamic problem, involving many variables. Well-documented work by Balcomb, et al, provides the solar community with the solar load ratio (SLR) method for quickly analyzing different options. However, many hand calculations are needed to produce detailed month-by-month results. This paper will discuss a method of producing estimates and graphs of monthly solar savings fractions using a CP/M-based electronic spreadsheet program, and will show how to integrate either program input or output with a word processor or data base program. This work is based on Passive Solar Design Handbook, Volume 2. This approach replaces tedious with rapid calculations, and should enhance communication between solar designers and their clients. The computer "template" created will be provided to ASES for distribution.

30483 A method to adjust heating and cooling load calculations for different altitudes. Ondris, M. (Front Range Solar Group, Bailey, CO). pp 37-39 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper describes a method to adjust the Degree Day factor for a specific site that differs in altitude from the reporting station.

30484 Comparison of vertical high performance glazing to sloped double glazing with movable insulation. Spears, J.W. (Vitro Laboratories, Silver Spring, MD). pp 253-258 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper compares the monitored performance of a passive solar home in Cincinnati, Ohio, before and after modification of the sunspace glazing system. The National Solar Data Network (NSDN) monitored Solargreen I from March 1980 through August 1981. During this period the sunspace consisted of 300 ft^2 of double glass at a 60° tilt with "Window Quilt" movable insulation. The NSDN resumed monitoring of Solargreen I after the sunspace was rebuilt in the fall of 1982 with 300 ft^2 of vertical, commercially available, quad-pane glazing and no movable insulation. The glazing system consists of two layers of 3M Sungain high transmission film suspended between two layers of glass. The glazing system has a manufacturer's specified U value of 0.26 and a transmittance of

0.63. The building, to which the sunspace is attached, was not changed. This paper compares the performance of the sunspace system with 60° sloped double glazing and movable insulation to the sunspace on the same building consisting of vertical quadpane glazing with high transmission film and no movable insulation. Data for the two systems include transmittance of the glazing system, heat loss and net gain of the glazing system measured using a net radiometer and compared to UAΔT calculations, temperature swings in the sunspace, and overall building performance.

30485 **Survey of design tools for Passive and Hybrid Low Energy Buildings.** Rittelman, P.R.; Ahmed, S.F.; Davy, J.E. (Burt Hill Kosar Rittelman Assoc., Butler, PA). pp 93-98 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A survey of design tools for Passive and Hybrid Low Energy Buildings has been undertaken as part of the International Energy Agency (IEA), Solar Heating and Cooling Program. A total of 164 design tools have been surveyed. The design tools have been categorized in various ways. The need for further design tools development for certain application has been identified.

30486 **The Residential Energy Manual: An example of use and comparison of results to detailed computer simulation.** Derickson, R.G.; Holtz, M.J. (Professional Engineering Services, Fort Collins, CO). pp 99-104 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper discusses the application of the Residential Energy Manual (REM) heating calculation procedure to design problems and compares the REM Method results to BLAST simulations. The background, technical basis and calculation procedure are briefly described. The use of the REM Method is shown on a 1,600 square foot passive solar home located in Denver, Colorado. Comparison is made between the REM Method and the BLAST simulation values.

30487 **QUIKPAS: A microcomputer based tool for passive solar design.** Bryan, H. (Massachusetts Inst. of Technology, Cambridge, MA). pp 83-88 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Recently a microcomputer version of CALPAS 1 known as MICROPAS has been developed by the State of California. This paper describes an enhanced version of MICROPAS which we are calling QUIKPAS. This program uses the core algorythms of MICROPAS but the input and output sections have been restructured to facilitate user friendliness. The program was developed around a set of full screen input menus, where design parameters can easily be created, stored, replaced or changed to determine the effects of design alternatives. At any time during the input process the designer can ask for help if any entry is not understood; thus, program documentation is available on the screen, not just in a support manual. The program output, like the input, is menu driven so that the designer can select only that part of the output that is of interest. Various output features can be combined (in spreadsheet fashion) to create user defined tabular or graphic output displays. Future developments that will further increase the program's power and usefulness to the designer are also discussed.

30488 **Use of electronic spreadsheets as design tools.** de Camp, R.L.; Hallagan, W.B. (Princeton Energy Group, Princeton, NJ). pp 65-70 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

30489 **New programs for computer aided design.** Chisti, I.; Huston, B.; Mallette, E.E.; Miller, K.A. pp 89-92 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

30490 **Measured versus SLR-predicted performance of a monitored direct gain home.** Tsongas, G.; Gillen, P.; McKinstry, M. (Portland State Univ., Portland, OR). pp 321-326 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The purpose of this paper is to compare the actual energy usage of an occupied, newly constructed direct gain home with the original Volume II SLR predictions made during the building's design process and post-design Volume III predictions. The latter predictions have been made using the more appropriate correlations with both the original input data as well as data revised on the basis of observations and measurements resulting from five months of a Class B monitoring program. Both the predicted and measured results are presented. The key questions to be answered are: how good were the original predictions, how much better (or worse) are the predictions based upon the newer correlations and improved input data, and how can actual use of the predictive methodology provide better answers? Because detailed monitoring results are available, the sensitivity of the predicted results to a number of key parameters is analyzed and discussed. The parameters examined include: the setpoint temperature, the infiltration rate, the internal gains, and differences between the R-values of design-specified and as-built building components. Based on the results of this comparative study, recommendations are made for appropriate usage of the SLR design methodology, and needs for improvements in the methodology itself are also noted.

30491 **Heating season performance and thermal characteristics of the NCSU solar house.** DeCicco, J.M.; Boyers, A.S.; Eckerlin, H.M. (North Carolina State Univ., Raleigh, NC). pp 327-332 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.S. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper presents an analysis of heating season performance of the North Carolina State University Solar House. A microcomputer based data acquisition system was used for detailed monitoring during four periods in the winter of 1982-1983. Measurements of 52 temperatures and 4 insolation values in and around the structure were recorded for subsequent analysis. Electrical usage was metered separately for lighting and appliances, domestic hot water, and auxiliary heat (heat pump). Manual logs were kept noting building occupancy and the operation of controllable building features. Using this information, experimental estimates were made of the building loss coefficient, balance point temperature, and other thermal parameters. Monthly building energy consumption was broken down into internal gains, auxiliary heat, and solar gains for both 1981-1982 and 1982-1983 heating seasons. Performance was consistent for the two seasons and the results presented here confirm the effectiveness of the house design.

30492 **One time measurement of the infiltration rate and conductive loss coefficient for houses in California--Class B sites.** Mahajan, S.; Morandi, P.; Mort, D.; Newcomb, C.; Shea, M. (California State Univ., Sacramento, CA). pp 241-245 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

In this paper the measurements of infiltration in residential structures using tracer gas (SF_6) and blower door techniques are compared. Careful measurements using both techniques were made in eleven energy conserving and passive solar houses in California.

During all the measurements, the weather conditions were monitored continuously. Using the data from the blower door measurements, the wind induced and stack induced parameters are calculated. These parameters are then used to calculate the infiltration rates for weather conditions under which tracer gas measurements were The agreement of blower door predictions and experimental tracer gas results are quite good. Results suggest that one should use the blower door methodology for infiltration measurements. The latter has the advantage of giving the instantaneous infiltration rates once the wind speed and the temperature difference between inside and outside is known.

30493 **Passive solar/gas fired heating system characterization and development.** Burns, P.; Armstrong, P.; Winn, B. (Colorado State Univ., Fort Collins, CO). pp 3-8 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

An overview of the work presently being performed in the REPEAT facility is presented. The physical characteristics of the building and the instrumentation are described. Some collected data are next presented and discussed. A brief treatment of parameter estimation ensues which concludes the paper with an example calculation.

30494 **Construction and preliminary performance data on two commercial buildings with active charge/passive discharge solar systems.** Polka, R.; Farrer, R. (New Mexico Solar Energy Inst., New Mexico State Univ., Las Cruces, NM). pp 301-305 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Two commercial buildings recently constructed in Las Cruces, New Mexico, incorporate low-cost active charge/passive discharge solar systems. The metal roofs of the buildings are used as solar collectors on sunny winter days; in each building, warm air from the space beneath the roof is blown through a rock bed underneath the concrete floor. Heat from the rock bed is transferred passively through the floor slab to the space above. In summer, air from the rock bed is circulated under the metal roof at nighttime to provide some cooling for the rock bed and for the building. The construction of the buildings is described. Preliminary performance data are discussed; this indicates that the metal roofs provide a significant amount of heat in winter but that the cooling cycle is not operating efficiently.

30495 **Passive solar and utility load management: Implications for design performance goals and time-of-use utility rates.** Keniston, S.; Ottinger, C.W. (Keniston & Mosher, San Diego, CA). pp 307-310 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

30496 **Class C survey data versus computer predictions: A comparison between field data and simulations.** Mahajan, S.; Hodapp, E.; Jones, M.; Morandi, P.; Mort, D.; Newcomb, C.; Pond, B.; Shea, M. (California State Univ., Sacramento, CA). pp 311-316 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Following the Solar Energy Research Institute's (SERI) Class C survey strategy sixty-three passive solar houses located throughout California were visited and detailed information collected from the homeowners including architectural plans, management procedures, major energy uses, photographs, and at least one year of utility billing data. Using these data, inputs for DOE 2.1 and CALPAS 3.01 computer codes were prepared, and the predicted monthly energy use was obtained. The energy use predicted by the codes was compared to the energy use estimated from the billing data. As measure of performance the Building Performance Index (BPI) for each house was calculated using the billing data and the simulated performance. Both computer codes do quite well in predicting the BPI calculated from the billing data considering the difficulty of estimating the energy delivered and often having different weather in the two methods.

30497 **Measurement-based calculation of infiltration in passive solar performance evaluation.** Hamilton, B.; Duffy, J.; Persily, A.; Sachs, B. (The Memphremagog Group, Burlington, VT). pp 295-300 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Low-cost, measurement-based techniques for calculation of infiltration as a variable in passive solar performance evaluation are suggested as an improvement over the use of an assumed constant air-change rate. Results of infiltration measurements and calculations are reported for 70 passive solar homes. Comparisons are made between two infiltration estimation techniques for 41 of these monitored buildings. The 50 Pascal air leakage rate of 67 of these buildings is compared to selected data on the leakage of non-solar buildings.

30498 **Measured total performance of a solar home using concrete masonry.** Howard, B.D. (National Concrete Masonry Assoc., Herndon, VA). pp 283-288 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The Roberts Home (Sundance I), located in Reston, Virginia, is a 214 square meter (2300 square foot) three level passive-hybrid solar residence using a single glazed, 62 m^2 (663 ft^2) Trombe wall with automated movable insulation and a 9.1 m^2 (98 ft^2) single sloped glazed sunspace. Concrete masonry comprises an inner core thermal mass, including an air-core hybrid storage system. The winter building heat load was met by 52% passive solar heating, 12% auxiliary backup and 36% internal heat generation. The internal gains were high compared to other monitored buildings. The auxiliary heating thermal integrity was a low 17.77 kJ/m^2 / HDD (0.86 Btu/ ft^2/HDD).

30499 **Heat distribution by natural convection.** Balcomb, J.D.; Yamaguchi, K. (Los Alamos National Lab., Los Alamos, NM). pp 289-294 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Natural convection between spaces in a building can play a major role in energy transfer. Two situations are investigated: convection through a single doorway into a remote room and a convective loop in a two-story house with a south sunspace where a north stairway serves as the return path. A doorway-sizing equation is given for the single-door case. Detailed data are given from the monitoring of airflow in one two-story house, and summary data are given for five others. Observations on the nature of the airflow and design guidelines are presented.

30500 **Performance and evaluation of a passive solar superinsulated residence in the Northeast.** Thornton, R.K. (Tufts Univ., Medford, MA). pp 271-276 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A large passive solar superinsulated house has been built in Lexington, MA, (42,4°NL, 6100°F days) and energy use has been monitored for the 198283 heating system using a SERI Class B Passive Solar Data Acquisition System. The house was maintained at an approxmate average (and almost constant) temperature of 70°F, no window coverings of any sort were used, and the solar aperture of the house received approximately 52% of possible solation due to shading by leafless deciduous trees during the heating season. Under these conditions, the house used 0.89 Btu $^{\circ}F^{-1}day^{-1}ft^{-2}$ living area of delivered auxiliary heat. The actual indoor-outdoor temperature difference was used in this calculation. Using base 65 degree days for 1982-83 from the Blue Hills weather station the result is 0.76 Btu $^{\circ}F^{-1}day^{-1}ft^{-2}$ living area. If the 672 ft^2 70°F basement is included the numbers become 0.82 and 0.70. At a cost of $ 0.70/therm the cost of the purchased fuel for space heating this large house was just under $100.

30501 **Two years experience: thermal performance and operating data of the first German 2-story greenhouse retrofit in the city of Kiel, West Germany.** Berndt, G.W.P. pp 277-282 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper describes the renovation of a single-family dwelling built in Kiel, West Germany, in 1951. Special consideration will be given to the passive solar planning criteria which are relatively new to West Germany. The paper discusses problems encountered in the planning, in acquiring approval from the proper authorities, and in the construction process itself. Heating energy consumption preceding and following renovation as well as the thermal performance in the "Wintergarten" during different seasons will be shown. The measured results obtained have been evaluated and translated into planning suggestions for current house construction.

30502 **The Hodges residence: Four years of monitoring performance and occupant reactions.** Hodges, L. (Iowa State Univ., Ames, IA). pp 247-252 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The Hodges Residence, an award-winning 2200 square foot superinsulated direct gain passive solar home in Ames, Iowa, has been occupied and monitored for four winters and three summers. It has served as Iowa State University's de facto passive solar research home, with particular emphasis on studying the effects of variations in operation. Thermal performance results are given for different seasons, with and without the use of night insulation, using only off-peak heating, with deliberate natural ventilation during wintertime, and so forth. Psychological impacts on the occupants are also described, with emphasis on temperature swings, glare, indoor air quality, and the use of a masonry floor. Reactions of visitors are also reported.

30503 **Transformations: The design process in residential retrofit active hand / passive design.** Lawrence, V.; Katzenbach, C.B. (Sunstone Design, Hopewell, NJ). pp 1047-1052 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The author's experience as owner, designer, and builder in the architectural and energy renovation of an early 1800s farmstead in Central New Jersey is reported. Innovative passive design concepts were carefully integrated with the traditional features of an old fieldstone farmhouse to achieve an 85% reduction in the nonrenewable energy use. The study documents the processes and quantitative effects of the energy conserving strategies employed, from insulation and caulking to the addition of a two-story "sunspace" which utilizes the stone mass of the structure as an integral heat storage medium. Emphasis is placed upon the integration of the "new" with the "old" and the importance of user/client involvement in the design choices made. In addition to design and details, cost and performance data are presented where appropriate.

30504 **Smith House, Tannersville, New York.** Robinson, S. (New York, NY). pp 1015-1016 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

At the beginning of the design process, the clients proposed three priorities: (1) a space and use program for a young, growing family, (2) an urge toward energy self-sufficiency using conservation, solar, wood and wind in the most cost-effective applications, (3) a profound sensitivity to the Art of the local home building traditions which include High Victorian, Stick and Shingle and the Arts and Crafts Movement. The project has been in progress for 15 months. Site visits were made in each season and extensive microclimatic data were gathered or recorded. Construction began June 1, 1983.

30505 **The Van Teeckelenburgh Residence.** Zdepski, M.S. (New Jersey Inst. of Techn., Newark, NJ). pp 1009-1014 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The description and analysis of a passive solar residence with double, southeast and southwest, orientation. The design includes automated sun tracking insulation, supplementary phase change heat storage system, mass sod roof and interior ventilation systems. Testing and computer assisted thermal modeling indicate unique advantages for the dual orientation design.

30506 **The Umbach Residence as a responsible solar design for a cold, cloudy climate.** Black, R.A. (Sunstructures, Inc., Ann Arbor, MI). pp 1005-1008 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

In a time of ever-increasing energy and construction costs for housing, we find that the homes which do get built are either relatively inexpensive or relatively expensive, with less and less in between. Many good attempts are being made to resolve the energy-efficient, low-cost residence. Yet in contrast, the mid-to-high range market moves on with "business as usual" in spite of economic recession, and many, if not most of these types, still exude an obese and wasteful opulence. This paper attempts to show the inroads passive solar is making into responsible and responsive development of these "separatist" single-family detached residences, hopefully giving their owners a "nudge in consciousness" to their role in local and national energy scenarios. The Umbach Residence located in Saginaw, Michigan, (43.3°N, 7,400 heating degree days (1) and less than 50% average annual sunshine) is such a house. Designed for a successful, young and growing family, it encloses 2,800 square feet of living space and employs energy conserving and passive solar features throughout.

30507 **The custom passive solar sunspace: some design alternatives.** Spears, J.W. (Silver Spring, MD). pp 999-1003 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

During the past few years new housing has become more difficult to afford. Many people are turning to upgrading their existing homes to meet their changing needs. Passive solar additions are a popular way to improve an older home. They provide added living space, bring sunlight into dark interiors, reduce heating costs, and add to the resale value of the house. Passive solar greenhouses also provide growing space for vegetables and house plants and provide a wonderful source of recreation for the home owner. The design of the custom sunspace addition requires trade-offs between performance, architectural integration and the owner's needs. This leads to some very interesting design solutions that bear no resemblance to the "optimum" sunspace design generated by computer simulations.

30508 **Passive solar strategies as a logic for improved architectural design: two prototypes for modular housing.** Reeder, B.C.; Merkezas, C. (ARCHETYPE, Washington, DC). pp 993-998 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

In developing two passive solar modular housing prototypes for mass production, design research was done by ARCHETYPE. This research was directed toward effectively utilizing the strengths of the current modular industry, and developing climatically responsive, economical and beautiful solutions that would expand the market, save energy, and stimulate do-able qualitative change within the modular industry. Herein we present some of the data derived from that research which has been incorporated within our framework for future design.

30509 **Multi-site library design - South Bend branch libraries.** Troyer, L.; Beard, W.; Cartwright, P.; Lawecki, D.; Ponko, B.; Smith, D. (LeRoy Troyer and Assoc., Mishwaka, IN). pp 989-992 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This report addresses the development of a single energy-frugal branch library design to accommodate four different sites in the city of South Bend, Indiana.

30510 **Solar elements as classical counterpoint: passive solar design and the revitalization of historic buildings.** Reeder, B.C.; Merkezas, C. (ARCHETYPE, Washington, DC). pp 983-988 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper presents how passive solar strategies have been used by ARCHETYPE in the design Logic for the restoration, renovation, and infill of historic buildings. A design process and two representative projects are described. One project involves a large 84 year old detached Georgian style house. The goal of the project was to restore the original classical historic structure, and renovate and add to the building in such a way as to reinforce its Geogian character and proportion, and, at the same time, exploit the excellent solar orientation and improve the energy efficiency of the house. The second project concerns a 10,000 square foot Beaux Arts townhouse built in 1880 and located in the heart of the historic district of Dupont Circle in Washington, DC. Renovation and restoration of this landmark building for use as professional offices provided an opportunity for the incorporation of passive solar strategies that were by-products in the search for increased efficiency in spatial utilization and architectural enhancement. Both projects have been recognized by local and national preservation groups, proving that passive solar strategies can be successfully compatible with this area of design concern.

30511 **A few examples of passive solar architecture in Switzerland.** Stuby, F.C. (ARAS, Begnins). pp 977-982 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper presents a few examples of passive solar architecture in Switzerland as seen through the projects and building experience of the architect and as lived in and felt in the daily life by the "users."

30512 **The "folded plate roof" - a unique problem solver.** Dunning, A.; Sneesby, D. (SOLCON, Inc., Los Alamos, NM). pp 967-969 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The folded plate roof has been used successfully by designers and builders for three generations. Its unique strength and simplicity of construction are well established. This paper will review two such plans as applied to solar additions and their thermal performance. The design concept allows for the development of large, pleasant interior spaces while providing ideal angles for solar gain at any latitude. It can be built of inexpensive materials (2 x 4s and plywood) and adjusted for broad spans on widely spaced centers as in these passive solar examples. Our construction firm has specialized in solar plans and remodeling for the past five years. During this time we have found that the sun is even more reluctant to negotiate the design than the client. Problem southern obstructions have frequently obliged us to resort to roof apertures for our solar gain. The most effective system we have used is a folded plate roof design. This sawtooth configuration can be angled to optimize winter gain without unreasonable nighttime loss or summer overheating.

30513 **Passive solar houses without furnaces in the high Rockies.** Holloway, D.R. (Boulder, CO). pp 961-966 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Recently completed buildings in the author's architectural practice have shown convincingly that passive solar architecture in the high Rockies can achieve nearly 100% space heating and summer cooling at conventional building cost. It is now possible to own a home in this region that requires no auxiliary fossil fuel or electrical energy for heating or cooling--no back-up fans or motors. Back-up wood stoves may be necessary to achieve comfort for a small percentage of the time--depending on the user's willingness to dress appropriately. Utilizing a flexible combination of closed-cell Trombe walls, direct-gain fenestration, floor mass, and solarium/solar chimney in a well-insulated open-plan building, we have been able to achieve comfort during all seasons in settings from 6,000 to 10,000 degree-days F. The two projects that follow, the Champion Residence and the Soft House, also gives witness to the author's fondness for the Domus Aurea built in 1st Century Rome.

30514 **A contextual approach to daylighting.** Paul, P.D. (Paul Partnership, New York, NY). pp 955-960 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Contextual aspects, that is the effect of surrounding landscape and buildings are more important than sky brightness in determining the quality of daylight in interior spaces. By using traditional design techniques that consider context, daylighting becomes a dependent source of natural light for public buildings used during the daytime. This paper focuses on daylighting principles determined from the collective experience of traditional building forms, applying them to a recently completed DOE commercial passive solar demonstration project: Essex Dorsey Senior Center in Essex, Md. Daylighting and cooling are integrally related as both require a shallow high ceiling space and emphasize perimeter.

30515 **The Provo Office Complex.** Wilcox, B.A.; Gumerlock, A. (Berkeley Solar Group, Berkeley, CA). pp 949-953 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The design concept for the Provo Office Complex in Provo, Utah includes a series of south-facing clerestories for daylighting and passive solar gain in this severe Rocky Mountain climate. An artificial lighting scheme is well-integrated with the strong and successful daylighting scheme. In addition, the design concept includes the integration of the architectural and mechanical components through the use of an AIRFLOOR concrete floor to provide a second return plenum. In conjunction with the return air plenum in the ceiling, a double return system is established where the most thermally beneficial return path can be used, depending on the temperature of the floor, the office space and the outdoor environment. Thus the thermal mass of the floor can be used to improve both the heating and cooling performance of the building.

30516 **Medium density passive solar production housing.** Cohlmeyer, J.C.; Giaccardo, M.A.; Jones, M.A. (Mark Jones Corp. Santa Fe, NM). pp 943-948 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The authors' previous work in passive solar production housing was reported in the Sixth Passive Solar Conference with a report on a two unit speculative housing development. This paper describes a completed 31 house passive solar housing development in Santa Fe, New Mexico. It reviews three house types heated by Trombe walls, direct gain or underfloor thermosiphon systems. The paper focuses on site planning, microclimate evaluation, solar access, architectural shading elements and natural cooling strategies.

30517 **Suncatcher Monitoring Project: three years of monitoring.** Maeda, B.T. (Earth Integral Inc., Davis, CA). pp 931-936 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The Suncatcher Monitoring Project has accumulated a wide variety of data on the Nittler/Maeda Suncatcher house located in Davis, California. The Suncatcher is an innovative passive solar house designed by Living Systems of Winters, California. Highlights of the data include a 81.5% solar heating fraction during the full monitoring period from March 1, 1978 to July 1, 1981, a 100% natural cooling fraction for the three and one half summers monitored, and an average 40% increase in solar gain through the clerestory glass due to the Suncatcher design relative to ordinary south facing vertical glass. Due to various problems, the hourly data acquisition system functioned intermittently during the monitoring period, but hourly data were gathered about 35-45% of the time and daily data was 99% complete. The daily data was gathered as both a complement and a supplement to the hourly data from September 1, 1977 to July 1, 1981. The total collected data has allowed a reliable estimate of the Suncatcher house's performance for both solar heating and natural cooling.

30518 **A thermal history of the Kelbaugh House.** Kelbaugh, D. (Kelbaugh & Lee Architects, Princeton, NJ). pp 925-930 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The Kelbaugh House in Princeton, New Jersey, the first to incorporate a Trombe wall in the U.S.A., has been monitored for annual energy consumption since 1975. Auxiliary space heating, as well as DHW, cooking and electricity consumption have been recorded for eight years. Results are shown in tabular and graphic form and discussed in light of improvements made to the house over the years.

30519 **Building as hearth- The articulation of building mass in Colorado architecture.** Barrett, D. (Sun Flower Architecture, Boulder, CO). pp 921-924 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Responding to a high altitude environment, Colorado residential architecture is being shaped by intense solar radiation, extreme seasonal temperature swings, potent winter winds and abundant snowfall. The emerging architecture finds form in responding to these forces through the articulation of mass and glass. Out of this expression of architectural mass, a new sense of hearth is evident as building mass is coupled with the sun to provide radiant warmth to the inhabitants.

30520 **Solar passive heating in Greece.** Stambolis, C. (Heliotechnic Ltd., Athens). pp 907-911 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper reviews the state of the art of the solar passive heating field in Greece. Some generally applicable climatological data are first presented and hence the need and suitability of solar passive heating is explained. Examples of climatologically adapted dwellings from the antiquity and from modern vernacular Aegean architecture are discussed. Some modern solar passive applications are presented together with computer calculated estimates of the performance of direct gain and Trombe wall examples. The paper concludes that solar passive heating in Greece is desirable both on economic and architectural grounds.

30521 **Three passive solar architectures in Tokyo.** Kato, Y. (Yoshio Kato Atlier, Tokyo). pp 903-906 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Japanese traditional architectures have had passive methods for natural energy, and so it is not difficult for the client to agree about passive design in spite of most of the people thinking that the technology will advance in the future. But it may take time to broaden it because the society has seen high energy equipment. Consulting with each client to agree, it is important to find a common advantage.

30522 **Comparison of design tools: Carried out by member countries of the EEC.** Littler, J.G.F. (Polytechnic of Central London, London). pp 895-898 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Of the main frame and mini computer models examined, ESP and SUNCODE were found most appropriate for the design of passive solar dwellings in Europe. ESP will be developed further within the EEC Passive Solar Programme and SUNCODE within the UK National Programme. Of the small models, SPIEL, LANL III, CASAMO and Methode 5000 were recommended.

30523 **International Energy Agency Task VIII: description and selected results.** Holtz, M.J. (NAHB Research Foundation, Westminster, CO). pp 889-894 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper discusses the background and results achieved to date of an International Energy Agency Solar Heating and Cooling Program Task on Passive and Hybrid Solar Low Energy Buildings. Task objective, approach and participants are presented as well as results from two international surveys on simulation models and design tools. Conventional reference buildings are described representative of typical design and construction practice in each participating country. Climate similarities are compared through a simple graphic technique. Work in progress is briefly discussed.

30524 **Moisture Control in passive buildings in warm humid climates.** Khattar, M.K. (Florida Solar Energy Center, Cape Canaveral, FL). pp 861-866 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Moisture Control in passive residential buildings in warm, humid climates has been a persistent problem. Tighter construction and use of a vapor barrier in building envelopes have led to the accumulation of internally generated moisture in winter as well as in summer. In winter, infiltration and ventilation are effective in reducing indoor humidity levels. Figures are presented to show how these processes can effectively remove internally generated moisture as a function of outside and desired inside conditions. Mechanical cooling and dehumidification are essential in the design of passive buildings in warm, humid climates. While passive cooling strategies can reduce cooling requirements, they do not reduce the need for dehumidification. Air conditioners, which are commonly used in passive buildings, do not remove enough moisture from the air because they operate for limited periods of time due to the reduced cooling load in passive structures. This results in a high humidity level in these homes. The humidity problem is aggravated when high efficiency air conditioners are combined with passively cooled buildings. Since these air conditioners can cool more efficiently, they operate for an even shorter period of time, thus removing even less moisture from the air. The following analysis presents the average inside conditions in a "typical" and a "passive" Florida home using both a conventional and a high efficiency air conditioner.

30525 **Sunspace performance and design flexibility in three climates.** Lerner, R.A.; Lenchek, T.; Spencer, G. (Northern Sun, Lynnwood, WA). pp 797-800 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

In the struggle to achieve a livable, affordable, and appealing solar architecture, the sunspace stands out as a much maligned and often misunderstood entity. Subjects of costs, materials, size, use, structural integration, and even appropriateness are controversial among practitioners. But most solar designers will agree that sunspace configurations with glazing restricted to the south face, with roof and endwalls insulated, produce the greatest energy benefits for the home to which it is attached. This notion is supported by analytical studies and the common-sense physics of solar collection and abundantly reinforced by the popular solar literature. In fact, this so-called "optimum" design geometry may offer minimal or no net energy benefits to homeowners over more highly glazed configurations, while considerably constraining the design. The conclusion for designers and contractors of sunspace projects is to recommend and implement projects that satisfy their clients' functional and aesthetic needs and desires. Energy savings, at least over a broad range of climates and designs, will not be compromised.

30526 **Comparison of single-zone gas and multi-zone electric heating systems for passive solar homes in the northern United States.** Oster, J.R.; Admed, S.F.; Madariaga, H.A. (Burt Hill Kosar Rittelmann Assoc., Butler, PA). pp 785-790 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Single zone (gas) and multi-zone (electric) heating systems are compared for five cities in Northern United States. The source energies for heating systems have been compared. The difference between source energies of two heating systems has been found to be proportional to the heating degree days. The comparison of central cooling system and multi-zoned cooling system is also made.

30527 **Total solar: Hybrid photovoltaic, passive-hot-water and illumination fluorescent-concentrator solar-energy system.** Beebe, R. (OUR FUTURE, San Francisco, CA). pp 765-768 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

An inexpensive modular solar-energy system is proposed. The unique feature of this system is that direct as well as diffuse sunlight is collected by non-tracking fluorescent concentrator panels. Light trapped within these panels is reflected out through their edges and into a light-transmitting structure, then "piped" through this structure into buildings or vehicles where it is used for illumination and to generate electricity and heat. Optical joints retain light collimation through the structure, connecting together individual light-guide sections at corners and intersections. Light extraction units can be located anywhere along the structure; at night they are supplied with light by a single electric light source integral to the structure. In this paper the system's component mechanisms are examined, and theoretical system applications and performances are discussed.

30528 **A state of the art thermosiphon system.** Agnew, W.C.; McIntosh, W.C. (Mark Jones Corp., Santa Fe, NM). pp 761-764 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The Mark Jones Corporation's work in developing air thermosiphon systems in Santa Fe has been previously reported in the Fifth and Sixth Passive conferences. The previous papers traced the development of two generations of thermosiphons, the first using rock storage, the second rock plus block storage. This paper examines the development and construction of a third generation thermosiphon system built into a relatively expensive custom home. It focuses on the simplified construction techniques of a block bed storage system in which no rocks at all are used for heat storage. An innovative damper door is also presented.

30529 **An integrated phase change heating and cooling system for retrofit and new construction.** Darby, R.; Wright, D. (David Wright Associates, Nevada City, CA). pp 755-760 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper discusses the performance characteristics and retrofit potential of a promising new method of utilizing phase change material (PCM) for heating and cooling of structures. A commercially available phase change salt compound with a phase change temperature of 22.8°C (73°F) is used. The PCM is located within the building structure itself (floors and ceilings) and can be either actively or passively charged. Discharge can also be either passive through radiation and natural convection or active by using fan forced airflow. The system is capable of providing summer cooling operation as well as winter heating operation. General performance characteristics are discussed with respect to various methods of integrating the system into building design. Methods of integrating this system into retrofit and new construction is developed along with a discussion of active/passive charging options and passive distribution methods. Design variations and construction details are also presented.

30530 **Energy savings potential for attached sunspaces in different climates.** Ritschard, R.L.; Huang, Y.J. (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA). pp 739-742 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Sensitivity analyses were performed using a modified DOE 2.1a code to model sunspace options attached to the south side of a one-story ranch house. Simulations were run in 11 representative cities with different climatic conditions for four sunspace configurations. The sunspace was eight feet in width, and either 12 or 24 feet long and was modelled with a glass or an opaque roof. The sunspace results were compared to a base case house without a sunspace but with similar thermal integrities. Parametric results showed that a sunspace operated under the conditions assumed in this study was able to contribute to the heating loads of the house to which it was attached. An appropriately oriented, designed and operated sunspace will heat itself if one tolerates a sunspace usable only during the day. In a few locations, an attached sunspace will also substantially reduce heating loads for the entire house.

30531 **High performance passive solar heating systems with heat pipe energy transfer and latent heat storage.** van Dijk, H.A.L.; de Wit, M.; van Galen, E.; Hensen, J. (Inst. of Applied Physics TNO-TH, Delft). pp 709-714 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Preliminary results are reported from a current project on the development of a high performance passive solar heating system. Two special components are introduced: a. A heat pipe as a thermal diode tube for the efficient transfer of collected solar heat from the absorber plate to behind an insulation layer. b. A latent heat storage section with high storage capacity at moderate operating temperatures. Additional advantageous characteristics: the maintenance costs are negligible, and the performance is highly insensitive to unadequate control of the system by the inhabitants. A first global design of the system showed significantly higher predicted gains than a conventional storage wall at however still high manufacturing costs, although the costbenefit ratio was already competitive with a similar active solar system. The project will be concluded at the end of 1983, with an optimized design of the system. First optimization exercises and series of measurements on the single components lead to the expectation that the final optimized design will be characterised by significantly reduced manufacturing costs.

30532 **Product update on options for north-facing glazing.** Davids, B.J.; Franta, G.F. (Alpen, Inc., Lakewood, CO). pp 705-708 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

With careful selection of glazing materials, even north-facing windows can become "net gain" surfaces in passive solar design. Several clear insulating glass products are examined and compared on the bases of net annual energy performance and relative cost. The analysis includes standard insulating glass, as well as high performance glazings utilizing low-emissivity coatings, antireflective coatings, and substitute gas fill. Net heating energy flux is calculated for both moderate and severe winter climates, and glazing performance is compared to typical night insulation systems and to an insulated wall.

30533 **Research on solar food drying at the University of California, Santa Cruz.** Archulets, R.; Berkey, J.; Williams, B. (Univ. of California, Santa Cruz, CA). pp 679-683 of Progress in passive solar energy systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Research at the University of California, Santa Cruz farm has examined small-scale solar cabinet food dryers. Sun drying and direct and indirect solar convection dryers have been monitored for operating temperatures, drying times, and solar insolation. Each dryer has been evaluated with respect to ease and cost of construction, utility, operating temperatures, and quality of their respective dried products. The relative vitamin C content of spinach and cantaloupe before and after drying has been examined to determine the product quality of the tested units.

30534 **Sizing solar energy systems for agricultural applications and predicting seasonal energy applications and predicting seasonal energy utilization.** Hietala, J.S.; Jacobson, L.D.; Janni, K.A.; Johnson, V.J.; Jordan, K.A. (Northern States Power). pp 705-741 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Sociaty Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

A preferred method for sizing energy systems based on economic considerations was developed in this paper. The use of rules of thumb developed for residential applications is not valid because of the underlying assumptions of the air entering the collector and the need to provide sufficient ventilation air for animal wellbeing. The problems of determining a heat balance from field measurements of solar energy available are minor; however, the determination of the amount of purchased energy which can be replaced by solar energy is complex and requires careful evaluation of system leaks, animal heat production, transient storage of heat, and ventilation rates. Experimental evaluation of solar utilization was found nearly impossible and simulation methods were used to obtain ready answers even though verification with field data is needed, particularly for thermostatically controlled ventilation systems. Nevertheless, simulation methods hold the greatest hope for developing agricultural rules of thumb similar to those developed for the residential trade, and developments in this area are encouraged.

30535 **Large passive "breadbox" water heater.** Bolme, B.M.; Norlin, J.A. (Corps of Engineers, Portland District, Portland, OR). pp 777-780 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

30536 **Superinsulated batch heaters for freezing climates.** Bishop, R.C. (Passive Solar Coop, Denver, CO). pp 807-810 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

An innovative batch-type passive solar water heater has been developed in Denver, Colorado, over the past two years by the Passive Solar Co-op. It is designed for year-round use in Denver's 3300°C -day (6000°F -day) climate, and prototypes have performed very well even in sub-freezing winter conditions. The innovations are very simple, consisting of a manufacturing technique incorporating high levels of insulation and a multi-glazed window of thin high transmission solar films to reduce heat losses from the unit without appreciable losses of solar gains.

30537 **Results of monitoring flat-plate, batch, and solar/wood domestic water heaters.** LaVigne, A.B. (Puget Sound Power and Light Co., Bellevue, WA). pp 801-806 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

During the first year of the project, three flat-plate solar water-heating systems, an active site-built, a passive site-built, and an active commercially built system, were monitored. Data controls were the solar systems operated in a nonsolar, electric-only mode, a standard electric water-heating system, and the average single family residence with electrically heated water in the Puget Power service area, predominantly western Washington. During the second year of the project, a batch solar system and a solar/ wood/photovoltaic system were monitored. To help isolate the effects of solar energy from other parameters influencing the amount of electricity used to heat water, measurements were also made on the effects of lifestyle and water-heating system insulation levels.

30538 Performance of integrated passive solar water heaters in U.S. climates. Cummings, J.; Clark, G. (Trinity Univ., San Antonio, TX). pp 791-796 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Results presented are based on partially validated, hourly simulations of passive solar domestic water heating systems for selected typical years in 10 cities. The simulated system is an integrated (or "breadbox") collector/storage unit plumbed as a preheater for a conventional gas or electric heater. The base case unit was latitude tilted and contained 4 cylindrical tanks plumbed in series within an R16 box. The aperture and projected absorber area were 1.62 m^2, and total tank volume was 145 liters. Water draw was 151 liters/day at 50°C. A variety of design performance sensitivity results are presented. The single-glazed, selective absorber design is recommended. For this design the passive heater delivered 42% to 51% of the annual solar irradiance to the load. Corresponding solar savings fractions ranged from 0.27 (Seattle) to 0.64 (Phoenix). System efficiency decreases significantly as area and solar savings fraction increase beyond the base case. Night insulation (R9) increases base case delivered energy by about 20% in cold and warm climates. Freezing is unlikely except in the coldest climates. If the installed cost of the single-glazed, selective unit is $420 after tax credits, the simple payback period when displacing electricity is about 5 years in all cities except Seattle.

30539 Results of testing and modeling passive solar DHW systems. Robison, D.; Reichmuth, H. (Oregon Dept. of Energy, Salem, OR). pp 771-776 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Comparisons of test results and simulations for batch and thermosiphon passive solar DHW systems. The simulation model is a thermal network model using simplified heat up and cool down tests to establish the efficiency parameters. Simulated results are compared with the SRCC-200 test results and field data. A comparison shows that the simplified tests give equivalent results to the SRCC rating method and, in addition, are capable of predicting performance under a wide range of climatic and usage conditions. Corraboration of the model demonstrates that it can predict individual draws, daily energy outputs and annual solar performance to a high degree of accuracy. Results are also compared to the California PUC method of calculating performance estimates.

30540 The optimization of a commercial refrigeration system (with ambient cooling, ice storage and superinsulation). Amistadi, H.R. (EnerCrop, Burlington, VT). pp 743-748 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The proposed system will utilize winter climate as an annual source of cooling by taking advantage of natural ambient temperatures to freeze ice as a source for cooling. A passive freon heat pipe and ice storage system will provide the necessary cooling for refrigeration. The Refrigeration/Economic Loads Optimization Program, or RELOP, explores the various proportions of ice storage and superinsulation to discover the economically-optimized combinations of the two.

30541 Performance evaluation of a thermosiphon/blockbed system. Morris, W.S. (Morris Research and Design, Santa Fe, NM). pp 265-269 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper describes the performance of a thermosiphon air collector which was designed and built to heat the masonry floors of a residence in Santa Fe, New Mexico. The system uses ten different blockbeds, composed of concrete block on their sides, to transfer the heat to the floor above. Simple monitoring techniques were employed in February of 1983 to determine typical winter day performance of this passive solar heating system, and the results are evaluated in this paper along with recommendations for future systems.

30542 Geographic limits for comfort in unassisted roof pond cooled residences. Fleischhacker, P.; Clark, G.; Giolma, P. (Solar Data Center, San Antonio, TX). pp 835-838 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Heat load calculations for a 1224 square foot roof pond building have been made for 35 locations across the United States. Except for the roof pond feature, the building is of standard low-mass construction on a concrete slab foundation. Interior air temperature was calculated using a simple empirical method. The comfort benefits of "wet" and "dry" ponds and of ceiling fans were evaluated. The resulting interior temperatures were plotted on a map of the U.S. The plotted contours are lines to the north of which roof pond houses will provide comfortable temperatures without additional air conditioning at 6pm on a July 2 1/2% ASHRAE design day. Comfort can be achieved on such a day in a ceiling fan assisted dry roof pond residence in most of the geographic area of the U.S. Comfort is most difficult to provide with this passive system in the desert of Southwest Arizona and Southeast California.

30543 (DOE/CS/34039—T6) Solar Energy Education. Renewable energy activities for chemistry and physics. (State Univ. of New York, Albany (USA)). [1985]. Contract AC01-77CS34039. 67p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85010371.

Information on renewable energy sources is provided for students in this teachers' guide. With the chemistry and physics student in mind, solar energy topics such as absorber plate coatings for solar collectors and energy collection and storage methods are studied. (BCS)

30544 (DOE/CS/34039—T9) Solar Energy Education. Renewable energy: a background text. (New York State Dept. of Education, Albany (USA). Solar Energy Project). [1985]. Contract AC01-77CS34039. 208p. NTIS, PC A10/MF A01; GPO Dep. File Number DE85010365.

Some of the most common forms of renewable energy are presented in this textbook for students. The topics include solar energy, wind power hydroelectric power, biomass ocean thermal energy, and tidal and geothermal energy. The main emphasis of the text is on the sun and the solar energy that it yields. Discussions on the sun's composition and the relationship between the earth, sun and atmosphere are provided. Insolation, active and passive solar systems, and solar collectors are the subtopics included under solar energy. (BCS)

30545 (DOE/R2/05175—T1) Design fabrication and testing of a low cost ceramic collector panel. Final report. Earl, W.A.; Johnson, P.F.; Sisson, J.C. (New York State Coll. of Ceramics, Alfred (USA)). Feb 1983. Contract FG42-80R205175. 163p. NTIS, PC A08/MF A01; GPO Dep. File Number DE85013340.

Thesis. Submitted by J.C. Sisson.

The effects of fabrication procedures on the thermal performance of various ceramic systems for active solar applications were investigated. A shale-based structural clay body was used as a standard. This body was also coated with silicon carbide, a glossy black glaze and a matte black glaze. Metal samples used included copper, aluminum and aluminum coated with a flat black paint. Experiments were performed using a solar test box linked to an automated data acquisition system. Temperatures of samples were recorded at 3 min. intervals for 4 h solar periods. An F-statistical analysis was performed on the resulting data and was correlated with total solar emittance, total solar reflectance and monochromatic reflectance as a function of incident wavelength. The information above was also utilized in developing a computer model used to simulate the performance of various materials in active solar testing. Results suggest that a structural clay body fired to maturity and coated with a matte black glaze could be commercially useful for applications requiring large quantities of heated water.

30546 **(FRCEA-R—15) Elaboration and characterization of a sputtered copper - stainless steel - amorphous carbon solar selective surface for use in evacuated collectors.** Wyon, C.; Valignat, J. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France)). 1983. 23p. (DMG—98-83). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751596.

A spectrally solar selective surface for use in evacuated tubular collectors has been fabricated by successively depositing: an opaque copper layer, a thin film of stainless steel and an amorphous carbon layer, by non reactive magnetron sputtering. The obtained material is particularly selective (αsub(s)>0,90; epsilonsub(300°C)<0,05) and stable up to 500°C. All these properties, associated with an easy setting to work allows to consider the use of this selective surface for mass production of high performance evacuated collectors.

30547 **(FRNC-TH—1631) Conversion coatings on stainless steels for solar energy absorbant materials. Influence of metallurgical and structural state of the metal on the properties of the films.** Benavente Garcia, R. (Toulouse-3 Univ., 31 (France)). Jul 1982. 169p. (In French). NTIS (US Sales Only), PC A08. File Number DE85751350.

The aim of this work is the development of a method for the elaboration of selective solar absorbers. The treatment of stainless steels by anodic oxidation in a solution of sulfuric acid and sulfides is examined for a chemical transformation of the surface. Metallurgical problems for the preparation of selective absorbers with foils of austenitic stainless steels are studied. Effect of work hardening and annealing on properties of conversion coatings is emphasized. Metallurgical properties, optical properties and physico-chemical nature are related. The thermal stability of the coating is excellent.

30548 **(N—85-16297) What should DOE do to help establish voluntary consensus standards for measuring and rating the performance of PV modules.** Runkle, L.D. (Jet Propulsion Lab., Pasadena, CA (USA)). Oct 1984. 54p. (NASA-CR—174265; JPL-PUBL—84-73). NTIS, PC A04/MF A01.

In response to concern expressed by the photovoltaics community over progress toward the establishment and issuance of concensus standards on photovoltaic performance measurements, a review of the status of and progress in developing these standards was conducted. It examined the roles of manufacturers, and consumers and the national laboratories funded by the U.S. Department of Energy (DOE) in supporting this effort. This was done by means of a series of discussions with knowledgeable members of the photovoltaic community. Results of these interviews are summarized and a new approach to managing support of standards activity is recommended that responds to specific problems found in the performance measurement standards area. The study concludes that there is a positive role to be played by the U.S. Department of Energy in establishing collector performance measurement standards. It recommends that DOE continue to provide direct financial support for selected committees and for research at national laboratories, and that management of the activity be restructured to increase the authority and responsibility of the consensus committees.

30549 **(NP—5770293) Technological and economic aspects of the use of plastics for solar engineering.** Binder, K. (Oesterreichisches Kunststoffinstitut, Vienna). 1979. 99p. (In German). NTIS (US Sales Only), PC A05/MF A01. File Number DE85770293.

Plastics with their various properties are very valuable and low-priced "materials made to measure" in solar technology. Outstanding properties are: corrosion resistance, low-weight, excellent insulation, high transparence. The physical processes of collectors are explained and the general characteristics of plastics are outlined e.g. molecular structure, mechanical properties, corrosion and weather resistance, thermal and optical properties. Plastics are used for absorbers, covers, collector housings, thermal insulation materials for collectors, sealing material, plastic collectors. Further information on: plastics for the high-temperature range (process heat), storage facilities, heat distribution (pipe systems and radiators), absorber covers, swimming pool covers. Tables on standard prices for various materials.

30550 **(NP—5900976) Development of an inexpensive solar collector cum storage system for agricultural requirements. Final report to the Tata Energy Research Institute, Bombay for Project P041.** Garg, H.P. (Indian Inst. of Tech., New Delhi. Centre of Energy Studies). Jan 1983. 228p. NTIS (US Sales Only), PC A11. File Number DE85900976.

The effect of various climatic, design, and operating parameters for improving the performance of some fixed configuration type of conventional and novel type of solar air heaters are examined. Other improvements considered are (1) effects of expanding the heat transfer area by Porous-bed absorber, and (2) of using selective absorbercoatings (i.e. $\epsilon = 0.1$). The results obtained from the theoretical research work for conventional solar air heater and porous bed solar air heater have been used to construct a flat plate solar air heater of area 4 m^2 and a rock bed collector cum storage system, also of area 4 m^2. Both the above units have been combined together in a series installation known as augmented integrated solar collector and storage system. Performance characteristics of the augmented integrated rock collector and storage system are also included in present report. Moreover, this newely constructed (AIRS) unit is under thorough experimentation.

30551 **(SERI/PR—255-2493) Identification of chemical and physical phenomena affecting the durability of silvered polymer (PMMA) mirrors.** Schissel, P.; Neidlinger, H.H.; Czanderna, A.W. (Solar Energy Research Inst., Golden, CO (USA)). May 1985. Contract AC02-83CH10093. 42p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012131.

Mirrors are the devices of choice in concentrating solar radiation for solar thermal applications. Efficiency requirements and economic factors dictate that the mirrors maintain high reflectance (over 90%) for many years (at least 5). Depending on the concentration ratio called for, the mirrors must have such surface perfection (specularity) that they can deliver all their reflected energy into an angle of 1 to 5 milliradians (mrad). Other design factors such as weight, flexibility (shatter resistance), and cost make silvered polymer films highly desirable for solar thermal use. The work reported here reveals some of the factors that affect the durability and performance of silvered polymer films in outdoor exposure. The results presented are based on laboratory analyses of various polymers silvered by various processes. The crucial role in degradation played by ultraviolet (uv) light is shown by several experimental results. Uv screens in the polymer improve weatherability. Inconel uv blockers improve adhesive performance. Weather-Ohmeter studies comparing exposures with and without uv radiation show more rapid degradation due to uv. Fourier transform infrared (FT-IR) studies show synergistic effects with uv, chlorine, and silver; but again control of uv is a major factor in enhancing mirror durability.

30552 **Surface analysis of silver mirrors made from organometallic solutions.** Pitts, J.R.; Thomas, T.M.; Czanderna, A.W. (Solar Energy Research Inst., Golden, CO). *Solar Energy Materials;* **11**: No. 4, 261-271(Dec 1984). Contract AC02-83CH10093.

Silver mirrors, made by decomposing organometallic resinate solutions, have been studied using surface analysis techniques to secure information about the silver/glass interface. The mirrors have also been characterized using SEM, EAX, thickness, reflectance, resistivity, accelerated corrosion testing and adhesion measurements. The mirrors exhibit excellent adhesion at the silver/glass interface and good corrosion resistance. Depth profiles using XPS, ISS and SIMS for analysis have been taken on the mirrors. From these studies, evidence for an increased silicon to oxygen ratio at the silver/glass interface is presented. In the silvering process, it is thought that the silver-containing Lewis base decomposes when in contact with glass at elevated temperatures (T > 400 deg C) to deplete the glass of surface oxygen, or silicon from the resinate deposits to enrich the glass surface. It is suspected that covalent silver to silicon bonds are formed during decomposition of the organometallic solution and reaction with the silicon rich glass surface and that these bonds are responsible for the excellent adhesion and thus, good corrosion resistance of the mirrors. (A.V.)

30553 Polymer degradation on reflecting metal films: fourier transform infrared (FTIR) reflection-absorbance studies. Webb, J.D.; Schissel, P.; Thomas, T.M.; Pitts, J.R.; Czanderna, A.W. (Solar Energy Research Inst., Golden, CO). *Solar Energy Materials;* **11:** No. 3, 163-175(Nov 1984). Contract AC02-83CH10093.

The technique of Fourier transform infrared reflection-absorption (FTIR-RA) spectroscopy has been successfully adapted to the study of bulk and interfacially activated photodegradation of several types of polymers on various metallic substrates. The technique enables qualitative and quantitative study of photochemical reaction mechanisms and rates. A controlled Environmental Exposure Chamber (CEEC), which permits collection of IR-RA spectra of the polymer/metal samples during their exposure to controlled spectral distributions of UV, temperatures, and gas mixtures, was built into the sample compartment of a Nicolet 7199 FTIR spectrophotometer. Surface analysis, gel permeation chromatography (GPC), UV spectroscopy, and UV spectroradiometry were used to complement the FTIR-RA results. (A.V.)

30554 Results of validated simulations of roof pond cooled residences. Clark, G.; Doderer, E.; Haves, P.; Loxsom, F. (Solar Data Center, Trinity Univ., San Antonio, TX). pp 823-828 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Results based on new validated simulations of roof pond cooled residences (RPR) in 14 hot U.S. cities are reported. Radiant heat transfer dominates heat removal from the RPR interior and from the pond exterior. The RPR is a water-conserving cooling technology even in arid climates. In all but arid climates the ventilated RPR requires dehumidification to prevent mold and mildew. Ceiling condensation is frequent in humid climates. Total heat removal from the interior is only about 100-140 Btu/ft^2 day. The RPR must be very well insulated in order to maintain interior comfort conditions below PMV=0.5 in the hottest climates. Ceiling fans are essential for comfort in most climates. PMV=0.5 conditions are found to be comfortable by other recent comfort criteria.

30555 Energy savings potential of dehumidified roof pond residences. Vieira, R.K.; Clark, G.; Faultersack, J. (Trinity Univ., San Antonio, TX). pp 829-834 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

The energy displacement potential of roof pond cooling in humid climates is sensitive to the type of dehumidification equipment employed and the humidity levels allowed. This paper reports the simulated energy requirements of roof pond residences assisted by two high efficiency dehumidifier options. One dehumidifier is a vapor compression air conditioner with sensible cooling recovery by an air-toair heat exchanger (referred to as an "improved mechanical dehumidifier (IMD)"). The second option is a solar regenerated desiccant dehumidifier (SRDD). Results for 15 cities were compared to simulation results for a very energy conserving conventional house. The simulation was performed using typical April through October meterological data. Comfort was controlled to a predicted mean vote (PMV) of + or -0.2 and relative humidity was controlled to 68% or less to prevent mold and mildew growth. An IMD assisted roof pond house had energy savings of 30 to 65% in humid climates and 90% in dry climates compared to the conventional house. An SRDD assisted roof pond house had energy savings of 70 to 75% in humid climates. Conventional house peak power demand was displaced by 10 to 60% in an IMD assisted roof pond house and 50 to 75% in an SRDD assisted roof pond house. A method is given relating the energy savings to July dew point average and annual cooling degree days.

30556 Second generation point focused concentration on the next step. Hein, R.E. (Martin Marietta Denver Aerospace, Denver, CO). pp 831-835 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Around 1975 the concept of multiple sun concentrators was starting to become more than a fantasy. In the fall of 1978, 10KWe of point focused concentrators were installed at Sandia National Laboratories, Albuquerque, New Mexico. These were considered by most as experimental. They had a 2-1/4 in. diameter silicon solar cell which was illuminated to 33 suns using an acrylic Fresnel lens which was approximately 1 ft square. Next came the "improved" second generation design. It utilized single crystal silicon float zone cells with a textured surface. Concentration had gone from 33 suns to 110-125 suns, and the Fresnel lens was less than 8 in. square. The cell had been reduced from a 2-1/4 in. diameter to approximately a 1 in. square. Cell efficiencies have gone from less than 10% to greater than 17% in the newest second generation designs. Before the second generation can be fully commercialized, work has already begun on a third generation using 400-600 sun concentration levels. It is expected these will be seen in module prototype forms by mid 1984.

30557 A vector computer graphic procedure for calculating the irradiated area of collector surfaces in buildings. Johnston, S.A. (Miami Univ., Oxford, OH). pp 71-76 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

This paper describes the strategy and mathematical algorithms used in the Solar Graphics computer program for determining the portion of a solar collector area exposed to the sun at any given time. A hidden line algorithm is used in conjunction with simple vector algebra to redraw the outline of the irradiated portion of the collector and to compute its area. Work is currently under way at the University of Wisconsin-Milwaukee to merge this capability with SHOW, an interactive computer graphic program, and with FCHART 4.0, a solar design program. The combined program that is being developed is called Solar Graphics. The vector/hidden line procedure, however, is written as a stand alone subroutine to Solar Graphics called Solar Test (SOLTST) that could be incorporated into other FORTRAN main programs with graphics capabilities.

30558 The performance of a roof-pond solar house, The New Mexico State University experience. Mancini, T.R. (New Mexico State Univ., Las Crucas, NM). pp 811-815 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

Presented in this paper are some of the results of tests performed with the New Mexico State University Passive Solar House during the summers of 1981 and 1982. The house is a roof-pond solar house in which movable insulating panels are used to control both the collection and rejection of energy for both the heating and cooling of the conditioned space. Of particular importance to the present study is the effect of several parameters on the cooling performance of the system. The results indicate that insulating air cells (even though deflated) have both positive and negative effects on the performance of the system; that an increase in the water pond depth from 7.5 to 15 cm results in a decrease in the temperature swing of the water which is approximately proportional to the increase in the thermal mass of the house; that the difference between the daily average ambient temperature and daily average water bag temperatures for water bags cooled by evaporation (in addition to convection and radiation) is twice that of the bags cooled by radiation and convection alone; and that the cooling of the house is not sensitive to the opening and closing times for the insulating panels as long as they are open during the early morning hours and closed prior to sunrise. In addition to the performance of the house in the cooling mode of operation, some of the maintenance and operational characteristics of the system are discussed.

1420 Heat Storage

30559 (BFR-R—32-1983) **Sunstore experimental house in Sigtuna. Performance measurement and assessment 1981-1982.** Platell, O.; Wikstroem, H. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1983. 44p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. File Number DE85750850.

This report describes operation, performance measurements and assessment of the Sigtuna house for the period from 1981-05-01 to 1982-05-30. The house has 126 m² of solar collectors, a ground heat store with 4223 m deep holes and a closed heat distribution system. A computerized instrumentation and recording system has been installed, continously recording temperatures in the ground, solar collector performance and solar energy yield from the two groups of solar collectors. Isotherms have been drawn for the ground heat storage at different times, and energy yield tabulated on a day-by-day basis. The results have been compared with theoretical values obtained from programs developed and used in Sunstores R and D work. Good agreement has been observed, and further improvements of the design programs have been applied. The storage capacities of individual channels in the heat store have been confirmed. Total solar energy yield during the season has been limited due to thee fact that the various zones of the heat store have not been optimally used. A low-temperature heating system has provided heat to the house.

30560 (BFR-R—35-1983) **Solar heating with seasonal heat storage in clay for 500 houses in Kristianstad. A feasibility study.** Green, E.; Goeransson, B.; Maartensson, B.G. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1983. 39p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. File Number DE85750851.

Hammar, a residential area in Kristianstad, Sweden, is found to be suited for incorporating a heat storage system into its district heating system. At present, 170 apartments are connected to the district heating system and in the future approx 175 new flats will be built and connected. In Hammar, clay layers of 15 m thickness are available for thermal storage. The thermal capacity of the clay is about 0.9 kWh/m³ and deg. C. The storage system is planned to incorporate solar collectors (on the roofs of the new buildings), the heat store and a heat pump plant for heat extraction. The existing fuel-oil boilers will be used for topping and reserve. The heat accumulator is planned to have a volume of 274000 m³ and will comprise 137000 m plastic tubes (vertically oriented) for heat injection/extraction. With a temperature difference of 8 C degrees (+20-+12 C degrees) the thermal capacity will be about 2000 MWh. The yearly heat loss will be some 400 MWh. 4000 m² of solar collector will be needed. The solar heat can either be used directly (via the heat pumps) or be stored. The solar heat/thermal store can deliver 3900 MWh/year, including the 900 MWh of electric energy used by the heat pumps. Cost estimates, pay-off time etc. are given in the report.

30561 (BFR-R—46-1983) **Bore hole heat store in rock. Investigation of an alternative heat store for the Soedertuna solar heating project.** Andersson, S.; Eriksson, A.; Johansson, S.; Ljung, L. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1983. 95p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. File Number DE85750853.

The objective of this work has been to investigate the technical feasibility of seasonal storage of heat in a borehole heat store in rock. Use of such a heat store is being considered for the Soedertuna solar heating project, (an IEA project). The work involves primarily alternative system designs, study of thermal processes and investigation of the geological and hydrological conditions associated with, and required for, a borehole heat store. Simplified economic comparisons have been carried out between heat storage in a water tank and in a borehole heat store. The results from the work show that: - A borehole heat store should incorporate temperature zoning. - Heat pumps should be included in the system. - Peak power output from the solar collectors should be smoothed out in a buffer heat store. - Geohydrological conditions are favourable at the proposed site in Soedertuna. - A fullscale borehole heat store in rock appears to be economically preferable to the water tank alternative. However, for smaller installations, the heat losses from a borehole heat store may be excessive. - A borehole heat store can be expanded in stages as required. - The environmental impact of a borehole heat store is slight. Compared with other alternatives for large scale heat storage, the borehole heat store appears to be economically competitive.

30562 (DTH-LV-MEDD—162) **Heat storage for solar heating systems.** Furbo, S. (Danmarks Tekniske Hoejskole, Lyngby. Lab. for Varmeisolering). Sep 1984. 284p. (In Danish). NTIS (US Sales Only), PC A13/MF A01. File Number DE85750804.

Danish and European test procedures for heat storages for solar heating systems have been developed. The suitability of the test procedures has been evaluated by means of calculations of the accuracies of the measurements and by means of the experiences gained by the tests. Test facilities for heat storages for solar heating systems for domestic hot water supply have been built. The accuracy of the measuring equipment of the test facilities has been investigated in detail. The type of heat storage consisting of a hot water tank with a built-in heat exchanger spiral has been investigated thoroughly. A detailed computer model simulating the thermal behaviour of this type of heat storage, in periods with heat supply as well as in periods without heat supply, has been developed. The computer model has been validated by means of experiments. Special tests as well as the above mentioned developed test procedures were used for the validation. The yearly thermal performance for small solar heating systems for domestic hot water supply has been calculated based on the Danish Test Reference Year and the validated computer model with different designs of the control system and of the heat storage. Based on these calculations it is possible to optimize the design of the heat storage. The problems concerning the stability of heat-of-fusion storages as well as a principle solving the stability, have been mentioned. Different heat-of-fusion storages making use of the principle, have been described. Two heat-of-fusion storages for solar heating systems for domestic hot water supply have been developed. These storages have been investigated by means of experiments in the test facilities. Based on these experiments it is assessed how the work concerning development of a suitable heat-of-fusion storage for solar heating systems for domestic hot water supply can be continued.

30563 (FRNC-TH—1915) **Theoretical and numerical study of a heat storage model using fusion heat.** Morel, A. (Paris-13 Univ., 93 - Villetaneuse (France)). 1981. 66p. (In French). NTIS (US Sales Only), PC A04/MF A01. File Number DE85751583.

A theoretical and numerical study of heat transfers in a heat accumulator model for a solar power station made up of a cylindrical chamber containing rows of circular tubes perpendicular to its axis containing an accumulator material with a heat carrying fluid circulating longitudinally in the chamber is developed in this thesis.

Lab. for Varmeisolering). Jan 1984. (In Danish). NTIS (US Sales Only), PC A16/MF A01. File Number DE85770191.

Also published as DTH-LV-R-83-39.

In Technological development and its impact on the future energy system. Appendix 1. Evaluation commissioned by the Danish Ministry of Energy.

Use of different energy sources in combined heating systems will require heat storage. Pond heat stores have small heat losses during short storage periods. For seasonal storage the high-temperature store has to be over 500.000 m^3 in order to keep losses under 10%. Solar heat - based district heating will be competitive with the conventional one first when solar collectors cost 500 kr/m^2.

30565 **Advanced phase-change storage for passive solar heating analysis of materials and configuration.** Christensen, C.B. (Solar Energy Research Inst., Golden, CO). pp 693-698 of Progress in Passive Solar Energy Systems. Hayes, J.; Andrejko, D.A. New York, NY; American Solar Energy Society Inc. (1983). (CONF-830929—).

From 8. national passive solar conference; Santa Fe, NM, USA (5 Sep 1983).

In this paper the authors discuss the performance of phase-change materials (PCMs) as thermal storage in passive solar heating systems. The authors discuss factors, other than material properties, that affect storage performance and optimization. They also briefly describe solid-state phase-change materials (SS PCMs) and list typical material properties. Results from a parametric analysis of PCM Trombe walls and discuss the factors that limit performance are given. Configurations for enhanced PCM performance and simulation results for an idealized case are presented.

Current plans for the Geothermal Deep Drilling project are discussed including program objectives, major participants and their roles, description of the drilling site and its scientific potential, plans for drilling and data acquisition, description of facilities for brine handling and reinjection, and project schedule. The overall objectives of the program are to provide an assessment of the deep geothermal resource and to afford an opportunity for the scientific community to conduct tests during and after drilling under a parallel program sponsored by DOE, NSF, and USGS. At the conclusion of the DOE/Bechtel drilling and engineering program, a resource evaluation report will be prepared. Bechtel is prime contractor and is responsible to DOE for overall management of the drilling, well testing, and resource evaluation activities. Kennecott will supply sites for the deep well and brine reinjection well along the shores of the Salton Sea near Niland. This site should yield extremely high downhole temperatures. Plans call for drilling to a depth of approximately 10,000 feet, with drilling to begin in the first quarter of 1985. As the first activity in the Continental Scientific Deep Drilling Program, this project represents an exciting opportunity for the entire geothermal community.

30569 **(DOE/ET/28393—T8) Evaluation of low-temperature geothermal potential in north-central Box Elder County, Utah.** Davis, M.C.; Kolesar, P.T. (Utah Geological and Mineral Survey, Salt Lake City (USA)). Dec 1984. Contract AS07-77ET28393. 113p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85009541.

The low-temperature geothermal resources of north-central Box Elder County, Utah were assessed. Exploration techniques used included chemical analyses of water from wells and springs, temperature surveys, and temperature-depth measurements in unused wells within the study area. The highest water temperatures (31°, 30°, and 29°C) recorded in this research were located in three separate geographic regions, suggesting that no single warm water occurrence dominates the study area. Total dissolved solid (TDS) concentrations ranged from 294 to 11,590 mg/l. Areas of warm water occurrences generally had TDS values of greater than 1100 mg/l. Reservoir temperatures were estimated using chemical geothermometers. Calculated temperatures ranged between 50° and 100°C. Temperature-depth measurements were logged in 16 unused wells. Thermal gradients calculated from the profiles ranged from isothermal to 267°C/km. The background gradient for the study area appears to be slightly above the average Basin and Range gradient of 35°C/km. The highest gradients were calculated for the area approximately eight kilometers west of Snowville, Utah, which is also an area of warm water. 61 refs., 15 figs., 6 tabs.

(Idaho Dept. of Water Resources, Boise (USA)). Dec 1984. Contract AS07-77ET28407. 60p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85012905.

Water Information Bulletin No. 30.

A limited chemical and isotopic investigation was undertaken and geological, geophysical, and hydrological data in the literature were reviewed to evaluate the geothermal potential of the Boise area. 68 refs., 12 figs., 4 tabs. (ACR)

30572 **(DOE/ID/12478—T9) Feasibility of geothermal applications for greenhousing and space heating on the Pine Ridge Indian Reservation, South Dakota.** Culver, G. (Oregon Inst. of Tech., Klamath Falls (USA). Geo-Heat Center). Feb 1985. Contract FG07-83ID12478. 39p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85009786.

Although little is known about the geothermal resources under the Pine Ridge Reservation, there seem to be good possibilities of a resource hot enough to provide heating for greenhouses, at least in the northeast portion of Shannon County. At the present time, there do not appear to be resources hot enough to provide direct use space heating of residential or commercial buildings near any of the existing population centers. Space heating using water source heat pumps may be economical and should be considered for new construction of larger heat users such as the proposed hospital at Pine Ridge. Further resource investigation is recommended, particularly more surface geology and water chemistry work. Test drilling will be required to confirm the availability of both direct use and heat pump required temperatures and flows. It is estimated that geothermal energy could be delivered to a greenhouse operation in northeast Shannon County for $4.71 per million Btu's. This compares to $11.67 for propane, the least expensive competing conventional fuel. Other factors such as availability of qualified labor, market demand, transportation, availability of power, etc. must be considered. 8 refs., 3 figs., 2 tabs.

30573 (LBL—18268) **Modeling of geothermal systems.** Bodvarsson, G.S.; Pruess, K.; Lippmann, M.J. (Lawrence Berkeley Lab., CA (USA)). Mar 1985. Contract AC03-76SF00098. 23p. (CONF-850312—2). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012553.

From SPE annual California regional meeting; Bakersfield, CA, USA (25 Mar 1985).

During the last decade the use of numerical modeling for geothermal resource evaluation has grown significantly, and new modeling approaches have been developed. In this paper we present a summary of the present status in numerical modeling of geothermal systems, emphasizing recent developments. Different modeling approaches are described and their applicability discussed. The various modeling tasks, including natural-state, exploitation, injection, multi-component and subsidence modeling, are illustrated with geothermal field examples. 99 refs., 14 figs.

30574 (LBL—18520) **Technology transfer report: feasibility study for the use of geothermal brine in the Ashdod area, Israel.** Benson, S.M. (Lawrence Berkeley Lab., CA (USA)). Aug 1984. Contract AC03-76SF00098. 41p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85013316.

The hydrothermal potential of the Ashdod area, Israel, was evaluated to determine its suitability as the low grade energy source required to operate the Ashdod desalination plant. An estimated 1250 cubic meters per hour of 120°C brine would be adequate to supply the hot water necessary for operating the desalination plant. Considerable interest in oil exploration in the Ashdod area resulted in the drilling of six wells into the Jurassic formations by Oil Exploration (Investments) Ltd. (OEL) in 1976-1980. A small amount of oil was found in two wells, Ashdod 2 and 5. The remaining wells were abandoned as "dry holes". Evaluation of the drill cuttings, cores, and the electric logs defined two lithologic units of potential interest for hydrothermal exploitation, the Zohar and Shderot Dolomites. Investigation of the hydrothermal potential of the Jurassic formations underlying the Ashdod area has revealed that the aquifer temperatures range between 85 and 92°C. The hydrologic parameters are not well defined; however the matrix permeability of the dolomites and limestones is probably between 1 and 10 md. This is insufficient permeability for a large scale pumping operation such as the one required to operate the desalination plant. Therefore, successful utilization of the resource requires the presence of significant fractures and/or connected vugs in the formation. The very low well productivity and formation plugging may indicate that permeability of the fracture zones may easily be impaired, suggesting that the fracture zones are not suitable production intervals. Until a test is conducted on a properly completed well, it is not possible to evaluate the deliverability of wells tapping these aquifers. 14 refs., 8 figs.

30575 (CONF-8410179—, pp 305-317) **Tracer flow in fractures.** Horne, R.N. (Stanford Univ., CA). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

The transport of tracers through geothermal reservoirs is primarily through fractures, and the understanding of the flow mechanisms is a key step before interpretive analysis of tracer returns is possible. Two principal mechanisms have been studied by the Stanford Geothermal Program, tracer dispersion within the fracture and tracer diffusion into the rock matrix. An experimental study of tracer dispersion has recently verified our earlier theoretical derivation for one-dimensional transport. The theoretical and experimental studies of tracer retention mechanisms have suggested a method for the interpretation of tracer return histories, and have shown remarkable correspondence with field test measurements.

30576 (CONF-8410179—, pp 319-342) **Status of the Cerro Prieto project.** Lippmann, M.J.; Manon M., A. (Lawrence Berkeley Lab., CA). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

As part of its program in geothermal energy, funded by DOE/GHTD under the Reservoir Definition Program, Lawrence Berkeley Laboratory (LBL) has continued to carry out studies of the Cerro Prieto geothermal system and has kept abreast of the latest developments at the field. The FY1984 effort has been significantly smaller than in previous years because of the lack of a formal agreement for continued technical cooperation between DOE and the Comision Federal de Electricidad of Mexico (CFE), operator and manager of the Cerro Prieto field. The earlier agreement is expected to be signed before the end of 1984. Recent LBL studies of Cerro Prieto have been restricted mainly to analyzing field data gathered earlier and to updating the models of this geothermal field on the basis of new well data and studies performed by CFE.

30577 (CONF-8410179—, pp 344-357) **Geothermics, an alternate energy source for power generation.** 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

The history of geothermal energy development in Mexico is reviewed and current activities in geothermal development are discussed. The role that geothermal energy can play in meeting Mexico's energy needs is examined.

30578 (DOE/ID/12026—T11) **Geothermal resources of the Washakie and Great Divide basins, Wyoming.** Heasler, H.P.; Buelow, K.L. (Wyoming Univ., Laramie (USA). Dept. of Geology and Geophysics). 1985. Contract FC07-79ID12026. 63p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85013004.

The geothermal resources of the Great Divide and Washakie Basins of southern Wyoming are described. Oil well bottomhole temperatures, thermal logs of wells, and heat flow data were interpreted within a framework of geologic and hydrologic constraints. It was concluded large areas in Wyoming are underlain by water hotter than 120°F. Isolated areas with high temperature gradients exist within each basin. 68 refs., 8 figs., 7 tabs. (ACR)

30579 (DOE/SF/12196—9) **Indications of mineral zoning in a fossil hydrothermal system at the Meager Creek geothermal prospect, British Columbia, Canada, from induced polarization studies.** Ward, S.H.; Zhao, J.X.; Groenwald, J.; Moore, J.N. (Utah Univ., Salt Lake City (USA). Earth Science Lab.; Ministry of Geology, Beijing (China); Utah Univ., Salt Lake City (USA). Dept. of Geology and Geophysics). May 1985. Contract AC03-84SF12196. 40p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85011962.

By measuring the induced-polarization parameters m (chargeability) and tau (time-constant) we have found evidence that the center of a presumed fossil hydrothermal system at Meager Creek, British Columbia, lies south of the main manifestation of the present-day convective hydrothermal system. What implication this finding has for development of the present-day system is unknown. However, some of the fractures formed during the development of the fossil hydrothermal system may serve as conduits for fluids of the present-day system. The analysis is limited by the lack of availability of a good subsurface distribution of core samples. Nevertheless, a surface induced-polarization survey is expected to yield information about the geometry of the fossil system. Such knowledge would have implications not only for Meager Creek but for other hydrothermal systems of Cascades volcano type. 16 refs., 15 figs., 1 tab.

30580 (NP—5770191, pp 7.1-7.20) **Heat storage. Seasonal storage in groundwater reservoirs.** Boldt, J.; Hagelskjaer, J.; Olsen, H. Jan 1984. (In Danish). NTIS (US Sales Only), PC A16/MF A01. File Number DE85770191.

EFP-81.

In Technological development and its impact on the future energy system. Appendix 1. Evaluation commissioned by the Danish Ministry of Energy.

In 1982 a demonstration groundwater reservoir storage was established. It has a capacity of about 1600 MWh and recovery effect of about 2 MW. Industrial scale cycle planned for 1983 was not realized as there were observed leaks in the clay cover layer. Storage methods are closely connected with chemical conditions, i.e. aqueous concentration of calcium carbonate, hardness etc. Aquifer storage depends on local geologic factors and dimensions of the reservoir.

30581 (CONF-8410179—, pp 285-297) **Crustal structure and tectonics of the Imperial Valley region, California.** Fuis, G.S.; Kohler, W.M. (Geological Survey, Menlo Park, CA). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

The US Geological Survey conducted an extensive seismic refraction survey in the Imperial Valley region of California in 1979. This region included primarily the Imperial Valley proper and West Mesa. Forty shots fired at seven shot points were recorded by 100 portable seismic instruments at typical spacings of 0.5-1 km. More than 1300 recording locations were occupied, and more than 3000 usable seismograms were obtained. We analyzed five refraction profiles, modeled an existing gravity profile across the Salton Trough, constructed a basement depth map, and produced a structure and tectonic summary map of the Imperial Valley region. Results are presented for each of these areas.

30582 (CONF-8410179—, pp 207) **Deep hole studies.** Elders, W.A. (Univ. of California, Riverside). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

The Salton Sea Scientific Drilling Project aimed at probing the roots of the Salton Sea Geothermal Area to a depth of approximately 3.1 km is described.

30583 (DOE/ET/28393—T7) **Evaluation of low-temperature geothermal potential in Utah and Goshen Valleys and adjacent areas, Utah. Part II. Water temperature and chemistry.** Klauk, R.H.; Davis, D.A. (Utah Geological and Mineral Survey, Salt Lake City (USA)). Dec 1984. Contract AS07-77ET28393. 75p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85009344.

Geothermal reconnaissance techniques have identified five areas in Utah County warranting further investigation for low-temperature geothermal resources. One area in northern Utah Valley is along Utah Lake fault zone and includes Saratoga Hot Springs. Water temperatures within this area range from 21 to 43°C. Common ion analyses as well as B and Li concentrations indicate waters sampled in this area are anomalous when compared to other samples from the same aquifer. Two other areas in southern Utah Valley also coincide with the Utah Lake fault zone. Common ion analyses, trace element concentrations, and Cl/HCO_3 ratios distinguish these areas from all other waters in this valley. Temperatures within these southern areas range from 21 to 32°C. All three thermal areas are possibly the result of deep circulation of meteoric water being warmed and subsequently migrating upward within the Utah Lake fault zone. The Castilla Hot Springs area has been expanded by this study to include a spring located 3 mi further up Spanish Fork Canyon near the Thistle earthflow. A temperature of 50°C was recorded for this spring and chemistry is similar to Castilla. In Goshen Valley, the fifth geothermal area identified, measured temperatures range from 20 to 27°C for some wells and springs. Chemical analyses, however, do not discern the location of low-temperature geothermal reservoirs. 18 refs., 7 figs., 5 tabs.

30584 (NMERDI—2-71-4221) **Evaluation of thermal remote sensing as a low-cost regional geothermal exploration technique in New Mexico. Final report.** Inglis, M.; Budge, T.K. (New Mexico State Univ., Las Cruces (USA). New Mexico Energy Inst.; New Mexico Univ., Albuquerque (USA). Technology Application Center). Mar 1985. 53p. NTIS, PC A04/MF A01 - NMERDI Univ. of New Mexico, 457 Washington SE, Albuquerque, NM 87108. File Number DE85901266.

Airborne and satellite borne thermal infrared scanner data were analyzed for application in the exploration of geothermal resources in New Mexico. The location for this study was the East Mesa Geothermal Field near Las Cruces, New Mexico. Primary sensor was the Thermal Infrared Multispectral Scanner (TIMS) which obtained data at 10-meter resolution. Additional data for comparison came from the Heat Capacity Mapping Mission (HCMM) satellite which provided data at 600-meter resolution. These data were compared to the soils, vegetation, and geology of the area, as well as borehole temperature data in an attempt to explain temperature patterns and anomalies. Thermal infrared scanner data were found to be too sensitive to solar-induced temperature anomalies to directly reflect the presence of subsurface geothermal anomalies but may provide valuable supporting information for a geothermal exploration program. 15 refs., 16 figs., 3 tabs.

1505 Economic And Financial Aspects

30585 (DOE/CE/30784—2) **Update and assessment of geothermal economic models, geothermal fluid flow and heat distribution models, and geothermal data bases.** Kenkeremath, D. (ed.). (Meridian Corp., Falls Church, VA (USA)). May 1985. Contract AC01-83CE30784. 120p. NTIS, PC A06/MF A01; GPO Dep. File Number DE85013028.

Numerical simulation models and data bases that were developed for DOE as part of a number of geothermal programs have been assessed with respect to their overall stage of development and usefulness. This report combines three separate studies that focus attention upon: (1) economic models related to geothermal energy; (2) physical geothermal system models pertaining to thermal energy and the fluid medium; and (3) geothermal energy data bases. Computerized numerical models pertaining to the economics of extracting and utilizing geothermal energy have been summarized and catalogued with respect to their availability, utility and function. The 19 models that are discussed in detail were developed for use by geothermal operators, public utilities, and lending institutions who require a means to estimate the value of a given resource, total project costs, and the sensitivity of these values to specific variables. A number of the models are capable of economically assessing engineering aspects of geothermal projects. Computerized simulations of heat distribution and fluid flow have been assessed and are presented for ten models. Five of the models are identified as wellbore simulators and five are described as reservoir simulators. Each model is described in terms of its operational characteristics, input, output, and other pertinent attributes. Geothermal energy data bases are reviewed with respect to their current usefulness and availability. Summaries of eight data bases are provided in catalogue format, and an overall comparison of the elements of each data base is included.

30586 (DOE/ID/12192—1) **Geothermal potential for commercial and industrial direct heat applications in Salida, Colorado. Final report.** Coe, B.A.; Dick, J.D.; Galloway, M.J.; Gross, J.T.; Meyer, R.T.; Raskin, R.; Zocholl, J.R. (Chaffee Geothermal Ltd., Denver, CO (USA); Western Energy Planners Ltd., Aurora, CO (USA)). Oct 1982. Contract FC07-81ID12192. 285p. NTIS, PC A13/MF A01; 1; GPO Dep. File Number DE84014797.

The Salida Geothermal Prospect (Poncha Hot Springs) was evaluated for industrial and commercial direct heat applications at Salida, Colorado, which is located approximately five miles east of Poncha Hot Springs. Chaffee Geothermal, Ltd., holds the geothermal leases on the prospect and the right-of-way for the main pipeline to Salida. The Poncha Hot Springs are located at the intersection of two major structural trends, immediately between the Upper Arkansas graben and the Sangre de Cristo uplift. Prominent east-west faulting occurs at the actual location of the hot springs. Preliminary exploration indicates that 1600 gpm of geothermal fluid as hot as 250°F is likely to be found at around 1500 feet in depth. The prospective existing endusers were estimated to require 5.02 x 10^{10} Btu per year, but the total annual amount of geothermal energy available for existing and future endusers is 28.14 x 10^{10} Btu. The engineering design for the study assumed that the 1600 gpm would be fully utilized. Some users would be cascaded and the spent fluid would be cooled and discharged to nearby rivers. The economic analysis assumes that two separate businesses, the energy producer and the energy distributor, are participants in the geothermal project. The producer would be an existing limited partnership, with Chaffee Geothermal, Ltd. as one of the partners; the distributor would be a new Colorado corporation without additional income sources. Economic evaluations were performed in full for four cases: the Base Case and three alternate scenarios. Alternate 1 assumes a three-year delay in realizing full production relative to the Base Case; Alternate 2 assumes that the geothermal reservoir is of a higher quality than is assumed for the Base Case; and Alternate 3 assumes a lower quality reservoir. 11 refs., 34 figs., 40 tabs.

1506 Environmental Aspects And Waste Disposal

30587 (CONF-8410179—, pp 259-271) **Presentation to Department of Energy geothermal conference.** Mitchell, R.; Orfanos, S.H. (Imperial County Courthouse, El Centro, CA). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

The history of geothermal development in Imperial County during the last decade is reviewed and some of the environmental problems that were considered important at the start of development are discussed. The environmental documentation associated with geothermal development is also discussed.

1508 Geothermal Power Plants

30588 (CONF-8410179—, pp 29-33) **Heber binary project.** Lacy, R.G.; Nelson, T.T. (San Diego Gas and Electric Co., CA). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

Recognizing the desirability of demonstrating the operation of a commercial scale, binary cycle, geothermal power plant, San Diego Gas and Electric Company (SDG and E) has formed a consortium consisting of three California utilities, the Electric Power Research Institute (EPRI), the State of California, and the US Department of Energy (DOE) to carry out the Heber Binary Project. The overall goal of the Project is to establish the economics and prove the operational viability of the binary cycle geothermal power plant.

30589 (CONF-8410179—, pp 35-40) **Heber geothermal power project #1 - dual flash.** Jacobsen, J.E. (Dravo Construction, Inc., San Jose, CA). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

The history of the 52 MW gross dual flash geothermal power plant in the Heber geothermal field is reviewed and construction progress to date is described. Commercial operation of the plant is scheduled for August 1985. Planning for a 2nd unit is underway.

30590 (CONF-8410179—, pp 41-50) **Magmamax power plant-success at East Mesa.** Hinrichs, T.C. (Magma Power Co., Escondido, CA). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

The history of development of the Magmamax Power Process is reviewed. Operating experience at the East Mesa 10 MW plant since the fall of 1982 is described and some possible future improvements are mentioned.

30591 (CONF-8410179—, pp 155-169) **Progress report: the Mammoth Geothermal Project.** Holt, B.; Campbell, R.G. (Ben Holt Co., Pasadena, CA). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

The status of construction and operation of two identical 3500 kw air-cooled binary cycle geothermal power plants in the Long Valley Known Geothermal Resources Area is reviewed.

30592 (CONF-8410179—, pp 181-187) **Development operations: hypersaline geothermal brine utilization, Imperial County, California.** Whitescarver, O.D. (Union Oil Co. of California). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

The geothermal resources of the Imperial Valley have been recognized for over a century. But early attempts to develop these resources met with frustration and failure. The geothermal fluids here are hypersaline, causing severe scaling and corrosion. After early development attempts proved unsuccessful, the Imperial Valley was put on the back burner of geothermal development, so to speak. But interest was renewed when the world energy situation changed in the 1970's and a national priority was put on the development of alternative energy resources. The oil crises of the 1970's brought new enthusiasm -- from both the public and private sectors -- to develop this geothermal resource. In the interim, Union Oil Company had developed geothermal projects at The Geysers in northern California and in the Philippines. These projects gave us the experience and technological expertise to come back to the Imperial Valley with new confidence and knowledge to solve the special problems presented by this resource. The result was the construction of two 10,000-kilowatt flash steam electric power generating facilities in the Brawley and Salton Sea anomalies. Using private investment dollars, these ongoing geothermal operations continue to provide valuable experience and new technology for greater development of the Imperial Valley geothermal resources. Achieving commercial use of this alternative energy resource becomes more promising every day as technical and economic obstacles are overcome.

30593 (CONF-8410179—, pp 106-131) **In-line process instrumentation for geothermal power plants.** Shannon, D.W.; Robertus, R.J.; Sullivan, R.G.; Kindle, C.H.; Pierce, D.D. (Pacific Northwest Lab., Richland, WA). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

The economics of geothermal power depend on satisfactory plant reliability and continuous operation. Plant problems and extended downtime due to corrosion failures, scale buildup, or injection well plugging have affected many past geothermal projects. If in-line instrumentation can be developed to alert plant operators to correctable problems, then the cost and reliability of geothermal power will be improved. PNL has completed a program of development of in-line corrosion and chemical instrumentation for binary cycle plants, and this technology has been used to set up a monitoring program at the Heber Binary Demonstration Power Plant. The current emphasis has shifted to development of particle meters for use on injection lines and CO_2 and pH probes for use in control of calcite scaling. Plans have been outlined to develop and demonstrate flash plant instrumentation for corrosion monitoring, scaling, steam purity, and injection line particle counting.

30594 (CONF-8410179—, pp 133-153) **Heat cycle research experimental program, FY-84.** Whitbeck, J.F. (EG and G Idaho, Inc., Idaho Falls). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

An advanced binary cycle development program is currently being conducted by EG & G for the Department of Energy. The program is aimed at increasing the viability of producing electric power from moderate temperature resources by obtaining significant increases in conversion system performance. This report briefly describes the Heat Cycle Research Facility in which the various tests are conducted, outlines the test program, and discusses the results obtained from the experimental program to date.

1509 Geothermal Engineering

30595 (CONF-8410179—, pp 89-102) **Geothermal pumping systems.** Hanold, R.J. (Los Alamos National Lab., NM). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

After successful field testing of a prototype pressurized lubrication system designed to prevent brine intrusion and loss of lubricating oil from the motor and protector sections of electric submersible pumps, a second-generation lubrication system has been designed, fabricated, and laboratory tested. Based on a sensitive downhole pressure regulator, this system is not depth limited and it accurately controls the differential pressure between the motor oil and the external brine. The first production lengths of metal sheathed power cable have been fabricated by Halpen Engineering and delivered to REDA for testing and evaluation. Laboratory tests performed on prototype metal sheathed cable samples have demonstrated the durability of this power cable design. The East Mesa Pump Test Facility is currently being activated for high-horsepower pumping system tests that are scheduled to commence during the first quarter of FY 85. A 300-horsepower REDA pumping system equipped with a pressure regulator controlled lubrication system and a metal sheathed power cable is being fabricated for testing in this unique facility.

30596 (CONF-8410179—, pp 209-218) **Advanced drilling development.** Kelsey, J.R. (Sandia National Labs., Albuquerque, NM). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

A new initiative by DOE/GHTD to cost share geothermal drilling technology development is discussed. An industry group, the Geothermal Drilling Organization (GDO), has been established to provide the basis for the industry funds. Sandia National Laboratories will act as the DOE representative for these cost shared projects. The structure of the Organization is discussed as well as a preliminary list of projects that are being considered for funding.

30597 (CONF-8410179—, pp 219-245) **Advanced materials for geothermal applications.** Kukacka, L.E. (Brookhaven National Lab., Upton, NY). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

Among the most pressing problems constraining the development and expanded use of geothermal energy resources for electric power generation is the lack of satisfactory component and system reliability. This is due to the unavailability, on a commercial scale, of cost-effective materials that can function in a wide range of geothermal environments and to the unavailability of a comprehensive body of directly relevant test data or materials selection experience. In 1976, the GHTD started the Geothermal Materials Program to address materials-related problems, and since 1978 Brookhaven National Laboratory has provided technical and managerial assistance in the implementation of the effort. Major successes have been attained in the development of elastomers for high-temperature applications and in the use of polymer concrete liners for corrosion protection. Both technologies have been successfully transferred to industry. Current and planned efforts in metallic and nonmetallic materials development and corrosion protection are summarized.

30598 (CONF-8410179—, pp 171-180) **Geothermal well stimulation program and experiments in the Imperial Valley.** Verity, R.V. (Republic Geothermal, Inc., Santa Fe Springs, CA). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

Republic Geothermal, Inc. and its subcontractors have planned and executed laboratory studies and eight well stimulation field experiments under the Geothermal Reservoir Well Stimulation Program. The program, begun in February 1979, has concentrated on extending petroleum industry stimulation technology for use by the geothermal industry. Two of the eight field experiments were performed in a well in the East Mesa field of the Imperial Valley. Stimulation of well East Mesa 58-30 provided the first geothermal well fracturing experience in a moderate temperature (350°F) reservoir with matrix-type rock properties. The two experiments consisted of a hydraulic fracture treatment of a deep, low-permeability zone and a staged hydraulic fracture treatment of a high-permeability mud and cement-damaged zone in the same well. Both treatments were technically and economically successful, and together doubled the producing rate of the previously marginal producer. Overall results of the program have shown that stimulation is viable where adequate reservoirs are penetrated by wells encountering formation damage or locally tight formations. However, wells in marginal naturally fractured reservoirs have not been saved by the types of well stimulation jobs performed thus far.

30599 **(DOE/NV/10150—6) Analysis of flow data from the T-F and S/DOE Gladys McCall No. 1 well. Final report.** Pritchett, J.W.; Riney, T.D. (S-Cubed, La Jolla, CA (USA)). Jan 1985. Contract AC08-80NV10150. 98p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85009464.

The flow and bottomhole pressure data have been analyzed for the two sands (Nos. 8 and 9) tested by the Gladys McCall No. 1 Well. The more productive sand (No. 8) appears to be bounded by two linear faults at distances of ~740 ft and ~1360 ft from the well and there appears to be a decrease in the formation transmissivity away from the well. The formation properties inferred from the well test analysis have been used with a reservoir simulator to match the bottomhole drawdown/buildup history measured during the Reservoir Limits Test of Sand Zone No. 8. Wellhead pressure data measured during the long-term production testing of Sand Zone No. 8 have been employed to estimate the corresponding downhole pressures. The simulation model based solely on the Reservoir Limits Test is found to be in remarkably good agreement with the estimated bottomhole pressures for the first six months of production testing, but enlargement of the reservoir volume, by moving the boundary most remote from the well outward, is required to adequately match the full production history. The added remote volume corresponds to an increase by a factor of three in the estimated reservoir volume. The results for the Gladys McCall well are discussed in the context of earlier results determined from testing the other through geopressured geothermal design wells (Pleasant Bayou No. 2, Amoco Fee No. 1 and L.R. Sweezy No. 1 Well). 12 refs., 36 figs., 7 tabs.

30600 **(EGG-ELS—6845) Physical model studies of dispersion in fracture systems.** Hull, L.C. (EG and G Idaho, Inc., Idaho Falls (USA)). Apr 1985. Contract AC07-76ID01570. 84p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85011677.

The purposes of the laboratory-scale fracture network experiments are to study mechanisms controlling solute transport under conditions of known fracture parameters, to evaluate injection-backflow test procedures under conditions of known reservoir parameters, and to acquire data for validation of numerical models. Validation of computer codes against laboratory data collected under controlled conditions provides reassurance that the codes deal with important processes in a realistic manner. Preliminary simulations of the dual-permeability physical model have been made using the FRACSL reservoir code. These simulations permit locating electrodes and piezometers in the most advantageous positions to record tracer migration and pressure response. Much of the physical modeling effort this year was oriented towards validating the particle tracking algorithm used in FRACSL, and developing a better theoretical understanding of transport processes in fractures. Experiments were conducted in single fractures and single fracture junctions, and data on tracer migration collected. The Prickett, Naymik, and Lonnquist Random Walk aquifer simulation program has been modfied to simulate flow in single fractures. The particle tracking algorithm was also used to simulate infinite parallel plates under conditions where analytical solutions to the transport equation could be derived. The first case is for zero diffusion in the fracture, and transport based on a parabolic velocity profile. The second case is for diffusion homogenizing the tracer solution across the fracture. The particle tracking algorithm matched both analytical solutions quite well, with the same grid for both simulations. 48 refs., 41 figs., 2 tabs.

30601 **(SGP-TR—78) Experimental determination of the effective Taylor dispersivity in a fracture.** Gilardi, J.R. (Stanford Univ., CA (USA). Stanford Geothermal Program). Jun 1984. Contract AT03-80SF11459. 84p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85009922.

The applicability and accuracy of the approximation for Taylor Dispersion was experimentally determined for the diffusion of a chemical tracer in flow through a fracture. 12 refs., 16 figs., 10 tabs. (ACR)

30602 **(SGP-TR—80) Depletion modeling of liquid dominated geothermal reservoirs.** Olsen, G. (Stanford Univ., CA (USA). Stanford Geothermal Program). Jun 1984. Contract AT03-80SF11459. 144p. NTIS, PC A07/MF A01; 1; GPO Dep. File Number DE85009923.

Depletion models for liquid-dominated geothermal reservoirs are derived and presented. The depletion models are divided into two categories: confined and unconfined. For both cases depletion models with no recharge (or influx), and depletion models including recharge, are used to match field data from the Svartsengi high temperature geothermal field in Iceland. The influx models included with the mass and energy balances are adopted from the petroleum engineering literature. The match to production data from Svartsengi is improved when influx was included. The Schilthuis steady-state influx gives a satisfactory match. The finite aquifer method of Fetkovitch, and the unsteady state method of Hurst gave reasonable answers, but not as good. The best match is obtained using Hurst simplified solution when $\lambda = 1.3 \times 10^{-4}\ m^{-1}$. From the match the cross-sectional area of the aquifer was calculated as 3.6 km^2. The drawdown was predicted using the Hurst simplified method, and compared with predicted drawdown from a boiling model and an empirical log-log model. A large difference between the models was obtained. The predicted drawdown using the Hurst simplified method falls between the other two. Injection has been considered by defining the net rate as being the production rate minus the injection rate. No thermal of transient effects were taken into account. Prediction using three different net rates shows that the pressure can be maintained using the Hurst simplified method if there is significant fluid reinjection. 32 refs., 44 figs., 2 tabs.

30603 **(SGP-TR—81) Tracer test analysis of the Klamath Falls geothermal resource: a comparison of models.** Johnson, S.E. (Stanford Univ., CA (USA). Stanford Geothermal Program). Jun 1984. Contract AT03-80SF11459. 116p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85009924.

Two tracer tests on doublet systems in a fractured geothermal system were carried out in Klamath Falls, Oregon. The purpose of the tests were to obtain data which would lead to information about the reservoir and to test the applicability of current tracer flow models. The results show rapid breakthrough times and indicate fracture flow with vigorous mixing of injector fluid before production of same. This leads to the idea that thermal breakthrough is not directly related to tracer breakthrough in the Klamath Union doublet system. There has been no long-term enthalpy loss from exploiting the resource for 40 years. In order to reduce the data, models were developed to analyze the results. Along with a porous media flow model two mathematical models developed to analyze fractured geothermal systems are used to help decipher the various tracer return curves. The flow of tracers in doublet systems was investigated. A mathematical description is used for tracer flow through fractures as a function of time and various nonlinear parameters which can be found using a curve fitting technique. This allows the reservoir to be qualitatively defined. These models fit the data well, but point to the fact that future improvement needs to be considered for a clearer and more quantitative understanding of fractured geothermal systems. 22 refs., 32 figs., 11 tabs.

30604 **(SGP-TR—83) Linear boundary detection using pressure buildup tests.** Fox, G. (Stanford Univ., CA (USA). Stanford Geothermal Program). Jun 1984. Contract AT03-80SF11459. 48p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85009926.

Linear boundary detection has received considerable attention in the past. Although linear boundaries are frequently suspected and observed in well tests, conventional interpretation methods rely upon the development of two straight lines, which may not occur in practice. This report introduces two new semilog type curve matching methods for finding the distance to linear boundaries using buildup tests. Idealized curves are plotted from analytical solutions generated using the image well concept. These curves are then collapsed mathematically to a single type curve. By matching field data to the semilog type curve, the distance to a linear boundary may be estimated. The new methods have distinct advantages. The transition zone is the most important feature of the pressure response for type curve matching. Since development of the second straight line is not required, the range of interpretable tests is greatly extended. No estimates of reservoir characteristics are required to calculate the distance to the boundary because dimensionless parameters are used. 23 refs., 15 figs., 1 tab.

30605 (CONF-8410179—, pp 299-304) **Commercialization of geothermal energy: a new frontier.** Kerrigan, J.W. (Ultrasystems Inc., Irvine, CA). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

The application of geothermal energy has thus far been primarily limited to electrical power generation. The UltraSweet Project represents a bold step to apply current technology to a normal industrial manufacturing plant. Backed by the DOE, this project represents a major advance, involving a cooperative lender and imaginative developer. When successful, new industries can substantially impact the Imperial Valley. This project involves almost $90 million and will be the largest industrial plant in Imperial County.

30607 (SGP-TR—77) **Characterization of retention processes and their effect on the analysis of tracer tests in fractured reservoirs.** Walkup, G.W. Jr. (Stanford Univ., CA (USA). Stanford Geothermal Program). Jun 1984. Contract AT03-80SF11459. 107p. NTIS, PC A06. File Number DE85009921.

Retention processes such as adsorption and diffusion into an immobile region can effect tracer movement through a fractured reservoir. This study has conducted experimental work and has developed a two-dimensional model to characterize retention processes. A method to directly determine some important flow parameters, such as the fracture aperture, from the analysis of tracer tests has been developed as a result of the new two-dimensional model. The experimental work consisted of batch experiments designed to both reproduce earlier work and to determine the magnitude of the retention effects. Negligible retention was observed from which it was concluded that the batch experiments were not sensitive enough and that more sensitive flowing tests were needed. A two-dimensional model that represents a fractured medium by a mobile region, in which convention, diffusion, and adsorption are allowed, and an immobile region in which only diffusion and adsorption are allowed has been developed. It was possible to demonstrate how each of the mass-transfer processes included in the model affect tracer return curves by producing return curves for any set of the defining variables. Field data from the New Zealand was numerically fit with the model. The optimum values of the parameters determined from curve fitting provided a direct estimate of the fracture width and could be used to estimate other important flow parameters if experimentally determinable values were known. 25 refs., 22 figs., 6 tabs.

30608 **Prehnite - epidote equilibria and their petrologic applications.** Liou, J.G.; Kim, H.S.; Maruyama, S. (Stanford Univ., CA). *Journal of Petrology;* **24**: No. 4, 321-342(Nov 1983). Contract FC07-80ID12148.

The stability relations of prehnite and epidote were experimentally determined for the bulk composition of $Ca_2Al_2FeSi_3O_{12}(OH)$ + excess H_2O using conventional hydrothermal apparatus and solid oxygen buffer techniques. Three starting materials were used: (I) mixtures of natural prehnite and hematite, (II) mixtures of synthetic epidote and natural prehnite + hematite in subequal proportion; and (III) reground run products. Over a range of f/sub o_2/ , epidote was readily synthesized from starting material (I) at 500-550°C, 5-8 kb P/sub fluid/, run duration of 7 to 45 days, and prehnite grew at the expense of its high-T epidote assemblage at temperatures below 350°C, 2-8 kb, run duration of 20 to 50 days. Microprobe analyses indicate that the $Fe^{3+}/(Fe^{3+} + Al)$ ratios of synthetic epidotes and prehnites vary as a function of f/sub o_2/ and temperature. Both epidote and prehnite are most iron-rich at 325°C and 2 kb, 353°C and 5 kb and 373°C and 8 kb and f/sub o_2/ of the HM buffet. The phase relations of prehnite and epidote are defined by continuous reactions where a transition zone between the garnet-in reaction and the prehnite-out reaction occurs at 325-343°C, 2 kb, 353-375°C, 5 kb and 373-395°C, 8 kb P/sub fluid/ and f/sub o_2 of the HM buffer. The minimum stability for the garnet-bearing assemblages is defined by the garnet-in reaction, and the maximum stability for the prehnite-bearing assemblages by the prehnite-out reaction. Sliding equilibria involving phases with continuous change in composition apparently are common for low-grade metamorphism. 49 references, 9 figures, 7 tables.

30609 (EFN-LET—1983-02) **Cage rotor induction machine with controllable power factor.** Zweygbergk, S. von. (Energiforskningsnaemnden, Stockholm (Sweden)). 1983. 44p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85750829.

The machine can supply its own demands of reactive power. The need for condensers and/or phasecompensators can therby be eliminated or considerably reduced. This can be attractive if the machine is working as a generator in a wave converter, where distance to land often is considerable. Since the generator can work with a power factor almost equal to one, the consumption of copper for the transfer cable to land can be reduced quite essentially. This report presents briefly the basic principles of the SCIM-machine, covers derivation of the analytical expressions for the flux density in the airgap of the machine and gives the basis of calculation for the reactive power produced by the machine. In summing up, the following can be said about this new type of machine: a) It has been shown both analytically and experimentally that the machine can work with controllable power factor and under certain circumstances even supply the grid with reactive power. b) The machine is still at laboratory stage. The two test machines of conventional design which have been built, have been made by rewinding of conventional machines. Test results gained so far indicate that the aim to obtain a considerably improved power factor has been achieved in these machines, however at the expense of a somewhat lower efficiency. Since the mode of operation of the machine premises a certain discontinuity in the stator winding, it can be comprehended that the efficiency of such a machine always will be somewhat lower than in a conventional machine with about the same material. It is however possible that the improved power factor fully balances this drawback.

17 WIND ENERGY

30610 (STEV-TFS—83-8) **Renewable energy sources wind and solar energy in electrical energy systems. Development of methods.** Soeder, L. (Statens Energiverk, Stockholm (Sweden)). Aug 1983. 67p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750847.

This work describes the effects of adding the power output from energy sources which vary stochastically in time. Only wind power is treated, but the conclusions are relevant also for wave power and solar power. In the calculations, analytical methods have been used, i.e. wind data expressed as distributions or frequencies rather than time series, that are used in simulations.

30611 (STEV-VIND—84-3) **Gusts. Introductory statistical treatment.** Bergstroem, H. (Statens Energiverk, Stockholm (Sweden)). 1983. 23p. (In Swedish). NTIS (US Sales Only), PC A02/MF A01. File Number DE85750816.

Four measurements of one hour duration each of the atmospheric turbulence have been analysed. The amplitude of gusts has approximately gaussian distribution. Standard deviation of the amplitude of the difference of velocities is also a function of time differences. A gust with a large amplitude has also a long duration. Calculations are presented for the surpassing of certain amplitude limits for a predeterminated time. The distribution and spectra of wind velocity of the site should then be well documented.

30612 **(STEV-VIND—84-5) Wind variations on a long time scale at Naesudden.** Smedman, A.S. (Statens Energiverk, Stockholm (Sweden)). 1983. 15p. (In Swedish). NTIS (US Sales Only), PC A02/MF A01. File Number DE85750818.

The variations affect the power production and the routines of stop and go. The spectral gap could vanish and high turbulence will result. At stable layering, gravitational waves may cause sluggish variations. A comparison of normalized frequencies of the maximum and minima of wind velocity spectra at Naesudden and Marsta is presented.

30613 **(STEV-VIND—84-6) Wind-climatic study of profile measurements at Naesskaer.** Bergstroem, H. (Statens Energiverk, Stockholm (Sweden)). 1983. 19p. (In Swedish). NTIS (US Sales Only), PC A02/MF A01. File Number DE85750819.

Data from a 30 m mast have been used to calculate the wind profile at the height of 100 m by using a model theory of similarities. The medium wind velocity was calculated to be 9.2 m per s 100 m above the sea. The highest velocities exist during autumn and winter. The data are valid for the northwestern Baltic Sea, 10 km from the coast. Measurement from Gotland indicate that low-level jets at the height of between 100 m and 300 m are common phenomena at the Baltic Sea.

30614 **(STEV-VIND—84-18) Measurement of wind on high masts. Quarterly report 4/1983.** Kvick, T.; Andersson, H. (Statens Energiverk, Stockholm (Sweden)). Feb 1984. 33p. (In Swedish). (SMHI-MK—1984-7). NTIS (US Sales Only), PC A03/MF A01. File Number DE85750868.

The number of measuring stations has been reduced from April 1983 to 5 masts. Wind speed and wind direction is presented on graphs and tables.

1704 Economics

30615 (CONF-8102114—Summ., pp I.75-I.89) **Recommended procedure for a description of cost of energy from WECS. Preliminary proposal.** Nitteberg, J. (Institutt for Energiteknikk, Kjeller, Norway). Apr 1981. NTIS (US Sales Only), PC A05/MF A01. File Number DE85750807.

From IEA expert meeting on recommended practices for wind turbine performance testing; Geilo, Norway (19 Feb 1981).

In connection with the evaluation of energy costs, work on the IEA Energy Systems Analysis Project has given a systematic method of technical, economical and environmental characterization of energy technologies. This Standard Method of Technology Characterization (SMTC) agreed upon among experts of diverse professions from roughly 15 IEA member countries, made it possible to compare different technologies in a consistent way. In the following presentation, the SMTC will be outlined together with comments and advice on how it can be applied to wind energy and in particular on it's application to calculating the cost of wind energy. The EMTC is built up around a Standard Table of Characteristics (STC) containing well defined technical, economical and environmental parameters. Together with the STC there is also - A general description of the technological process and system. - A list of comments to the data given in the STC. The idea is that the inclusion of these three items should give sufficient information for the user to find out how the data is derived and from where it had its origin.

1705 Environmental Aspects

30616 **(NE-VIND—83-18) Ecological effects caused by wind power situated at sea. A summary.** Grimaas, U. (Naemnden foer Energiproduktionsforskning, Stockholm (Sweden)). 1983. 14p. (In Swedish). NTIS (US Sales Only), PC A02/MF A01. File Number DE85750827.

The effects may come into existence both during constructional activities and at normal operation. These shallow sea areas which may be exploited should become full of changes. The disturbance of the playground for fish and of fishing is discussed. It might be interesting to learn how fish and seals conceive sound and make use of it. Seals seem to avoid the coast where wind power has been established. The migration of birds should be observed. Comparative evaluations of regions become great interest.

30617 **(RISO-M—2449) Retrospective glance of a boundary layer wind tunnel experiment 25 years ago.** Petersen, H. (Risoe National Lab., Roskilde (Denmark)). Jul 1984. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85750796.

This report is a reprint of the contents of the paper "A type of wind tunnel for simulating phenomena in the natural wind", AGARD-report No. 308, 1960, and is issued on the occasion of the 25th anniversary of the experiments described. They were the first experiments in Denmark that modelled part of a town, Copenhagen, in a boundary layer wind tunnel designed for that specific task with the aim of investigating the distribution over the city of the emmission from a high factory chimney stack. At the time, 1959, the common interest in environmental problems was not very pronounced. However, the TUBORG brewery insisted on documentation for the selection of the height of a new chimney stack at the factory, sufficiently high to avoid causing any nuisance to the population in the surroundings, and so took the initiative of having the experiments realized.

30618 **(CONF-8102114—Summ.) Summary report from the IEA expert meeting on recommended practices for wind turbine performance testing.** Frandsen, S. (ed.). (Risoe National Lab., Roskilde (Denmark)). Apr 1981. 99p. NTIS (US Sales Only), PC A05/MF A01. File Number DE85750807.

From IEA expert meeting on recommended practices for wind turbine performance testing; Geilo, Norway (19 Feb 1981).

The report from IEA expert meeting contains 3 papers on proposals for recommended procedures for wind turbine performance testing, including cost of energy from wind turbines.

30619 (CONF-8102114—Summ., pp I.11-I.46) **Interim international recommended procedures for Wind Energy Conversion Systems performance testing.** Trenka, A.R. (Test Operations, Wind Systems Branch, Rockwell International, Golden, Colorado, USA). Apr 1981. NTIS (US Sales Only), PC A05/MF A01. File Number DE85750807.

From IEA expert meeting on recommended practices for wind turbine performance testing; Geilo, Norway (19 Feb 1981).

This document describes a proposed interim procedure for determining and reporting certain of the above described performance characteristics of Wind Energy Conversion Systems (WECS). It provides the consumer/purchaser with an equitable basis for comparing the energy production characteristics of WECS available in the marketplace. 1) The methods are not limited to WECS that produce electricity. 2) These procedures and practices are generally applicable to WECS of all sizes and classifications. 3) Specific procedures and presented for each step in the rating process. Alternate procedures, however, are allowed where indicated if documentation demonstrating their equivalence is provided. 4) This document does not address issues of safety reliability, durability, economics, noise or electromagnetic interference. These will be addressed in separate documents.

30620 (CONF-8102114—Summ., pp I.47-I.73) **Recommended practices for wind turbine performance testing. Preliminary proposals for sub-section on wind speed/power measurements.** Frandsen, S. (Risoe National Laboratory, Roskilde, Denmark); Maribo Pedersen, B. (Technical University of Denmark, Lyngby, Denmark). Apr 1981. NTIS (US Sales Only), PC A05/MF A01. File Number DE85750807.

From IEA expert meeting on recommended practices for wind turbine performance testing; Geilo, Norway (19 Feb 1981).

In the present paper some proposals as to the contents of the "recommended practices" are put forward. The paper shall be considered as a first draft, incomplete in many places, but hopefully sufficient as a basis for detailed discussions. The present proposals consider primarily long term measurements, which should give the most accurate information for the above-mentioned users. Additional recommendations, when making short term measurements, are thus left out for the present. What is discussed are the methods to be used in determining - the power curve of a wind turbine. - the mean power output or annual energy production. - the percentage of time in which the turbine is operating or the power duration curve.

30621 (DOE/NASA/20320—64) Effect of precipitation on wind turbine performance. [Final report]. Corrigan, R.D.; DeMiglio, R.D. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center; Sverdrup, Inc., Middleburg Heights, OH (USA)). May 1985. Contract AI01-76ET20320. 21p. (NASA-TM—86986). NTIS, PC A02/MF A01; GPO Dep. File Number DE85013105.

During performance testing on the NASA/DOE Mod-0 100 kW wind turbine, a decrease in rotor power was noted during adverse weather conditions (rain, snow, etc.). A review of the test results indicated this decrease could be attributed to the effects of precipitation on the rotor. Because the decrease in performance was significant, additional tests were run to measure and compare the rotor power with and without precipitation. This report presents both the experimental and analytical analysis of the effects of precipitation on wind turbine performance. The tests were conducted on the two-bladed Mod-0 horizontal-axis wind turbine with three different rotor configurations. Experimental data from these tests are presented which indicate that rainfall degraded the performance of all three rotors. Light rainfall degraded performance by as much as 20 percent at higher windspeeds while heavy rainfall degraded performance by as much as 30 percent. Snow mixed with drizzle degraded performance by as much as 36 percent at low windspeeds. The theoretical analysis which was used to predict the effect of rain on wind turbine performance was based on a blade-element/momentum code with airfoil characteristics modified to account for the effect of rain. The predictions were made for one of the three rotor configurations tested and indicated a loss in performance of 31 percent at high windspeeds with moderate rainfall rates. These predicted results agreed well with experimental data.

30622 (DOE/R0/00451—T1) [Wind turbine]. Final technical report. (Blind Canyon Aquaranch, Hagerman, ID (USA)). [1985]. Contract FG48-80R000451. 84p. NTIS, PC A05. File Number DE85011336.

The development and testing of a wind turbine is reported in this paper. The designs and materials used to manufacture the wind turbine are engineered to produce a machine which is relatively inexpensive and easily manufactured.

30623 (DOE/R1/23278—T1) Design of a unique wind powered heating system. Cromack, D.; Po, M.A. (Massachusetts Univ., Amherst (USA). Dept. of Mechanical Engineering). 1982. Contract FG41-81R123278. 22p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85013350.

The design of an entire wind turbine system utilizing a mechanical churn as the sole means of energy conversion has been completed. The system has been designed to meet the hot water demands of a 100 cow dairy farm which consumes 68,500 kW-hrs of energy yearly in the form of hot water. The hot water produced by this system will be used to provide space heating, livestock facility and milk processing equipment sanitation, and hot tap water. The wind turbine is designed for a moderate average wind speed of 6 m/s. It should be noted that this system could be used for other industrial applications where the energy demand for process hot water is similar to that of the dairy farm.

30624 (DOE/R3/06112—T1) Sailmill water pump. Quarterly and final report. Dorr, R. (Dorr (Ralph), Danville, VA (USA)). 24 Sep 1980. Contract FG43-79R306112. 51p. NTIS, PC A04. File Number DE85008993.

The design, construction and testing of a sailmill water pump are presented. Two different sailmills were designed and built with interchangeable components. The original model (Sailmill I) has rotating crankshafts with sails fixed at one end, while the Sailmill II employs a fixed crankshaft with rotating sails. Both models were tested in the North Carolina State flume and in a plywood flume built in a creek. Results of the tests are provided and show that neither sailmill could meet the desired effect of pumping 50,000 gallons of water a day to a height of 25 feet. The design plans and sketches for the construction of the sailmills are included in the report. (BCS)

30625 (EPRI-AP—4060-Vol.1) Goodnoe Hills Mod-2 Cluster Test Program. Volume 1. Energy production performance, availability, and reliability. Final report. Bovarnick, M.L.; Nielson, R.L.; Poore, R.Z.; Wiesner, W. (Boeing Aerospace Co., Seattle, WA (USA)). May 1985. 137p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920159.

The cluster of three Mod-2 wind turbines was installed at Goodnoe Hills, Washington, in 1980 and 1981. The machines were built for the US Department of Energy by Boeing and were formally accepted by the government in 1982. Electric Power Research Institute (EPRI) contracted with Boeing in November 1982 to conduct several tests and analyses as a part of its comprehensive evaluation of wind turbines. This document is one of three volumes that constitute the final report of this effort. Volume 1 addresses energy capture performance predictions, in-line performance degradation, performance evaluation methods, and 1982 component reliability evaluation.

30626 (EPRI-AP—4060-Vol.2) Goodnoe Hills Mod-2 cluster test program. Volume 2. Structural and mechanical loads tests and analyses. Final report. Bovarnick, M.L.; Shipley, S.A.; Finger, R.W. (Boeing Aerospace Co., Seattle, WA (USA)). May 1985. 144p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920198.

Boeing, under contract to the Electric Power Research Institute (EPRI), has completed a test and analysis program on the Mod-2 wind turbines at Goodnoe Hills, Washington. The goal was to make a structural and mechanical assessment of the machines. This was accomplished by updating the loads data base and determining the effects of site and machine differences and vortex generators on fatigue life estimates. Two yaw loads alleviation techniques were also evaluated. This report briefly describes the test setup and loads instrumentation, but it emphasizes the loads data comparisons and their relevance to Mod-2 fatigue life estimates. Comparisons of these data with dynamic loads data from a similar test program on the Pacific Gas and Electric Company (PG and E) Mod-2 wind turbine in Solano County, California, are included to illustrate site differences. Pretest predictions based on the DYLOSAT computer program are shown. Mean and fatigue load spectra in the form of wind bin plots are developed for the major structural components to compare data. The report concludes with an assessment of the importance of vortex generators, site dependence, and machine differences on fatigue load and life predictions. The adequacy of structural analysis methodology used on Mod-2 is evaluated, and recommendations are made to improve this methodology for application to horizontal-axis wind turbine design.

30627 (FRNC-TH—1914) Study of the performance of a wind mill in presence of a wind gradient. Zahran, M. (Toulouse-3 Univ., 31 (France)). 1982. 317p. (In French). NTIS (US Sales Only), PC A14/MF A01. File Number DE85751586.

The different aspects of the operation of wind-powered motors of large diameter have been analyzed. A parametric study of the wind-powered motor is then developed: influence of wedging, operating relation, mean and geometry of the blade. The influence of the wind gradient on performance is studied. A mathematical model enabling a detailed description of the shape of the wake is described and the induced velocities of the rotor plane at infinity are calculated. An experimental study of the velocity distribution in a meridian plane downstream of the rotor, with and without wind gradient is finally presented.

30628 (N—85-16301) Development of large wind energy power generation system. (National Aeronautics and Space Administration, Washington, DC (USA)). Jan 1985. 20p. (NASA-TM—77779). NTIS, PC A02/MF A01.

The background and development of an experimental 100 kW wind-energy generation system are described, and the results of current field tests are presented. The experimental wind turbine is a two-bladed down-wind horizontal axis propeller type with a 29.4 m diameter rotor and a tower 28 m in height. The plant was completed in March, 1983, and has been undergoing trouble-free tests since then. The present program calls for field tests during two years from fiscal 1983 to 1984. The development of technologies relating to the linkage and operation of wind-energy power generation system networks is planned along with the acquisition of basic data for the development of a large-scale wind energy power generation system.

30629 (NE-VIND—83-22) **Comparative stability analysis of the blade curve of single and double-blade vertical axis turbines, respectively.** Thor, S.E.; Dahlberg, J.Aa. (Naemnden foer Energiproduktionsforskning, Stockholm (Sweden)). 1983. 51p. (In Swedish). (FFA-TN—1983-22). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750828.

The radius of the turbine is 62.5 m. The calculations by the computer code STAGS show that the double blade turbine becomes unstable at load factors which are 30 percent higher than the corresponding values of a single-blade turbine. The blades are assumed to stand still and the blowing is directed towards the rotating axis. The wind load on the double-blade is assumed to be half of the single blade. Large deformations originate from the load pressure. A list of FFA reports on wind energy is presented.

30630 (PB—85-157527/XAB) **Meteorological and performance measurements on a 55-kW Vestas and a 30-kW Sonebjerg wind-turbine EC Wind Energy Programme, Action 5.** Jensen, S.A.; Bjerregaard, E.T.D.; Paulsen, U.S. (Commission of the European Communities, Luxembourg). [1985]. 83p. (EUR—9041-EN). NTIS, PC E05/MF E05.

A data-recording system was designed for measurements of meteorological data and data concerning the performance of a wind turbine. Measurements were carried out on two commercially available Danish wind turbines: a 55-kW Vestas wind turbine and a 30-kW Sonebjerg wind turbine. The test periods of the two wind turbines were approximately three months and two months, respectively. The same measuring program was carried out on both wind turbines, and consisted of: long-term measurements for the determination of wind statistics, power performance, and operation time; short-term measurements for the determination of power quality, skew wind, and brake functions; and, finally, supervision measurements in order to record the behaviour of the wind turbine during possible emergency situation.

30631 (RISO-M—2407) **Test report for Wind-Matic 14S, 55 kW. Standard measurements.** Lading, P. (Risoe National Lab., Roskilde (Denmark)). Mar 1984. 53p. (In Danish). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750794.

The report contains measurements carried out using the standard test procedure. The main results are dealing with: Power curves, system efficiency, annual energy production, power regulation by stall, mechanical brake, air-brakes and loads during cut-in. Full range measurements have been done for one rotor speed, some measurements have been done for lower rotor speed, compleated with calculations.

30632 (SERI/STR—217-2584) **Addendum to a catalog of low Reynolds number airfoil data for wind turbine applications.** Miley, S.J. (Texas A and M Univ., College Station (USA). Dept. of Aerospace Engineering). Feb 1985. Contract AC02-83CH10093. 87p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85008784.

The prediction of wind turbine performance requires airfoil data at Reynolds numbers lower than those used for aircraft operation. A Catalog of Low Reynolds Number Airfoil Data for Wind Turbine Applications, published in 1982 by Rockwell International Corporation, included airfoil data up to a Reynolds number of 3,000,000. After the catalog was finished, it was brought to the author's attention that the cubic spline fitting routine used in generating the curves from discrete data caused inaccuracies in some of the airfoils. A point-to-point curve fitting routing produced more accurate results. This addendum corrects the daag data for the affected airfoils, and is formatted to correlate with the original catalog.

30633 (SERI/STR—217-2629) **Development of an analytical model and code for the flapping response of a Hawte rotor blade.** Thresher, R.W.; Hershberg, E.L. (Oregon State Univ., Corvallis (USA). Dept. of Mechanical Engineering). Feb 1985. Contract AC02-83CH10093. 233p. NTIS, PC A11/MF A01; 1; GPO Dep. File Number DE85008806.

The following report is a descriptive summary of the work performed under RFP 76824 for Rockwell International's Rocky Flats, Colorado, facility as part of the Federal Wind Energy Research Program. The objectives of this project were threefold: (1) development of an analytical model of the flapping response of a wind turbine rotor; (2) development of an interactive, user-friendly computer code for performing the flapping analysis and for computing the rotor loads due to aerodynamic factors and blade flapping responses; and (3) verification of the model and the computer code with measured loads data taken from an existing machine. The model is a single-degree-of-freedom flapping response model of an individual wind turbine blade. It accounts for the blade bending deformation about the smallest blade inertia axis. The rotor is assumed to rotate at a constant speed, but the hub is allowed to move in a prescribed yawing motion. Rotors that are tilted and yawed relative to the mean wind direction can be accommodated in a straightforward manner.

30634 (STEV-VIND—83-25) **Analysis of the control problem for horizontal axis wind turbines. Final report.** Mattsson, S.E. (Statens Energiverk, Stockholm (Sweden)). Aug 1983. 52p. NT S Sales Only), PC A04/MF A01. File Number DE85750815.

This report considers control of large horizontal axis wind power plants connected to utility grids. The objective is to give a global picture of the control problem. The system dynamics and the characteristics are investigated first to find which properties that are basic to all horizontal axis wind turbines and which properties that can be influenced by process design and regulator design. Control objectives, measurements and other control issues are then discussed. The interaction between process design and regulator design is also discussed.

30635 (STEV-VIND—84-4) **Turbulence structure at prototype sites - a summary of the analysed data till now.** Smedman, A.S. (Statens Energiverk, Stockholm (Sweden)). 1983. 32p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. File Number DE85750817.

Some of characteristic features of the turbulence structure at the sites Maglarp and Naesudden are summarized. At Naesuuden the normalized spectral curves for the u, v and w components, given for uniform terrain, are valid at lower heights except for the low frequency part of the curves. At this region the spectral lag effect is noticeable. At heights over 100 m, when the wind is blowing from the colder sea, the stratification is very stable and the flow is only occasionally turbulent. At heights between 10-100 m the conditions are very variable and normalized spectral curves have their universal form but are displaced towards higher frequencies. At Maglarp the tower is situated at the top of a low and gently sloping hill. The velocity spectra can be analysed in terms of current flow over hill theory. When normalized spectra are compared with spectral curve valid for flat and homogenous terrain the following can be stated: All measured spectra have the same universal form. Spectra are displaced towards higher frequencies. Spectra higher up in the outer region contain much more energy than corresponding spectra for an ideal site.

30636 (STEV-VIND—84-7) **Flow characteristics above a very low and gently sloping hill.** Smedman, A.S.; Bergstroem, H. (Statens Energiverk, Stockholm (Sweden)). 1984. 26p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85750820.

Tower measurements of wind and turbulence in near neutral conditions at the top of a very low and gently sloping hill (height ca 20 m, with a length scale ca 1000 m) are analysed in terms of current flow over hill theory. Measurements of wind maximum height and the change of the variances of the three wind components from the inner to the outer region are found to be in agreement with predictions from the theory. Spectra of the longitudinal and vertical wind components in the inner region, come close to the corresponding Kansas curves in the high frequency range. They have higher energy in the low frequency region, probably a spectral lag effect caused by rougher upwind terrain. In the outer region the spectra coincide with the" corresponding Kansas curves if normalized by their respective variances and plotted against frequency ratio.

30637 **(STEV-VIND—84-8) Some observations of turbulence structure near a wooded coast line.** Smedman, A.S. (Statens Energiverk, Stockholm (Sweden)). 1983. 21p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85750821.

At the wind energy test site Kalkugnen, in Sweden, profile measurements together with turbulence measurement have been carried out during three years. The site is situated in complex terrain. The ground is sloping and the surface roughness varies between sea surface - rough open country - dense pine wood. In spite of this complexity an attempt is made to analyse wind profiles and velocity spectra in terms of a combination of flow over hill theory and flow over changing roughness.

30638 **(STEV-VIND—84-9) Sequential switching of a three-phase asynchronous wind generator onto the grid.** Zweygbergk, S. von. (Statens Energiverk, Stockholm (Sweden)). Dec 1983. 21p. (In Swedish). NTIS (US Sales Only), PC A02/MF A01. File Number DE85750822.

It has been shown that it could be possible to reduce the current of switching-on from 11.5 units to 4.5. The electrodynamic moment is also reduced. The calculation has been performed by means of Laplace Transformation.

30639 **(STEV-VIND—84-10) Investigation of the characteristics of the autosynchronous generator as a wind generator.** Briozzo, C.; Gutierrez, R.; Zweygbergk, S. von. (Statens Energiverk, Stockholm (Sweden)). Dec 1983. 81p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. File Number DE85750823.

The autosynchronous motor is similar to the asynchronous motor with a slide ring and it functions as a synchronous motor when its rotor is fed by direct current. An autosynchronous generator can work synchronously at high wind densities. On heavy flaws the machine is switched over to asynchronous mode. Three types of rotor circuits have been investigated, namely the Y-type, the conventional V-type and a V-type with damping. The extracted power was 75 percent to 85 percent of the labelled power. Calculations show that the transition from synchronous to asynchronous operation does not stress the rotor circuits. V-type with damping will permit a somewhat higher power outlet.

30640 **(STEV-VIND—84-11) Preliminary analysis of turbulence measurements at Naesudden during October 1980 and October 1982.** Hoegstroem, U. (Statens Energiverk, Stockholm (Sweden)). 1984. 29p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. File Number DE85750824.

Turbulence measurements and wind measurements performed during two autumn campaigns in 1980 and 1982 at the Naesudden peninsula WECS site have been analysed. The turbulence measurements have been taken at three levels in the 145 m mast: 11 m, 77 m and 134 m. To a large extent near neutral stratification prevailed in both measurement campaigns. Because of this the influence of terrain inhomogeniety (i.e. the presence of an extended wooded area at 1 to 2 km distance in one direction and of surrounding water areas at a similar distance for a large sector) on turbulence and can be studied in some detail. It is found that entirely undisturbed conditions prevail only for a rather narrow sector of northerly winds. For winds from most other sectors studied a moderate influence of terrain inhomogeniety is noticed in the studied turbulence quantities at 77 and 134 m. Highly anomalous conditions are found during an extended period (the measurement covered two days) in 1980 when the wind reaching the peninsula had an undisturbed over water fetch of several hundred kilometers: The wind profile was characterized by a maximum at 75-100 m above the surface. This feature was temporarily destroyed for a period of several hours when the wind turned less than 30 degrees to a direction where the flow had to pass a narrow strip of la (a few kilometers). The possible mechanism for this low level jet is discussed. It is suggested that frictional decoupling at the upwind coastline (some hundred kilometers away) may cause an inertial oscillation. It is, however, not clear at this stage whether such a phenomenon can survive travel for several hours in neutrally stratified air as prevailed in this stage.

30641 **(STEV-VIND—84-12) Turbulent characteristics of a shallow convective internal boundary layer.** Smedman, A.S.; Hoegstroem, U. (Statens Energiverk, Stockholm (Sweden)). 1984. 19p. Statens Energiverk, Stockholm, Sweden. File Number TI85750825.

Published in Boundary-Layer Meteorology. 25:271-287.

Turbulent characteristics of a 50 to 100 m deep convective internal layer (I.B.L.) have been studied. The data were gathered at a flat coastal site (Naesudden on the island of Gotland, Sweden) during three consecutive days in May 1980 which were characterized by a steady, very stable stratified marine approach flow. The site is situated on a flat area ca. 1500 m from the shoreline. Only daytime runs have been analysed in the present paper. The sensible heat flux at the ground was typically 200 W m^{-2} and was found to decrease more or less linearly with throughout the I.B.L., being slightly negative at greater height. The momentum flux was also found to decrease with height, but nevertheless shear production of turbulent kinetic energy was found to be large throughout the entire I.B.L. The analyses shows that the turbulent regime has a mixed character. Certain characteristics, such as the rate of growth of the I.B.L., appear to be almost entirely controlled by mechanical turbulence. Other turbulent characteristics, such as spectra of the horizontel wind components measured near the top of the I.B.L. tend to adhere to mixed-layer scaling in the high frequency range, exhiting much increased energy in the lower (reduced) frequency range.

30642 **(STEV-VIND—84-13) Case study of a boundary layer wind regime in stably stratified air over the Baltic Sea.** Hoegstroem, U.; Alexandersson, H.; Bergstroem, H. (Statens Energiverk, Stockholm (Sweden)). 1984. 31p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85750826.

Detailed boundary layer measuements from a coastal site on the island of Gotland in the Baltic Sea carried out during a two-day period in spring 1980 characterized by very steady south-easterly synoptic flow of a warm air mass over a much colder water surface have been analysed. It is suggested that the very complex wind hodographs can be explained in terms of the combined action or two independent processes: a corner effect, causing a strong anticlockwise turning and increase of the wind during the late afternoon and the early night hours, and frictional decoupling at the Latvian coast zone, ca. 200 km upwind of the measurement site, causing a pronounced low level jet during late night and early morning hours ca. 200 m above ground. It is also suggested that this type of low level jet brought by frictional decoupling at a coast line might be a rather common phenomenon over the sea at some distance from the coast line itself.

30643 **(EPRI-EL—3983) Soil resistivity tests using modeling techniques. Final report.** Kasten, D.G.; Caldecott, R.; Mokhtarzadeh, A.; Minkara, S.; Chen, C. (Ohio State Univ., Columbus (USA). Dept. of Electrical Engineering). May 1985. 107p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920642.

Models of soil structure, used in the design of safe grounding grids for utility substations, require accurate information on the soil resistivity at the site. Small-scale tests on earth models in an electrolytic tank show that current field methods of measuring soil resistivity can provide the data needed to generate reliable models.

2001 Power Plants And Power Generation

REFER ALSO TO CITATION(S) 29720, 29722, 30198, 30766, 31828

30644 **(DOE/PC/70723—T2) Efficient power generation from high sulfur coal. Quarterly progress report for quarter ending March 31, 1985.** Knoke, G.S. (Flow Industries, Inc., Kent, WA (USA)). 17 May 1985. Contract FG22-84PC70723. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011920.

A numerical model of the coal-acid power plant cycle has been developed to allow sensitivity studies and preliminary optimization of the cycle. A numerical model has been prepared for each process step. The computer code has been designed to allow some flexibility for the process steps, both in terms of operating parameters and the selection of the process steps. An executive program is used to read the process definition file and to call subroutines which model individual process steps. A process stream is carried from step to step, and ancillary streams, heat flows, and power requirements are calculated. The process stream parameters are updated as appropriate after each process step.

30645 **(EPRI-CS—3844) Condenser procurement guidelines. Final report.** Impagliazzo, A.M. (Heat Transfer Consultants, Inc., Hingham, MA (USA)). May 1985. 123p. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303. File Number TI85920622.

Steam surface condensers have a major impact on power plant availability and efficiency. Since supplying condensers to the utility industry is a very competitive buisness, it is essential that all of the requirements, all of the operating and design conditions, and any off standard conditions which can affect the condenser design and performance be clearly communicated to potential suppliers. These requirements are officially transmitted via the Purchase Specification. This report is intended to provide guidance in the preparation of this document so that it will include all of the information needed by a competent specialist to design a condenser which will achieve the required performance in a reliable manner with minimum maintenance. A further objective is to provide guidelines which will permit the Purchaser to evaluate the diverse offerings of the various suppliers.

30646 **(EPRI-CS—3999-CCM-Vol.1) FEATURE: Finite-Element Analysis Tool for Utility Rotordynamic Evaluation. Volume 1. User's manual.** Lee, C.C.; Tecza, J.; Zorzi, E.S. (Mechanical Technology, Inc., Latham, NY (USA)). May 1985. 372p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920598.

The FEATURE computer program (an acronym for Finite-Element Analysis Tool for Utility Rotordynamic Evaluation) is a flexible, user-oriented tool for analysis of rotor-bearing systems. The program performs linear critical speed, damped response, and stability calculations for a wide range of rotor geometries, including multiple, concentric, counterrotating spools and large, multispan, rigidly coupled rotors. A finite-element formulation gives the program excellent numerical stability and the use of static substructuring greatly reduces run time.

30647 **(EPRI-CS—3999-CCM-Vol.2) FEATURE: Finite-Element Analysis Tool for Utility Rotordynamic Evaluation. Volume 2. FEATURE/COJOUR workshop notes.** Lee, C.C.; Tecza, J.; Zorzi, E.S. (Mechanical Technology, Inc., Latham, NY (USA)). May 1985. 328p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920645.

The FEATURE computer program (Finite-Element Analysis Tool for Utility Rotordynamic Evaluation) is a flexible, user-oriented tool for analysis of rotor-bearing systems. The program performs linear critical speed, damped response, and stability calculations for a wide range of rotor geometries, including multiple, concentric, counterrotating spools and large, multispan, rigidly coupled rotors. A finite-element formulation gives the program excellent numerical stability and the use of static substructuring greatly reduces run time. The COJOUR computer program is to provide a technically sound means for determining dynamic coefficients for use in the FEATURE code. It is capable of solving a wide variety of fluid film journal bearing configuration including both fixed-pad and tiling-pad types with or without thermal effects. The program will give comprehensive output such as load capacity, power loss, stiffness and dampling coefficients, etc.

30648 **(EPRI-CS—4014) 1983 fossil plant heat rate improvement workshop: proceedings.** Brown, R.G.; Quilliam, J.F.; Tome, A.E. (eds.). (Delian Corp., San Jose, CA (USA)). May 1985. 476p. (CONF-8309342—). Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920636.

From Fossil plant heat rate improvement workshop; St. Louis, MO, USA (20 Sep 1983).

An APRI sponsored workshop to address heat rate improvement of existing Fossil plants was hosted by Union Electric Company in Saint Louis, Missouri on September 20-22, 1983. This workshop was organized to provide a forum for representatives from several utilities to meet and address current key technical issues and problems associated with heat rate improvement. Another objective of this workshop was to provide utility input to EPRI project 1403-3, "Heat Rate Improvement of Existing Fossil Plants." The purpose of this project is to develop guidelines for utilities on the initiation and development of a heat rate improvement program. The workshop was attended by approximately 150 utility members representing 70 US and Canadian utilities. Formal presentations were given on several key topics of interest to utility personnel on heat rate improvement. Case studies describing important or unique utility experiences were presented. A presentation on EPRI research project 1403-3 discussed this project's objectives and provided a status report on the project activities. Copies of these papers are included in these proceedings. Working group discussion sessions were held on selected topics relevant to heat rate improvement to provide an opportunity for utility engineers to exchange ideas and information in a less formal environment. Summaries of these working group discussions are provided in these proceedings. In addition to the formal presentations and working group discussions, tutorials were given by recognized experts on topics of general interest and importance to utility engineers. Papers have been entered individually into EDB and ERA. (LTN)

30649 **(EPRI-EL—3918) Workshop proceedings: metering-type coupling capacitor voltage transformers (CCVTs).** (National Bureau of Standards, Washington, DC (USA)). Apr 1985. 290p. (CONF-8306269—). Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920603.

From Workshop on metering-type coupling capacitor voltage transformers (CCVTs); Gaithersburg, MD, USA (2 Jun 1983).

In the early 1970's there was a lot of concern in the utility industry over the reliability of coupling capacitor voltage transformers (CVVTs) for energy metering purposes. Because of this concern, a joint NBS-EPRI project was initiated in 1973 to develop a system that could be used to calibrate the CCVTs in situ. This work was completed in 1975. After that, NBS has used the system to perform calibrations upon request from utilities. A small data base related to CCVT performance has been collected by NBS but the data base is too small to allow any conclusions to be drawn about the reliability of CCVTs in general. A workshop involving people with experience in the design, manufacturing and usage of CCVTs was therefore organized by NBS and EPRI. This report covers the prepared presentations of the workshop participants and contains a record of the discussions taking place of the workshop.

30650 **(EPRI-NP—4056) Stress corrosion cracking in steam turbine disks: analysis of field and laboratory data. Final report.** Eason, E.D. (Failure Analysis Associates, Palo Alto, CA (USA)). May 1985. 94p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920660.

The field data and related laboratory data from many investigators were analyzed to identify the key variables and quantify their effects on stress corrosion cracking of turbine disks. Beginning with over 35 potential variables, pattern recognition and transformation analysis techniques were used to find and characterize the most important variables. The transformation analysis technique was also used to identify laboratory environments that are comparable to the field and to check for lab-to-lab differences in measured crack growth rate. Field data were also analyzed separately, using transformation analysis and order statistics to determine the effects of variables and produce statistical distributions of crack growth rate and failure rate with time. Models were constructed for the field and laboratory data to combine data from many sources and test conditions and to quantify the key variable effects. Two, three, and four variable models were calibrated to the available data. The four variable model is capable of correlating stress corrosion data for 19 low alloy steels with negligible increase in scatter compared to NiCrMoV data. The three variable model describes the behavior of disk steels in the field and comparable laboratory environments. 42 refs., 39 figs., 10 tabs.

30651 (EPRI-NP—4074M) Stress corrosion cracking and corrosion fatigue of steam turbine materials. Macdonald, D.D.; Szklarska-Smialowska, Z.; Moccari, A. (Ohio State Univ., Columbus (USA)). May 1985. 20p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920661.

A comprehensive study is reported on the stress corrosion cracking and corrosion fatigue behavior of Type 403SS turbine blade alloy and ASTM A-471 turbine disk steel in simulated low pressure steam turbine environments. The studies have been carried out using temperature, electrolyte type and concentration, loading wave form, R-ratio, potential, and metallurgical state of the steel as the principal experimental variables, with the ultimate goal in mind of identifying various mechanisms for crack propagation. Extensive electrochemical polarization studies are also reported and the results of this work have been used to characterize the corrosion and electrochemical state of any given alloy in an environment of interest. Some work is also reported on identifying potential inhibitors of stress corrosion cracking and corrosion fatigue in these steels in simulated low pressure steam turbine environments. A number of effective inhibitors have been identified. Finally, hydrogen permeation and trapping studies on ASTM A-471 were carried out to determine whether or not this steel is susceptible to hydrogen embrittlement or hydrogen-assisted crack propagation. These studies show that at ambient temperature, and to a lesser extent at elevated temperature (90°C), ASTM A-471 is susceptible to hydrogen-induced crack propagation in simulated low pressure steam turbine environments. 12 refs.

30652 (EUR—9271-DE) Utilization of industrial waste heat by ORC systems. Huppmann, G.; Weichselgartner, J.; Schmidt, G.; Dure, G.; Oechslein, W.; Raasch, E. (Commission of the European Communities, Luxembourg. Directorate-General for Information, Market and Innovation). 1984. 521p. (In German). Commission of the European Communities, Luxembourg. Office of Official Publications of the European Communities.

In this project the feasibility of the Organic Rankine Cycle Principle for waste heat recovery was investigated with an - in general - positive result. First of all the potential of waste heat in industry usable by ORCS was evaluated and the typical properties of ORCS usable heat sources were defined. In the second step we collected data about the working fluids, the expansion engines and the other components of a Rankine cycle. These data are presented in the final report so that potential users can design an ORCS for their heat sources, can evaluate the investment costs, the pay-back period and the rentability of his plant. A cost sensitivity study is given for seven ORC-plants differing in the temperature level, the working fluid, the efficiency and the energy recovering rate. The investment costs, the time of amortization and the rentability are compared. We projected ORC-plants for three typical applications in a few power output categories and evaluated the investment costs, the payback-periods and the rentabilities. The main result is that the less sophisticated plants get a higher benefit than plants with a high energetical efficiency. The results of our test programme are as follows: Screw expanders are usable up to about 100 kW for R114 with 5% lubricant; For higher temperatures turbines in connection with toluene get advantages, because the consequent separation between working fluid loop and lubricant loop is possible and for performances higher than 100 kW turbines for R114 and toluene are recommended.

30653 (FCR—6846) Advanced converter technology. Final report, May 23, 1979-December 31, 1984. Walton, J.W. (United Technologies Corp., South Windsor, CT (USA). Power Systems Div.). 1984. Contract AC01-79ET29079. 240p. NTIS, PC A11/MF A01; 1; GPO Dep. File Number DE85012502.

This report summarizes the results of a five year program to define an advanced power conditioner employing 1980's technology for use with multi-megawatt direct current power sources such as fuel cells, solar photovoltaics, and load-leveling batteries. The objective of this program is to define a multi-megawatt, grid-connected power conditioner which incorporates advanced components and systems technology to provide reduced cost and increased efficiency, reliability, and application flexibility. This overall objective is accomplished through the investigation of advanced power conditioner concepts, preparation of a preliminary design, and experimental verification of critical technical and operating features. The main emphasis is placed on power conditioners in the 5 to 10 MW range; a study of systems in the 0.5 to 5 MW range for use with solar photovoltaic sources is included. The major experimental efforts are: construction of a breadboard version of the logic and controls system; verification of the controls in converter system; and, construction and test of a 1.2-MW powerpole. The investigation is divided into the following categories: advanced system definition, improved switching circuits, improved magnetics, improved logic and controls, controls and system design confirmation, broader operating capability, interface definition and optimization, and solar application.

30654 (NP—5770191) Technological development and its impact on the future energy system. Appendix 1. Evaluation commissioned by the Danish Ministry of Energy. (Risoe National Lab., Roskilde (Denmark)). Jan 1984. 365p. (In Danish). NTIS (US Sales Only), PC A16/MF A01. File Number DE85770191.

30655 (PB—85-157675/XAB) Effective use of cooling lakes and cooling towers in hybrid cooling systems. Completion report, July 1983-August 1984. Sturm, T.W. (Georgia Inst. of Tech., Atlanta (USA). Environmental Resources Center). Aug 1984. 73p. (ERC—07-84). NTIS, PC A04/MF A01.

Prepared in cooperation with Georgia Inst. of Tech., Atlanta. School of Civil Engineering.

The research summarized in this report analyzes the consequences of the use of hybrid cooling systems for the dissipation of waste heat from thermoelectric power generation. The hybrid cooling system study consists of a combination of cooling towers and a cooling lake to receive a specified heat load. A transient computer simulation model of both the cooling lake stratification and the cooling tower thermodynamic performance is developed. The model is calibrated and verified with field data. Simulations of various combinations of cooling lake and cooling tower capacities for a given power plant heat load are conducted to determine the effect on lake thermal structure, total water loss by evaporation, and power plant intake temperatures.

30656 The role of MHD in the energy future. Dicks, J.B.; Bart, A.J.; Crawford, L.W. (University of Tennessee Space Institute, Tullahoma, TN). *Proceedings, Intersociety Energy Conversion Engineering Conference;* 3: 1453-1462(Aug 1984). (CONF-840804—).

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

This paper examines past MHD economic studies and compares results with current, more thorough, analyses using present value calculations. There is substantial agreement on cost per KWH within the range of options analyzed. More sophisticated financial analyses tools are used. A plant, in which the MHD process is combined with a downstream process producing synthetic fuel, is analyzed and compared with standard plants. The hybrid plant appears to have substantial economic advantages. MHD can probably produce electric power at 15 to 20 percent below conventional coal plants and competes well with advanced designed coal plants.

30657 (DOE-tr—273-Vol.1, pp IA1.1-IA1.8) **Results from comparative analysis of different magnetohydrodynamic generator and power train designs for early commercial power plant applications.** Hals, F.A.; Pian, C.C.P.; Sadovnik, I.; Stankevics, J.O. (Avco Everett Research Laboratory, Inc.). 1983. Translation source information not available . NTIS, PC A19/MF A01. Contract AC22-80ET15614.

From 8. international conference on MHD electrical power generation; Moscow, USSR (12 Sep 1983).

In Eighth International Conference on MHD Electrical Power Generation. Vol. 1.

This paper presents results from analyses of magnetohydrodynamic (MGD) power trains for commercial power plant applications. The analyses conducted were part of the first phase of a planned three phase program for the formulation of a Magnetohydrodynamic Advanced Power Train (APT) Development Program. Supersonic MHD generator channel operation at a peak magnetic field strength of 4.5 Tesla is attractive for early commercial MHD power generation. It offers substantial cost, saving and less risks for the magnet compared to subsonic channel operation at a peak magnetic field of 6 Tesla. The penalty in performance is relatively small and in the order of 10 to 15% less net MHD power produced or 0.5 to 1.0 percentage point less net overall plant efficiency. The part load performance characteristics of supersonic MHD generators are also attractive. Subsonic MHD generator channel operation at a higher field strength of 6 Tesla becomes more attractive as fuel cost increases because of its better performance and higher resulting net plant efficiency and as experience is gained with the construction and operation of large, high field strength MHD superconducting magnets. 11 refs., 2 figs., 5 tabs.

This document assesses the environmental impacts of the proposed 156-mile Buckley-Summer Lake 500-kV transmission line; the proposed Buckley Substation near Maupin, Oregon; and the proposed Summer Lake Substation near Silver Lake, Oregon.

30659 (PB—85-156271/XAB) **Evaluation of rural air-quality simulation models. Appendix g. Statistical tables for PPSP (Power Plant Siting Program).** Londergan, R.; Minott, D.; Wackter, D.; Kincaid, T.; Bonitata, D. (TRC Environmental Consultants, Inc., East Hartford, CT (USA)). Oct 1982. 36p. NTIS, PC A03/MF A01.

See also PB83-182758.

This report summarizes the results of a comprehensive evaluation of rural point-source air-quality simulation models using routinely collected data around the Clifty Creek power plant. The report contains numerous tabulations of each model's performance in terms of statistical measures of performance recommended by the American Meteorological Society. The purpose of the report is two-fold. First, it serves to document for the models considered, and similar models, their relative performance. Second, it provides the basis for a peer scientific review of the models. To stay within the spirit of this latter purpose, the report is limited to a factual presentation of information and performance statistics. No attempt is made to interpret the statistics or to provide direction to the reader, lest reviewers might be biased.

30660 (PB—85-173086/XAB) **Western Maryland power plant siting study: air-quality assessment of three candidate sites. Final report.** Weil, J.C.; Pierce, T.E.; Corio, L.A. (Martin Marietta Environmental Systems, Columbia, MD (USA)). Jan 1985. 119p. NTIS, PC A06/MF A01.

Prepared in cooperation with Martin Marietta Labs., Baltimore, MD. ;See also PB85-172948.

This report presents the detailed analyses of air-quality impacts related to three candidate sites under consideration in the Western Maryland Power Plant Siting Study. Both EPA-approved and state-of-the-art dispersion models were used to evaluate ground-level concentrations against NAAQS and PSD Class II limits for both flat and elevated terrain areas. Candidate areas are described and stack and fugitive emissions and plant operating parameters are provided. Local meteorological data are used to predict ground-level concentrations for primary stack pollutants, fugitive dust, and fluoride levels. Visibility degradation and cooling-tower moisture effects are also evaluated. PSD Class II limits for SO_2 could be met at all candidate sites based on state-of-the-art modeling. EPA-approved models indicate that both Washington County options could realize greater potential emissions than the Frederick County option. No difference is anticipated in visible cooling-tower plume frequency, salt deposition, or enhanced icing.

30661 (PB—85-173276/XAB) **Western Maryland power plant siting study: biological characterization of candidate sites. Final assessment. Final report.** Jacobs, F.; Himel, J.; Cummins, R.; Weisberg, S. (Martin Marietta Environmental Systems, Columbia, MD (USA)). Oct 1984. 181p. NTIS, PC A09.

See also PB85-173516; Portions of this document are not fully legible.

Three locations in western Maryland are being considered as potential candidate sites for future construction of a 1200-1800 MWe coal-fired power plant. This report provides a detailed biological characterization of each site and assesses potential terrestrial and aquatic impacts associated with plant construction and operation. This assessment considers possible impacts on geomorphology, vegetation, wildlife, water quality, and nearby aquatic biota. Relevant information contained in a Phase I document produced earlier under this contract, was incorporated into this final report.

30662 (PB—85-173482/XAB) **Western Maryland power-plant siting study: socio-economic impact assessment of three candidate sites. Final report.** (Urban Systems Research and Engineering, Inc., Washington, DC (USA)). Jan 1985. 189p. NTIS, PC A09/MF A01.

See also PB85-174779.

This report summarizes the socio-economic impacts that are expected to arise from the construction and operation of an 1890-MW conventional coal-fired power plant being evaluated at three candidate sites in Western Maryland. Three scenarios are evaluated: simultaneous construction (no staging) of three 630-MW units, 2-year staging of three 630-MW units, and 4-year staging of three 630-MW units. Economic profiles of Washington and Frederick counties, MD, are summarized in detail, and the related economic links with surrounding MD, PA, WV, and VA counties are described. Employment, income, population, housing, tax revenue, and government-expenditure impacts are summarized. Public service costs and transportation, land use, and visual-quality issues are also summarized. Traffic congestion is anticipated to be mostly felt close to the sites and is of a relatively short duration.

30663 (PB—85-173912/XAB) **Flue-gas conditioning. Final report, March 1979-March 1982.** Yung, S.C.; Patterson, R.G.; Hancock, B.L.; Calvert, S. (Air Pollution Technology, Inc., San Diego, CA (USA)). Feb 1985. 110p. NTIS, PC A06/MF A01.

The report gives results of a survey of available flue-gas conditioning agents and user experience. Many existing chemicals have been used as conditioning agents in power plants or have been studied in the laboratory as potential agents. The particle-collection efficiency of an electrostatic precipitator (ESP) for coal-fired power plant flue-gas cleaning depends on the electrical properties of the fly ash, among other things. Flue-gas conditioning refers to the addition of chemicals to the flue gas for modification of fly-ash properties and/or electrical conditions in the ESP to improve the collection efficiency of ESPs. Conditioning is usually used to upgrade existing ESPs.

30664 **(EPRI-EL—3974) Development of molded joints and terminals for 230-kV extruded cross-linked polyethylene (XLPE) insulated cable. Final report.** Bahder, G.; Bopp, L.A.; Eager, G.S. Jr.; Katz, C.; Knott, A.; Schmidt, G.A. (General Cable Co., Edison, NJ (USA)). Apr 1985. 32p. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303. File Number TI85920608.

The reliability of extruded-dielectric transmission systems depends to a great extent on the quality of joints and terminals. Detailed procedures developed in this study for field-molding high-stress 230-kV cable joints can ensure the stability of critical interfaces over many years.

30665 **(EPRI-EL—3977-Vol.1) Calculating ac/dc resistance ratios for high-pressure oil-filled cable Designs. Volume 1. Designer's guide. Final report.** Sosnowski, M.; Bahder, G.; Mekjian, A. (Cable Technology Labs., Inc., New Brunswick, NJ (USA)). Apr 1985. 52p. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303. File Number TI85920602.

Using electromatic field theory, a new method is developed for calculating alternating current in power cables installed in pipes of carbon steel (magnetic pipes). The technique for evaluating these losses is based on the method of images which replaces complicated distribution of currents in the system with a sequence of thin conductors. The method not only gives a mathematical framework for the solution of alternating current losses, but it also gives the underlying physical picture of effects contributing to these losses. Skin effect, proximity effect and losses due to the pipe are calculated separately. For the first time, the increase of losses in the conductors, when the cables are placed in a magetic pipe, are analyzed mathematically. Good agreement is obtained between the result of calculations and the experimentally determined ac-dc resistance ratios for pipe-type cables with concentric stranded copper conductors and also for cables with aluminum or copper segmental conductors when appropriate factors modifying conductor resistance to account for the effect of segmenting are introduced. Volume 1 of the report is the designer's guide containing all the formulas and tables necessary for performing the calculations while Volume 2 presents the theoretical background of the method.

30666 (NP—5770191, pp 3.1-3.29) **Power supply system. Some factors affecting the future production pattern.** Jan 1984. (In Danish). NTIS (US Sales Only), PC A16/MF A01.

EFP-81.

In Technological development and its impact on the future energy system. Appendix 1. Evaluation commissioned by the Danish Ministry of Energy.

The Danish electric power production is nowadays based on fossil fuel power plants. The future sources comprehend nuclear power and wind power, their contribution probably insignificant until the next century. Future technological problems of load control, long-distance power transmission and development of storage facilities for heat and electricity are briefly reviewed.

30667 **(SAND—84-2458C) Injector losses on Mite.** Woodall, H.N.; Stinnett, R.W. (Sandia National Labs., Albuquerque, NM (USA)). 1985. Contract AC04-76DP00789. 16p. (CONF-850616—4). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012356.

From 5. IEEE pulsed power conference; Washington, DC, USA (10 Jun 1985).

One of the most critical areas in a magnetically-insulated power feed is the injector section. In this portion of the feed, the electric field at the cathode becomes sufficient to cause cathode plasma formation and electron flow in the gap. We have used Faraday cups and filtered 4-chlorostyrene monitors to measure losses in this initial portion of the Mite (2 MV, 4.8 ohm) magnetically-insulated transmission line. Electron losses in the injector are measurable and last through most of the pulse. The propagation of the magnetic insulation wave through the injector region is slower in the injector region (~.4c) than in the rest of the line (~.6c). These experiments were performed using both carbon-coated and bead-blasted aluminum surfaces.

30668 **(CEA-CONF—7539) Simulators as safety analysis tool.** Peltier, J. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete). Mar 1984. 21p. (In French). (CONF-8403181—1; DAS—81). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751318.

From SFEN conference on simulator part in nuclear safety; Paris, France (20 Mar 1984).

This report shows the interest of a simulator in the safety analysis of a nuclear reactor. The SALAMANDRE simulator of the Institut de Protection et de surete Nucleaire (IPSN, Fontenay-aux-Roses, (France)) is presented very briefly.

30669 **(NUREG—0020-Vol.9-No.4) Licensed operating reactors. Status summary report, data as of March 31, 1985. Volume 9, No. 4 .** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Resource Management). Apr 1985. 450p. NTIS, PC A19/MF A01 - GPO. File Number TI85901532.

This report provides data on the operation of nuclear units as timely and accurately as possible. This information is collected by the Office of Resource Management, from the Headquarters' Staff of NRC's Office of Inspection and Enforcement, from NRC's Regional Offices, and from utilities. Since all of the data concerning operation of the units is provided by the utility operators less than two weeks after the end of the month, necessary corrections to published information are shown on the ERRATA page. This report is divided into three sections: the first contains monthly highlights and statistics for commercial operating units, and errata from previously reported data; the second is a compilation of detailed information on each unit, provided by NRC Regional Offices, IE Headquarters and the Utilities; and the third section is an appendix for miscellaneous information such as spent fuel storage capability, reactor years of experience and non-power reactors in the United States.

30670 **(BNL-NUREG—36144) Decontamination impacts on solidification.** Piciulo, P.L.; Davis, M.S. (Brookhaven National Lab., Upton, NY (USA)). 1985. Contract AC02-76CH00016. 17p. (CONF-850279—1). NTIS, PC A02/MF A01 - GPO. File Number TI85010545.

From Chemical decontamination on boiling water reactors; Charlotte, NC, USA (26 Feb 1985).

The increased occupational exposure resulting from the accumulation of activated corrosion products in the primary system of LWRs has led to the development of chemical methods to remove the contamination. In the past, the problem of enhanced migration of radionuclides away from trenches used to dispose of low-level radioactive waste, has been linked to the presence, at the disposal unit, of chelating or complexing agents such as those used in decontamination processes. These agents have further been found to reduce the normal sorptive capacity of soils for radionuclides. The degree to which these agents inhibit the normal sorptive processes is dependent on the type of complexing agent, the radionuclide of concern, the soil properties and whether the nuclide is present as a complex or is already sorbed to the soil. Since the quantity of reagent employed in a full system decontamination is large (200 to 25,000 kg), the potential for enhanced migration of radionuclides from a site used to dispose of the decontamination wastes should be addressed and guidelines established for the safe disposal of these wastes.

30671 **(DOE/ER/12075—4FR) Hydrodynamics of single- and two-phase flow in inclined rod arrays.** Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). 1984. Contract AC02-82ER12075. 416p. NTIS, PC A18/MF A01; 1; GPO Dep. File Number DE85012560.

Required inputs for thermal-hydraulic codes are constitutive relations for fluid-solid flow resistance, in single-phase flow, and interfacial momentum exchange (relative phase motion), in two-phase flow. An inclined rod array air-water experiment was constructed to study the hydrodynamics of multidimensional porous medium flow in rod arrays. Velocities, pressures, bubble distributions, and void fractions were measured in inline and rotational square rod arrays of P/d = 1.5, at 0, 30, 45, and 90 degree inclinations to the vertical flow direction. Constitutive models for single-phase flow resistance are reviewed, new comprehensive models developed, and an assessment with previously published and new data made. The principle of superimposing one-dimensional correlations proves successful for turbulent single-phase inclined flow. For bubbly two-phase yawed flow through incline rod arrays a new flow separation phenomena was observed and modeled. Bubbles of diameters significantly smaller than the rod diameter travel along the rod axis, while larger diameter bubbles move through the rod array gaps. The outcome is a flow separation not predictable with current interfacial momentum exchange models. This phenomenon was not observed in rotated square rod arrays. Current interfacial momentum exchange models were confirmed for this rod arrangement. Models for the two phase flow resistance multiplier for cross flow were reviewed and compared with data from cross and yawed flow rod arrays. Both drag and lift components of the multiplier were well predicted by the homogenous model. Other models reviewed overpredicted the data by a factor of two.

30672 **(DOE/ET/34031—18) BWR Fuel Bundle Extended Burnup Program. Final report.** Baumgartner, J.A. (comp.). (General Electric Co., San Jose, CA (USA). Nuclear Engineering Div.; Northern States Power Co., Minneapolis, MN (USA)). Dec 1984. Contract AC02-80ET34031. 98p. (GEAP—30846). NTIS (US Sales Only), PC A05/MF A01; 1; GPO Dep. File Number DE85009056.

This is the final report for the BWR Fuel Bundle Extended Burnup Program. The highest burnup fuel bundles in this program reached bundle averages of 45.6 GWd/MTU with measured peak pellet burnups of 58.7 GWd/MTU. Program results through 1983 are summarized, and the final Vallecitos Nuclear Center hot cell examination results are described in detail. The overall results obtained from thorough site examinations, and hot cell examinations and testing, confirm the good performance expectations at high burnup. Fuel bundles which are designed to adequately accommodate the differences in rod growth at high burnup will be capable of reliable operation to exposures at least as high as those attained in this program.

30673 **(DOE/NE/34130—1-Vol.1) Light water reactor fuel performance: proceedings. Volume 1.** (American Nuclear Society. Florida Section). Apr 1985. Contract AH01-85NE34130. 349p. (CONF-850401—Vol.1). NTIS (US Sales Only), PC A15/MF A01; 1; GPO Dep. File Number DE85010567.

From Topical meeting on light water reactor fuel performance; Orlando, FL, USA (21 Apr 1985).

Separate abstracts are presented for each of the papers concerning PWR type reactor and BWR type reactor fuel performance and the corrosion of Zircaloy fuel cans.

30674 **(DOE/NE/34130—1-Vol.2) Light water reactor fuel performance: proceedings. Volume 2.** (American Nuclear Society. Florida Section). Apr 1985. Contract AH01-85NE34130. 352p. (CONF-850401—Vol.2). NTIS (US Sales Only), PC A16/MF A01; 1; GPO Dep. File Number DE85011221.

From Topical meeting on light water reactor fuel performance; Orlando, FL, USA (21 Apr 1985).

Separate abstracts are presented for each of the papers presented concerning fission product behavior, burnable absorbers, ramping experience, and advanced fuel designs.

30675 **(DOE/OR/21400—T127) Light water reactor pressure vessel simulation (LWR-PVS) program.** Kam, F.B.K. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 53p. NTIS, PC A07/MF A01 - GPO. File Number TI85013046.

The LWR-PVS program has two major tasks; the first task is concerned primarily with well-defined reproducible benchmark experiments, and the second task deals with ASTM Standards activities. During this report period, the following work was accomplished: program documentation; Final Phase II and Preliminary Phase III calculations of the VENUS PWR Mockup Experiment; NESDIP transport calculations for the 0-cm, 20 cm, and 70-cm cavity configurations; Babcock & Wilcox (B & W) SDMF perturbation experiment; the fifth NRC HSST series of metallurgical irradiations; and ASTM standards activities.

30676 **(EGG-RST—6860) Technical evaluation report TMI action - NUREG-0737 (II.D.1) relief and safety valve testing for Clinton Power Station Unit 1. (Docket No. 50-461).** Burr, T.K.; Magleby, H.L. (EG and G Idaho, Inc., Idaho Falls (USA)). May 1985. Contract AC07-76ID01570. 19p. NTIS, PC A02/MF A01. File Number TI85012472.

Light water reactors operators have experienced a number of occurrences of improper performance by safety and relief valves installed in their primary coolant systems. Because of this, the authors of NUREG-0578 (TMI-2 Lessons Learned Task Force Status Report and Short-Term Recommendations) recommended that programs be developed and completed which would reevaluate the performance capabilities of BWR safety and relief valves. This report has examined the response of the Licensee for the Clinton Power Station, Unit 1 to the requirements of NUREG-0578 and subsequently NUREG-0737 and finds that the Licensee has provided an acceptable response, reconfirming that the General Design Criteria 14, 15 and 30 of Appendix A to 10 CFR-50 have been met.

30677 **(EPRI-NP—4010) Improvements to critical path time for BWR refueling outages. Final report.** Howard, N.C.; Johnson, K.R.; Kachel, P.F.; Karan, L.F.; Kowdley, B.S.; Patel, H.C.; Perry, D.R.; Punches, J.R.; Shira, M.L.; Stoll, B.G. (General Electric Co., San Jose, CA (USA). Nuclear Energy Business Operations). May 1985. 273p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920653.

A previous study performed by General Electric Company (GE), identified 23 improvements that could save critical path time during refueling outages in boiling water reactors (BWR). This program, sponsored by the Electric Power Research Institute (EPRI), developed 7 of the 23 improvements. These improvements are applicable to commercial BWR/2,3 and 4 nuclear power plants now in operation and in some cases those BWRs in the design and construction phase. Four of the recommended improvements can be implemented immediately by a utility without further technical development or plant unique modifications. Use of all improvements could reduce the fueling outage time by 7 days. This time savings represents an increase in plant availability, a significant cost savings in terms of replacement energy charges, and reductions in personnel radiation exposure. Each of the improvements are summarized.

30678 **(EPRI-NP—4032) Impact of colloidal chemistry on radioactivity transport in nuclear power plants.** Smith-Magowan, D. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Research and Development Center). May 1985. 98p. Research Reports Center, Box 509490, Palo Alto, CA 94303. File Number TI85920656.

A broad overview of colloid chemistry research is presented which highlights fundamental concepts and application to corrosion and radioactivity transport in water reactor coolant circuits. The purpose of this overview is to provide a basis for judging the degree of applicability of colloidal research to radioactivity transport and for judging the most feasible approach for measuring relevant properties of colloids under conditions typical of reactor operation. The oxide/solution interface is shown to be an important element in the mechanism of corrosion and the physical and chemical characteristics of such interfaces that relate to radioactivity transport are discussed. The zeta potential is introduced as the most important single property for characterizing the oxide/solution interface and associated phenomena such as adsorption and electrokinetics. The nature of electrokinetic processes is discussed in detail, since these form the bases for methods generally adopted for study of the interfaces in question. A design for a flat plate device for measuring streaming potentials is presented and recommended as the most feasible method for determining zeta potentials of oxide/solution interfaces at the temperatures and pressures characteristic of reactor coolant environments. Possible results from such studies are discussed as well as the applicability or relevance of these results to controlling radioactivity transport. 126 refs., 20 figs.

30679 (IAEA-TC—427/5, pp 200-206) **Non-equilibrium effects in flashing liquids.** Egely, G. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

A two-fluid model is discussed, which is able to describe thermal and mechanical non-equilibrium, as well as some existing computational methods and the difficulties of modelling.

30680 (IAEA-TC—427/5, pp 207-215) **Prediction of critical flow of subcooled and saturated water and comparison with the Marviken full scale experiments.** Persson, P.; Flinta, J. (Nuclear Safety Board of the Swedish Utilities, Nykoeping (Sweden)). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

A method developed for the prediction of critical flow of subcooled and saturated water is compared to the Marviken full scale experiments and some other relevant data. It is shown that this method gives better agreement with the data than other methods. Besides that, the method is relatively simple to use since its equations give the flow in an explicit form.

30681 (IAEA-TC—427/5) **Experimental and modelling aspects of small-break LOCA. 30682 (IWGFPT—20, pp 46-63) **Remarks on the cycle length extension of BWR plants.** Prosperi, M.; Repossini, S. (AGIP Nucleare, Milan (Italy)); Felici, S. (Ente Nazionale per l'Energia Elettrica, Rome (Italy)). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

The report underlines the interconnection between the bundle enrichment and the cycle length. A fuel cycle study on a BWR plant (with specific power of 55 KW/M, 560 fuel assemblies, control cell core loading and a fixed stretch-out of 1000 MWD/MTU) with the objectives of reaching the maximum cycle length is described. Relevant results, referring to an equilibrium cycle, can be summarized as follows: 1) The fulfillment of the 1% of shutdown margin and the preservation of the hot excess value above the 0.5%, for the entire cycle, required the use of 3 types of reload bundles. With such core loading the power distribution is satisfactory: using a non-optimized loading pattern, thermal performance parameters comparable or better than the ones attained with standard 12 months cycles were obtained. The cycle length (inclusive of the planned stretch-out of 1000 MWD/MTU) has reached 9750 MWD/MTU, the discharge batch BU has reached the value of 29,630 MWD/MTU. 2) The results infer that the adoption of the bundle design at high enrichments (with axially averaged enrichment of 3.5%): A) Can lead to a batch discharge BU of about 33,000 MWD/MTU, that is largely below the discharge limits. B) Can lead to a cycle length of about 10,800 MWD/MTU, which is closer to the value than most of the utilities estimate as optimal for a sound energy management.

30683 (IWGFPT—20, pp 64-70) **Optimized BWR fuel lattice for improved fuel utilization.** Bernander, O.; Helmersson, S.; Schoen, C.G. (ASEA-ATOM AB, Vaesteraas (Sweden)). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

Optimization of the BWR fuel lattice has evolved into the water cross concept, termed "SVEA", whereby the improved moderation within bundles augments reactivity and thus improves fuel cycle economy. The novel design introduces into the assembly a cruciform and double-walled partition containing nonboiling water, thus forming four subchannels, each of which holds a 4x4 fuel rod bundle. In Scandinavian BWRs - for which commercial SVEA reloads are now scheduled - the reactivity gain is well exploited without adverse impact in other respects. In effect, the water cross design improves both mechanical and thermal-hydraulic performance. Increased average burnup is also promoted through achieving flatter local power distributions. The fuel utilization savings are in the order of 10%, depending on the basis of comparison, e.g. choice of discharge burnup and lattice type. This paper reviews the design considerations and the fuel utilization benefits of the water cross fuel for non-Scandinavian BWRs which have somewhat different core design parameters relative to ASEA-ATOM reactors. For one design proposal, comparisons are made with current standard 8x8 fuel rod bundles as well as with 9x9 type fuel in reactors with symmetric or asymmetric inter-assembly water gaps. The effect on reactivity coefficients and shutdown margin are estimated and an assessment is made of thermal-hydraulic properties. Consideration is also given to a novel and advantageous way of including mixed-oxide fuel in BWR reloads.

30684 (IWGFPT—20, pp 269-281) **Performance of the plutonium-island fuel assemblies loaded into the Dodewaard boiling water reactor.** Breemer, N.C.; Engen, W.R. van; Hulst, P.J. von den (Gemeenschappelijke Kernenergiecentrale Nederland N.V., Arnhem); Haas, D.; Outryve d'Ydewalle, B. van (Societe Belge pour l'Industrie Nucleaire, Brussels). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

The 6x6 assemblies were designed to have the same performance as and to be interchangeable with a standard uranium assembly of the same reload. The assemblies were composed of 20 or 22 UO_2 pelletized rods at the bundle periphery, 1 MOX, a standard UO_2 or a fuelless grid support rod, 12 to 16 mixed oxide fuel rods and (in some assemblies) 2 Gadolinium doped UO_2 rods. Rods were pelletized, or vibro-compacted. Two MOX-assemblies were loaded into the reactor in April 1971 until April 1974 (cycles 2, 3, 4 and 5) and achieved an average bundle burnup of 20.2 GWd/tM. The assemblies appeared to have failed fuel rods (a standard UO_2-rod) at discharge, most probably developed during cycle 5. All MOX fuel rods remained entire. The remaining 5 assemblies were first loaded into the reactor in cycle 5 and 6 and remained there for 4 to 5 cycles. The maximum average bundle burnup achieved with these assemblies is 34.8 GWd/tM. The only leaking MOX-rod of these assemblies already occurred at the end of its first cycle in the reactor. Post-irradiation non-destructive tests contained: visual inspection, neutrography, gamma scanning, eddy current tests etc. Destructive PIE consisted of fuel rod punctures and gas analysis, residual gas analysis, hydrogen determination in the clad, metallographic examinations and microprobe analysis. The vibrocompacted fuel revealed a substantial higher central temperature than the pelletized fuel due to a different thermal conductivity.

30685 (NUREG—0975-Vol.3) **Compilation of contract research for the Materials Engineering Branch, Division of Engineering Technology. Annual report for FY 1984. Volume 3.** (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering Technology). Apr 1985. 398p. NTIS, PC A17/MF A01 - GPO. File Number TI85901503.

This compilation of annual reports by contractors to the Materials Engineering Branch of the NRC Office of Research, concentrates on achievments in safety research for the primary system of commercial light water power reactors, particularly with regard to reactor vessels, primary system piping, steam generators and for non-destructive examination of primary system components. This report, covering research conducted during Fiscal Year 1984, is the third volume of the series of NUREG-0975, compilation of Contractor Research for the Materials Engineering Branch, Division of Engineering Technology.

30686 (NUREG/CR—0200-Vol.3, pp vp, Section M6) **ORIGEN-S data libraries.** Ryman, J.C. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A21/MF A01 - GPO. File Number TI85007581. (ORNL/NUREG/CSD—2/Vol.3).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 3. Miscellaneous.

There are five card-image nuclear data libraries: (1) a small light element library for 253 nuclides, (2) a large light element library for 687 nuclides, (3) an actinide library for 101 nuclides, (4) a small fission product library for 461 nuclides, and (5) a large fission product library for 821 nuclides. The data for each nuclide are contained on five card-image records. The first card image contains decay data (half-life, branching fractions, recoverable energy per decay and the fraction of recoverable energy from photons), percent natural abundance, and radioactivity concentration guides. The last four card images contain cross section and (for fission product nuclides) fission yield data for four reactor types (HTGR, LWR, LMFBR, and MSBR), with one card for each reactor type. The card-image nuclear data libraries are the basic libraries for ORIGEN-S. The code can be run using these libraries directly, or it can be run from a binary data library which (prior to any cross section or other nuclear data updating) was created by running the COUPLE code to convert one or more of these card-image libraries.

30687 (NUREG/CR—3863) **Assessment of Class 1E pressure transmitter response when subjected to harsh environment screening tests.** Furgal, D.T.; Craft, C.M.; Salazar, E.A. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1985. Contract AC04-76DP00789. 196p. (SAND—84-1264). NTIS, PC A09/MF A01 - GPO. File Number TI85012824.

An experimental investigation into the performance of Class 1E electronic pressure transmitters exposed to environments within and beyond the design basis has been conducted. Emphasis was placed on determining the instruments' failure and degradation modes in separate and simultaneous environmental exposures. Five unaged ITT Barton Model 763 pressure transmitters were tested; each transmitter was exposed to a unique environment. The environments were (1) simulated Loss of Coolant Accident (LOCA) steam/chemical spray conditions alone, (2) temperature alone, (3) radiation alone, (4) simultaneous radiation and LOCA temperature (no steam) conditions, and (5) simultaneous radiation and simulated LOCA steam/chemical spray conditions. 23 refs., 33 figs., 8 tabs.

30688 (NUREG/CR—4086) **Tensile properties of irradiated nuclear grade pressure vessel welds for the third HSST irradiation series.** McGowan, J.J. (Oak Ridge National Lab., TN (USA)). Mar 1985. Contract AC05-84OR21400. 22p. (ORNL/TM—9477). NTIS, PC A02/MF A01 - GPO. File Number TI85009806.

The Heavy Section Steel Technology (HSST) Program conducted a series of experiments to investigate the effect of neutron irradiation on the fracture toughness of nuclear pressure vessel materials. Four welds of A 508 class 2 steel were examined in this Third HSST Irradiation Series. The welds were fabricated according to "early" (pre-1972) light-water reactor weld practice (i.e., copper-coated electrodes). As part of this study, tensile properties were measured after irradiation to 2 to 10 x 10^{22} neutrons/m^2 (E > 1 MeV) at temperatures between 250 and 290°C. Strength properties of all four welds increased with exposure to irradiation. Yield strength was more sensitive to irradiation than was ultimate strength. Tensile ductility was not affected significantly by exposure to irradiation.

30689 (NUREG/CR—4204) **Long-term embrittlement of cast duplex stainless steels in LWR systems. Annual report, October 1983-September 1984.** Chopra, O.K.; Chung, H.M. (Argonne National Lab., IL (USA)). Mar 1985. Contract W-31-109-ENG-38. 31p. (ANL—85-20). NTIS, PC A03/MF A01 - GPO. File Number TI85011158.

A program is being conducted to investigate the significance of in-service embrittlement of cast duplex stainless steels under light-water reactor operating conditions. The existing data are evaluated to determine the expected embrittlement of cast components during the operating lifetime of reactors and to define the objectives and scope of the investigation. Data for the metallurgical characterization of the various cast stainless steels used in the investigation are presented. Charpy impact tests on short-term aged material indicate that CF-3 stainless steels are less susceptible to embrittlement than CF-8 or CF-8M stainless steels. Embrittlement of the ferrite phase is primarily due to pinning of the dislocations by two of these precipitates, designed as Type M and Type X. The ferrite phase is embrittled after ~8 yr at 300°C and shows cleavage fracture. Examination of the fracture surfaces of the impact-test specimens indicates that the toughness of the long-term aged material is determined by the austenite phase. 5 refs., 7 figs., 6 tabs.

30690 (NUREG/CR—4221) **Evaluation of stress corrosion crack growth in BWR piping systems.** Kassir, M.; Sharma, S.; Reich, M.; Chang, M.T. (Brookhaven National Lab., Upton, NY (USA)). May 1985. Contract AC02-76CH00016. 77p. (BNL-NUREG—51874). NTIS, PC A05/MF A01 - GPO. File Number TI85012540.

This report presents the results of a study conducted to evaluate the effects of stress intensity factor and environment on the growth behavior of intergranular stress corrosion cracks in type 304 stainless steel piping systems. Most of the detected cracks are known to be circumferential in shape, and initially started at the inside surface in the heat affected zone near girth welds. These cracks grow both radially in-depth and circumferentially in length and, in extreme cases, may cause leakage in the installation. The propagation of the crack is essentially due to the influence of the following simultaneous factors: (1) the action of applied and residual stress; (2) sensitization of the base metal in the heat affected zone adjacent to girth weld; and (3) the continuous exposure of the material to an aggressive environment of high temperature water containing dissolved oxygen and some levels of impurities. Each of these factors and their effects on the piping systems is discussed in detail in the report. The report also evaluates the time required for hypothetical cracks in BWR pipes to propagate to their critical size. The pertinent times are computed and displayed graphically. Finally, parametric study is performed in order to assess the relative influence and sensitivity of the various input parameters (residual stress, crack growth law, diameter of pipe, initial size of defect, etc.) which have bearing on the growth behavior of the intergranular stress corrosion cracks in type 304 stainless steel. Cracks in large-diameter as well as in small-diameter pipes are considered and analyzed. 27 refs., 25 figs., 10 tabs.

30691 (EPRI-NP—3789) **Corrosion-product buildup on LWR fuel rods. Final report.** Strasser, A.; Sheppard, K.; Santucci, J. (Stoller (S.M.) Corp., New York (USA)). Apr 1985. 284p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920612.

The relationship between water chemistry and crud buildup on fuel rods was evaluated in two Westinghouse PWRs and two General Electric BWRs. Conditions for low and high crud buildup are compared, and the causes discussed. A survey of significant crud incidents in other LWRs is presented, and the causes discussed to the extent they are available. Operating methods that have been effective in minimizing crud deposits on fuel are presented, with some additional recommendations that will help in attaining this objective.

30693 (IAEA-TC—427/5, pp 51-63) **Modelling aspects and the research programme of the PMK-NVH test facility.** Szabados, L.; Toth, I.; Trosztel, I. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

Modelling aspects, system description and the preliminary research programme of the PMK-NVH integral type test facility are discussed. The PMK-NVH is a scaled model of the primary circuit of the Paks Nuclear Power Station.

30694 (IAEA-TC—427/5, pp 63-67) **Experimental and analytical studies of loop seal effects on the primary circuit.** Tuomisto, H. (Imatran Voima Oy, Helsinki (Finland)). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

The loop seals formed by bends in primary circuit loops may have an important effect on the water level in the reactor core during small and large LOCAs in a cold leg. The loop seal behaviour is not satisfactorily predicted by large computer codes applied to LOCA-analysis. That is why a 1:6.25 scaled primary circuit model was built to study different loop seal effects for the LOVIISA VVER-440 reactor. The tests have been carried out in the Hydraulic Laboratory of Imatran Voima Oy (Imatra Power Co Ltd). The results of these experiments performed in air-water mixture at atmospheric pressure are presented. Some of these tests were already referred to in papers presented in other meetings. An analytical model of the reactor core water level is also briefly discussed. This model was developed in the Technical Research Centre of Finland in order to make extensive studies of different parameters affecting the water level during an accident.

30695 (IAEA-TC—427/5, pp 68-76) **Experimental research of initially subcooled liquid flow from pressure vessels.** Suchanek, M.; Bartak, J. (Statni Vyzkumny Ustav pro Stavbu Stroju, Bechovice (Czechoslovakia)). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

This paper presents the results of an experimental research program of initially subcooled liquid flow through channels and orifices from pressure vessels of different volumes (0.2 m^3 and 1.0 m^3) and from a scaled model of the WWER-440 type reactor (scale factor 1:8). Several types of scaled reactor internals of an increasing complexity were used in the model. The initial coolant parameters were 12 MPa and 300 deg. C. Typical time behaviours of the main measured parameters (pressure, temperature, internals displacements, forces) are presented with emphasis on the initial period of coolant discharge affected by propagation of the depressurization rarefaction wave. The effect of several most important parameters (discharge channel or orifice inner diameter, rupture of the inlet or outlet pipe etc.) on the investigated phenomena is discussed. The experimental results are compared with the results obtained with the use of simplified mathematical models describing the different phenomena during discharge: rarefaction wave propagation, nonequilibrium phase change, critical two-phase flow.

30696 (IAEA-TC—427/5, pp 113-134) **Two-phase jet flows and forces.** Celata, G.P.; Cumo, M.; Farello, G.E.; Incalcaterra, P.C. (ENEA, Casaccia (Italy). Centro Ricerche Energia). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

With reference to Loss of Coolant Accidents in LWR's, and particularly small-break LOCAs, a detailed picture of the issuing two-phase jets is given. Experimental data concerning critical flows of subcooled and saturated liquid, together with saturated steam data are shown. The analysis refers to the jets external shape (obtained by means of photographic devices) and to the internal pressure distribution (obtained by means of a movable gauge travelling inside the issuing jet).

30697 (IAEA-TC—427/5, pp 237-255) **Computer studies on the applicability of test results on commercial nuclear power plants.** Pfau, H.; Sonneck, G. (Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H. Inst. fuer Reaktorsicherheit). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

An analytical study is described which investigates the effects of different parameters and different selected programme options on scaling distortion with respect to real processes. The study uses the intermediate-break test LOFT L5-1 as a reference, and employing RELAP4/MOD6 several models were tried for the LOFT reactor. Since the aim was to simulate the behaviour and the time sequence rather than to duplicate the experiment in all aspects, the number of volumes was reduced to 20 and less.

30698 (IKE—6-149) **Development and verification of a modular program system for calculation of the long-time behavior of pressurized water reactors.** Woerner, A. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme; Stuttgart Univ. (Germany, F.R.). Fakultaet 5 - Energietechnik). 14 Nov 1984. 206p. (In German). NTIS (US Sales Only), PC A10/MF A01. File Number DE85751620.

For the fuel management of nuclear power plants the time dependent fuel composition and power distribution within the reactor core has to be determined with high accuracy. The calculation of this long-time behaviour of the pressurized water reactors, taking into account the thermohydraulic feedback on the above mentioned distributions, has been integrated in a modular program system. The essential part of this program system is a newly developped nodal diffusion theory program which allows to describe approximately the local variation of cross sections within a node. The above mentioned computational method, making use of latest cross section data, permits reactor cycle calculations with high accuracy. This has been demonstrated by the verification of two reactor cycles of the Kernkraftwerk Obrigheim. In addition to this physical verification a benchmark problem comparison has been accomplished to prove the efficiency of the modular program system.

30699 (IWGFPT—20, pp 227-241) **Some aspects of plutonium recycling in thermal reactors.** Kamath, H.S.; Purushotham, D.S.C.; Sah, D.N.; Roy, P.R. (Bhabha Atomic Research Centre, Bombay (India). Radiometallurgy Div.). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

Plutonium recycling in thermal reactors is of great interest to our nuclear programme. Keeping this in view an experimental irradiation programme using mixed oxide (MOX) fuel has already been started to optimise various fuel design and fabrication parameters. Significant work relating to MOX fuel fabrication flow sheet and quality control methods have been carried out. A computer code PROFESS earlier developed to analyse UO_2 fuel performance is now being extended to predict and analyse the performance of MOX fuel. Two MOX fuel clusters have so far been irradiated to burn-ups beyond 15,000 MWd/Te at linear heat-ratings between 400 to 500 W/cm in a pressurised water loop of our research reactor, CIRUS (40 MWt). Two more MOX fuel clusters are also getting ready for irradiation. This paper discusses the various MOX fuel design concepts and fabrication parameters presently under investigation.

30700 (IWGFPT—20, pp 17-38) **Need for improved uranium utilization in Swiss nuclear power plants: Extended burn-up, Pu-recycle and Gadolinia fuels.** Bay, H. (Nordostschweizerische Kraftwerke A.G., Baden); Bodmer, R. (Kernkraftwerk Goesgen-Daeniken A.G., Daeniken (Switzerland)); Eichenberger, W.; Patak, H. (Elektrizitaetswerk Laufenburg A.G. From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

The three nuclear plants (four reactors) totalling approx. 2 GW(e) installed capacity now operating in Switzerland have stood at or close to the head of the world league table of plant availability and performance since the first went into operation in 1969. A fourth plant (1 GWe) is expected to come on line in 1984. One important reason for the good performance has been the excellent fuel behaviour achieved after some early teething troubles. Conservative fuel ratings and close attention to operating limits have contributed to the very satisfactory performance of the fuel. In spite of this the Swiss Utilities are actively pursuing improved fuel utilization for various reasons which vary from plant to plant depending on the operating philosophy, fuel management aims and characteristics of the plant. Extended burn-up to reduce fuel requirements and spent fuel arisings, longer cycle lengths, fuller utilization of existing cycles by more accurate operating and burn-up predictions, recycling of plutonium for improved fuel cycle economics are being actively examined and the paper will present the current status of these activities.

30701 (IWGFPT—20, pp 39-46) **Impact of extended burnups on core design.** Beltrame, M. (Neutronic Dept., Framatome, Paris La Defense (France)). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

Extended fuel burnup in PWR core leads to some problems for the reactor designer. Rather than a superficial survey of all problems we met in our studies, we point out those appearing the most important. The effects of such a high burnup may be classified in three points. Fuel management: We emphasize on the problems linked to the neutronic integrated flux on assembly components and reactor vessel. Reactivity control: Higher initial enrichments increase the reactivity of the core and lead to higher boron concentrations which have a strong impact on auxiliary systems. Plutonium concentrations at the end of life lead to stronger feedback coefficients and increase reactivity defect between full and zero power. This effect reduces the reactivity margin. Reactor control: We give some details on this effect and consequently on the liquid wastes volume.

30702 (IWGFPT—20, pp 86-98) **Belgian contributions to improved fuel utilization.** Bairiot, H.; Deramaix, P.; Vandenberg, C. (Societe Belge pour l'Industrie Nucleaire, Brussels). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

Worldwide R and D and irradiation experiments are carried out to improve the fuel utilization and to increase the power plant availability factor. The recycle of Pu and the use of Gd as burnable poison have a positive impact on the improvements to assembly design and to fuel management presently being demonstrated and even commercially implemented. This paper focuses on the importance of Belgian experience acquired in this field.

30703 (IWGFPT—20, pp 98-109) **Japanese fuel study related to extended burn-up and plutonium recycling.** Mishima, Y. (Tokyo Univ. (Japan)). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

Overview will be made on the Japanese activities on extended burn-up of LWR fuel and Pu recycling in thermal reactor fuel. As we are planning to recycle residual uranium-235 and plutonium formed through conversion in LWR fuel by reprocessing, the amount of burn-up extension will be made in a somewhat different way from what is carried out in case of one-through use of LWR fuel. Japan joined the Battelle High Burn Up programme to get necessary data. High enrichment fuel with higher gadolinium content has already been licensed to be trially irradiated in power reactor. Elongation of power reactor cycle has already been made up to 400 days and is planned up to 15 months in the next stage. There has been no problem until now, as 24 LWRs in Japan have been operated at the load factor of more than 70% in average during the past 3 years, with practically no fuel failure. Mixed oxide fuel for water reactor has already been successfully used in ATR prototype (pressure tube type, heavy water moderated, boiling light water cooled) to generate electricity without any fuel failure for 3 years and the target burn-up will be enhanced to 30,000 MWD/T (average) in its demonstration reactor of about 600 MWe, to be critical 10 years later. Use of Mox fuel in LWR is planned and authorised in the revised Long term Utilization Programme issued in '82 and trial use of a limited number of assemblies both in BWR and PWRs is planned, the fuel of which is thought to be fabricated in the PNC Tokai Facility. Private facility for Mox fuel is still at the stage of discussion. Related to the commercialization of FBR in Japan, a special committee has been working in JAEC as well as in MITI, and the integrated strategy for the utilization of plutonium in Japan is expected to be established before the respective projects will be put into practice.

30704 (IWGFPT—20, pp 125-133) **Calculation study of the WWER-440 fuel performance for extended burnup.** Kujal, J.; Pazdera, F.; Barta, O. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

The results of preliminary calculational study of extended burnup cycling schemes impact on WWER-440 fuel performance are presented. Two high burnup schemes were proposed with three and four cycles, resp. Comparison was made with three cycle reference case. The thermal mechanical analysis was performed with PIN and RELA codes. The values of rod internal pressure, fuel centerline temperatures and fuel-cladding gap are expressed as function of power history.

30705 (IWGFPT—20, pp 134-144) **LWR fuel rods for extended burnup - Design and experimental bases.** Gross, H.; Manzel, R. (Kraftwerk Union A.G., Erlangen (Germany, F.R.)). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

The increase in the portion of the fuel cycle costs related to reprocessing and intermediate or final storage challenges the fuel engineers to increase the discharge burnups of the fuel by increasing the initial enrichment. The most important aspects to be considered in the design of fuel for extended burnup appear to be waterside corrosion, fission gas release and pressure build-up, and axial fuel rod and assembly growth. The power ramping behaviour (at least for PWR's and BWR's applying PCI remedies) and long term creep deformation of the cladding seem to be of less importance. In connection with higher target burnups and extended cycle lengths burnable poison (Gadolinium) is used. In order to provide an experimental data base for high burnup fuel rods KWU has started very early to irradiate standard fuel rods beyond their initial target burnup. Results of the postirradiation examination of those highly irradiated fuel rods are presented that have also been used for the calibration and verification of the design codes. Analytical and experimental investigations showed, that a reduction of the rod power is advantageous with regard to high burnups. This has led in some cases to fuel assemblies with an increased number of fuel rods and with a decreased rod diameter. These fuel assemblies have an improved potential for high burnups compared to assemblies with higher linear heat generation rate.

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

E.D.F. has developed a high burnup program in its power plants. In this communication we will present briefly these different actions and particularly the results obtained in a 900 MWe power plant: five assemblies were irradiated during four cycles and have been examined after the fourth cycle - the assembly average burnup was between 41,700 and 47,400 MWd/tu; four fuel rods have been extracted from one assembly for hot cell examinations. The on-site measurements and the hot cell results are presented: the fuel behaved in accordance with predictions. The high burnup program is an important prerequisite to E.D.F.'s future nuclear fuel management strategy.

This paper reviews the results to date of the various research and development projects on burnup extension of LWR fuel being sponsored by the author's organizations. These projects include a large number of test assembly irradiations in power reactors, both of current-design fuel and of several advanced designs. The burnups attained to date are tabulated and the status of postirradiation examination of these assemblies is reviewed. Current U.S. thinking on the implications of these results on possible fuel life limiting phenomena is presented, together with discussion and prioritization of further work to be done. The further work under discussion includes, in addition to other advanced designs and life limiting effects, economic studies to determine optimum burnups under present and projected future cost structures and the design of desirable extended burnup fuel cycles for power reactors. These include low leakage fuel management, improved burnable absorbers to control power distributions, extended cycle lengths, and practical transitions toward extended burnup. Results of recent studies on the impacts of extended burnup on the external fuel cycle operations of fuel fabrication, fresh fuel storage, spent fuel storage, and spent fuel transportation are briefly reviewed. The majority of U.S. utilities have already made positive decisions to implement at least a first step of burnup extension in their operating reactors. The results of a recent survey of such implementation are presented, with estimates of percentage of reactors going to burnup extension and of average and maximum increases in burnups now committed. The discussion of these results includes review of various utility motivations, both for restraint and for pressing forward with burnup extension. A summary of burnup extensions already achieved is also included.

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

Future operating plans for Tihange unit 1 are based on cycle lengths approaching 18 months (from cycle 12). Since cycle 7, Gadolinia bearing assemblies were included in the reload batches in order to evaluate neutronic design methods employed. This Gadolinia program is briefly set out. Comparisons of measured to calculated data following the performance of the Gadolinia assemblies through cycles 7 and 8 are discussed. Loading pattern of cycle 9 including 4 Gadolinia high concentration assemblies and special features of cycle 10 are presented. An original device for "in situ" Gadolinia rod insertion into fresh assemblies is shortly described.

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

Since 1978 Duke Power Company, Arkansas Power and Light, Babcock and Wilcox, and the Department of Energy have been engaged in an extended-burnup development program. This program has been a resounding success in that the original goal of achieving burnups of 40,000 MWd/mtU, about a 20% increase over previous experience, was achieved by four assemblies in 1979, and today's fuel cycles are being designed to this level based on results obtained from the program. Furthermore, the program was amended in 1981 to include both the extension of the fuel performance data base to 50,000 MWd/mtU and the development of the technology to support the use of the fuel-burnable absorber mixture, urania-gadolinia, in pressurized water reactors. The irradiation of an assembly to 50,000 MWd/mtU was successfully completed in 1983 and detailed examinations of the assembly are underway. Five lead test assemblies each containing 12 UO_2-Gd_2O_3 rods began irradiation in Duke Power Company's Oconee Unit 1 reactor in August 1983. The performance of these lead test assemblies in their first cycle has been excellent, having met all physics testing and power distribution comparison criteria. Extended burnup offers benefits for essentially every step in the nuclear fuel cycle: mining, transportation, conversion, enrichment, fabrication, irradiation performance, storage, shipment, and disposal. Increasing the discharge burnup from 30,000 MWd/mtU to 50,000 MWd/mtU reduces yellowcake requirements by about 15% and separative work requirements by 1-3% depending upon the specific fuel cycle application. About 40% fewer fuel assemblies are required, thus, leading to a major reduction in spent fuel generation and significant savings for the back end of the fuel cycle. When used to extend cycle lifetime, e.g., to convert from annual to 18-month fuel cycles, extended burnup can lead to increased reactor availability, higher capacity factors, and lower generating costs.

30710 (IWGFPT—20, pp 165-170) **Fuel management with Gadolinium poison rods.** Bergeron, J.; Lenain, R. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

The capability of Gadolinium loaded fuel to meet the reactivity control requirements of typical high burn-up PWR (900 MWe) cycles is investigated. Special attention is paid to the search for the fuel characteristics and management, that optimize the core neutron behaviour in most aspects: fuel enrichment in U^{235}, Gadolinium texture (grain size ranging from 0 to 500 μm), number of poisoned rods per assembly, fuel loading pattern (2 or 3 batches), residual poison efficiency ... The main objectives of the study are to ensure a negative moderator temperature coefficient in zero power conditions and to provide an acceptable spatial power distribution according to the usual criteria (two dimensional shape factor Fsub(N)sup(H) limited to 1,435). Finally, the comparative analysis of the thermal transient experienced by UO_2 and UO_2/Gd_2O_3 rods in case of a control rod ejection accident, assesses the consequences of the degraded thermal properties of the Gadolinium loaded fuel and the resulting need for a reduced enrichment in U^{235} within the poisoned rods.

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

The choice of Gadolinium as burnable poison for reactivity control was first taken in Belgium for the BR3 PWR, in 1971. After some starting problems related to the difficulty in calculating correctly the Gd depletion versus burnup, the methods were progressively improved and the use of Gd was extended by increasing the number of Gd rods and the standard Gd content in BR3 from 3 to 7 w/o Gd_2O_3 in the Gd rods. In parallel, Gd was first used in a large Belgian PWR in Tihange 1 (8 w/o Gd_2O_3, but with natural uranium). Amongst the programmes organized in collaboration between CEN/SCK and BELGONUCLEAIRE: national programmes are going on in BR3 (study of the irradiation behaviour of various types of Gd fuels at high burnup) and are in planning in BR2 (basic neutronic experiments); two programmes sponsored by international partners have been launched: GAIN, which is basically studying the burnup behaviour of different fuel designs and GAP which is devoted to the neutronic codes benchmarking. The present status of both national and international programmes is outlined hereafter.

30712 (IWGFPT—20, pp 182-207) **Post-irradiation examination of plutonium-bearing fuel elements irradiated in LWR power plants. A European Community campaign.** Cadelli, N. (Commission of the European Communities, Brussels (Belgium)); Lippens, M. (Societe Belge pour l'Industrie Nucleaire, Brussels). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

In the framework of the E.C. programme "Plutonium Recycling in LWR", a series of post-irradiation examinations were carried out on mixed-oxide fuel elements irradiated in LWR's. The examinations were performed in 10 campaigns on fuel irradiated in the following power reactors: Garigliano, Dodewaard, SENA, Lingen and BR3 as well as in the HFR. The paper subdivided in three parts describes first the extent of the R and D programme for five of these campaigns; that is the main characteristics of 95 examined fuel rods, their irradiation conditions and the examinations techniques involved. Then, the essential experimental results of the programme are summarized: clad deformations, fuel microstructure, fission gas release and gamma activity distributions. The second part of the paper is devoted to the analysis of these results, leading to a comparative description of the in-reactor behaviour of the uranium-plutonium oxide and the uranium oxide fuels. The last part of the paper summarizes the confrontation between the observed in-reactor behaviour and the predictions of the thermo-mechanical fuel behaviour using the COMETHE III-L code and the isotopic compositions anticipated using the ORIGEN-2 code. The campaign is not yet entirely completed but all results so far obtained allow to conclude that: in no case plutonium fuel has perturbed the normal operation of a power reactor; no rod failure due specifically to the behaviour of the mixed-oxide fuel could be detected; the behaviour of the rods, up to a burn-up typical for power LWR, has always been found to be at least as good as that of the traditional uranium oxide rods; the fuel behaviour under irradiation and the evolution of its isotopic composition can be predicted using existing codes with a very good accuracy. The correlation of fission gas release however is not so good for all the experiments.

30713 (IWGFPT—20, pp 208-227) **KWU/ALKEM experience in thermal Pu-recycling.** Roepenack, H. (Alpha Chemie und Metallurgie G.m.b.H. (ALKEM), Hanau (Germany, F.R.)); Schlemmer, F.; Schlosser, G. (Kraftwerk Union A.G., Erlangen (Germany, F.R.)). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

Thermal Pu-recycling experience at KWU/ALKEM dates back as far as the mid-60s. Following the successful introduction of test fuel assemblies, thermal Pu-recycling has been demonstrated on a large scale since the beginning of the 70s in the power plants at Kahl (VAK), Gundremmingen (KRB-A) and Obrigheim (KWO). During the last few years improved fabrication processes were developed resulting in MOX-fuel with favourable reprocessing properties. The AUPuC-process, a co-conversion process, is used if the starting material is available as plutonium nitrate solution. In the case of plutonium oxide being the starting material the OCOM-process, a co-milling process, is used. Since 1981 thermal Pu-recycling has been carried on with the improved MOX-fuel at Obrigheim (KWO) and since 1982 at Neckarwestheim (GKN). As agreed with the German utilities in the near future Pu-recycling will be concentrated in PWRs. Optimization of the nuclear design led to a MOX-fuel assembly with a minimum of 2 types of rods of different Pu-content. High flexibility exists in the number of MOX-fuel assemblies to be loaded in PWR cores. Extensive experience has been gained during the large-scale German recycling programmes. The MOX-fuel assemblies inserted up to now exhibit an operating performance which is as good as that of the uranium fuel assemblies supplied by KWU. The experience was extended by the irradiation of special test rods. Postirradiation investigations on MOX-fuel show high mechanical stability, low shrinkage and swelling and good behaviour at power transients. On the basis of this experience the large-scale use of MOX-fuel is technically feasible and will be extended to PWRs of the 1300 MWe type in 1984.

(Societe Belge pour l'Industrie Nucleaire, Brussels); Motte, F. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

The Belgian PWR BR3 has been utilized extensively since 20 years for testing the irradiation behaviour of MOX fuel under several operating conditions. In parallel, the increasing proportion (30% of all the rods) of MOX rods in the core as well as the use of Gd as burnable poison for reactivity control, have required to update continuously the neutronic calculation methods. This paper summarizes the main steps of Pu utilization in BR3, with an emphasis on the present situation, and presents the main conclusions on the following two aspects: the neutronic design methods and their validation and the strategies core and assemblies loading patterns; the general mechanical behaviour of MOX fuels, which have been irradiated up to extremely high burnups (up to 80 GWd/tM peak pellet).

30715 (LA-UR—85-1729) **Application of detailed fission-product decay gamma spectra in the calculation of photoneutron spectra from D(γ,n) reactions in PWR fuel.** Wilson, W.B.; Stewart, J.E.; England, T.R.; Perry, R.T. (Los Alamos National Lab., NM (USA); Texas A and M Univ., College Station (USA)). 1985. Contract W-7405-ENG-36. 5p. (CONF-850507—23). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012729.

From International conference on nuclear data for basic and applied science; Santa Fe, NM, USA (13 May 1985).

The magnitude, average neutron energy, and spectrum of the photoneutron source in a PWR fuel is calculated for shutdown times to 100 y using CINDER radionuclide inventory calculations, ENDF/B-V γ line decay spectra, MCNP γ transport calculations, and PHONEX D(γ,n) reaction physics calculations.

30716 (LPA-P—2) **Sizewell 'B' public inquiry. Proof of evidence on noise implications of construction and operation.** Ratcliffe, K. (Suffolk County Council, Ipswich (UK); Suffolk Coastal District Council, Woodbridge (UK)). Apr 1983. 41p. British Library Lending Division, Boston Spa, Wetherby, LS23 7BQ.

The report is in sections entitled: qualification of witness; introduction; background noise; design criteria for steady state operational noise for Sizewell-B; construction noise; traffic noise; case history of construction of other power stations.

30717 (NUREG/CR—3723) **Stress-intensity-factor influence coefficients for surface flaws in pressure vessels.** Ball, D.G.; Bass, B.R.; Bryson, J.W.; Cheverton, R.D.; Drake, J.B. (Oak Ridge National Lab., TN (USA)). Feb 1985. Contract AC05-84OR21400. 49p. (ORNL/CSD/TM—216). NTIS, PC A03/MF A01 - GPO. File Number TI85006633.

In the fracture-mechanics analysis of reactor pressure vessels, stress-intensity-factor influence coefficients are used in conjunction with superposition techniques to reduce the cost of calculating stress-intensity factors. The present study uses a finite-element code, together with a virtual crack extension technique, to obtain influence coefficients for semielliptical surface flaws in a cylinder, and particular emphasis was placed on mesh convergence (less than 1% error was sought in the results from any one mesh construction parameter). Comparison of the coefficients with those obtained by other investigators shows good agreement. Furthermore, stress-intensity factors obtained by superposition for a severe thermal-transient loading condition agree within 1% of the values calculated by a direct finite-element method. Influence coefficients were calculated for three specific axially oriented semielliptical surface flaws. The first was a 2-m-long inner-surface flaw in a nuclear reactor pressure vessel with depth-to-wall-thickness ratios between 0.2 and 0.9. The second was an inner-surface flaw in the reactor vessel with a surface-length-to-depth ratio of 6 and with depth-to-wall-thickness ratios between 0.05 and 0.2. The third was a 1-m-long flaw on the outer surface of a test vessel with depth-to-wall-thickness ratios between 0.1 and 0.9. For the reactor vessel, separate coefficients were calculated for the cladding on the inner surface and for the base-material region. This allows for an accurate accounting of the effect of thermal stresses in the cladding on the stress-intensity factor for surface flaws that extend through the cladding into the base material.

30718 (NUREG/CR—4149) **Ultimate pressure capacity of reinforced and prestressed concrete containments.** Sharma, S.; Wang, Y.K.; Reich, M. (Brookhaven National Lab., Upton, NY (USA)). May 1985. Contract AC02-76CH00016. 91p. (BNL-NUREG—51857). NTIS, PC A05/MF A01 - GPO. File Number TI85012868.

This report presents the results of an in-depth evaluation of current modeling techniques and analysis procedures for determining ultimate pressure capacity of reinforced and prestressed concrete containments. The material used for describing the nonlinear material behavior of concrete and steel are reviewed in detail. Special attention is focused on post-cracking behavior of concrete which controls one of the containment failure modes, i.e., the shear failure. Various finite element idealizations utilized for containment analysis are reviewed. The effects of major assumptions pertaining to containment geometry, basemat restraint, finite element mesh, rebar locations and orientations, are evaluated. Finally, failure analyses of two selected reinforced and prestressed concrete containments are performed and results are compared with those presented in the literature. 27 refs., 25 figs.

30719 (TP—82-36) **Startup and commissioning of pressurized water reactors.** Albert, L.J.; Gilbert, C.F. (Stone and Webster Engineering Corp., Boston, MA (USA)). May 1983. 23p. (CONF-8305259—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701494.

From Canadian Nuclear Society commissioning symposium; Toronto, Ontario, Canada (3 May 1983).

A critical phase of plant development is the test, startup, and commissioning period. The effort expended prior to commissioning has a definite effect on the reliability and continuing availability of the plant during its life. This paper describes a test, startup, and commissioning program for a pressurized water reactor (PWR) plant. This program commences with the completion of construction and continues through the turnover of equipment/systems to the owner's startup/ commissioning group. The paper addresses the organization of the test/startup group, planning and scheduling, test procedures and initial testing, staffing and certification of the test group, training of operators, and turnover to the owner.

30720 **Monitoring system for a liquid-cooled nuclear fission reactor.** DeVolpi, A. (to Dept. of Energy). US Patent Application 6-632,743. 20 Jul 1984. 35p. Contract W-31-109-ENG-38.

The invention provides improved means for detecting the water levels in various regions of a water-cooled nuclear power reactor, viz., in the downcomer, in the core, in the inlet and outlet plenums, at the head, and elsewhere; and also for detecting the density of the water in these regions. The invention utilizes a plurality of exterior gamma radiation detectors and a collimator technique operable to sense separate regions of the reactor vessel to give respectively, unique signals for these regions, whereby comparative analysis of these signals can be used to advise of the presence and density of cooling water in the vessel.

30721 (CE-Trans—7693) **Activation products and dose rate, using Unit A of the Biblis Nuclear Power Station as an example.** Paffrath, G.; Ambros, R. Translated from *VGB Kraftwerkstechnik ;* **60**: No. 2, 121-124(1980). 11p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85900178. DE85900178

During normal reactor operation, the dose rate at the primary circuit components is generated by fission and activation products. When the plant is run down to standstill, the fission products decay in accordance with their physical half-life and, in addition, are extracted from the primary coolant by means of ion exchangers at decontamination ratios of >100. The activation products which exist suspended in the coolant, partially in ion form and partially as undissolved particles, are generally exchanged only at a decontamination ratio of <10 at the ion exchangers. The half-life of the nuclides relevant to dose is of the order of one year and longer. Thus the activation products absorbed or adsorbed at the protective layers of the inner surface of the primary circuit components during the shut-down process are the main contributors to the dose rate found after reactor switch-off. Depending on the dose rate generated by the activation products, special radiation safety measures such as installing screens, limiting the working time or decontaminating systems and single components must be provided during shut-downs and inspections for inspections and repairs on primary circuit components.

30723 **(AGESTA—1-027) OECD/NEA Agesta Decontamination Project. Phase 1, final report. Volume 1. Project description and overview of results.** (Studsvik Energiteknik AB, Nykoeping (Sweden)). Dec 1982. 25p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011305.

The objective of the Agesta Decontamination Project, which has been organized by the Nuclear Energy Agency, Paris, is to utilize the four primary loops of the Agesta reactor to demonstrate decontamination methods for PWR primary systems. The first phase of the project consisted of laboratory scale tests. The test programme consisted of decontamination tests on steam generator tubing and other active material from Agesta and number of operating reactors as well as material compatibility tests on standardized samples of a representative selection of modern PWR primary system materials. The results show that all six processes in general met the acceptance criteria both regarding decontamination and corrosion. The decontamination results with the hard chemistries were rather uneven. 4 refs., 2 figs., 5 tabs.

30724 ***(BWC—83-93) Start-up support for New Brunswick Electric's Point Lepreau nuclear steam generators.** Schneider, W.; Leroux, A. (Babcock and Wilcox Canada Ltd., Cambridge, Ontario). May 1983. 9p. (CONF-8305259—2). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701495.

From Canadian Nuclear Society commissioning symposium; Toronto, Ontario, Canada (3 May 1983).

The start-up of the 600 MW Point Lepreau reactor provided the opportunity for direct involvement in the important low and medium power start-up phase which was of particular interest because this was a first-of-a-kind reactor type incorporating a new steam generator design. Support included test assistance and test results interpretation for the thermal hydraulic performance of the steam generators and in particular, investigation of water level response to operating pressure, power and feed flow. This work resulted in both a greatly improved understanding of transient characteristics and in a number of beneficial refinements in the control methods.

30725 (IAEA-TC—427/5, pp 77-93) **Flow behaviour in a CANDU horizontal fuel channel from stagnant subcooled initial conditions.** Caplan, M.Z.; Gulshani, P.; Holmes, R.W.; Wright, A.C.D. (Atomic Energy of Canada Ltd., Sheridan Park, Ontario. CANDU Operations). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

The flow behaviour in a CANDU primary system with horizontal fuel channels is described following a small inlet header break. With the primary pumps running, emergency coolant injection is in the forward direction so that the channel outlet feeders remain warmer than the inlet thereby promoting forward natural circulation. However, the break force opposes the forward driving force. Should the primary pumps run down after the circuit has refilled, there is a break size for which the natural circulation force is balanced by the break force and channels could, theoretically, stagnate. Result of visualization and of full-size channel tests on channel flow behaviour from an initially stagnant channel condition are discussed. After a channel stagnation, the decay power heats the coolant to saturation. Steam is then formed and the coolant stratifies. The steam expands into the subcooled water in the end fitting in a chugging type of flow regime due to steam condensation. After the end fitting reaches the saturation temperature, steam is able to penetrate into the vertical feeder thereby initiating a large buoyancy induced flow which refills the channel. The duration of stagnation is shown to be sensitive to small asymmetries in the initial conditions. A small initial flow can significantly shorten the occurrence and/or duration of boiling as has been confirmed by reactor experience.

30726 (IAEA-TC—427/5, pp 99-113) **Two-phase natural circulation experiments in a pressurized water loop with figure-of-eight symmetry.** Ardron, K.H.; Krishnan, V.S.; McGee, G.R.; Anderson, J.W.D.; Hawley, E.H. (Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

To provide information on two-phase natural circulation in a CANDU-type circuit geometry a series of tests has been performed in the RD-12 loop at Whiteshell Nuclear Research Establishment. RD-12 is a 10-MPa pressurized-water loop containing two active boilers, two pumps, and two or four heated horizontal channels arranged in a symmetrical figure-of-eight configuration characterizing the CANDU, primary heat-transport system. In the tests, single-phase natural circulation was first established in the loop, and void was then introduced by controlled draining with the surge tank (pressurizer) valved out of the system. The experiments indicate that a stable, two-phase, natural circulation flow can usually be established. However, as the void in the loop is increased, large-amplitude flow oscillations can occur. Initially the flow oscillations in the two halves of the loop are usually very nearly 180 deg. out-of-phase. However, as the loop inventory is decreased, an in-phase oscillation component is observed. In tests with two parallel heated channels in each half loop, oscillations associated with mass transfer between the channel pairs are also observed. Although the flow oscillations can lead to intermittent dry-out of the upper elements of the heater-rod assemblies in the horizontal channels, the natural circulation cooling appears to be effective until about 50 percent of the loop inventory is drained; sustained flow stratification then occurs in the heated channels, leading to heater temperature excursions. The paper reviews the experimental results obtained and describes the evolution of natural circulation flow in particular cases as voidage is progressively increased. The stability behaviour is discussed briefly with reference to a simple stability model.

30727 **(INFO—0080) Exporting the Canadian licensing program.** Whelan, D.J. (Atomic Energy Control Board, Ottawa, Ontario (Canada)). Jun 1981. 6p. (CONF-8106200—29). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701281.

From 21. annual international conference of Canadian Nuclear Association and 2. annual conference of Canadian Nuclear Society; Ottawa, Canada (8 Jun 1981).

This paper deals with the problems of an overseas regulatory agency in licensing a Canadian-supplied nuclear plant which is referenced to a plant in Canada. Firstly, the general problems associated with the use of a reference plant are discussed. This is followed by a discussion of specific problems which arise from the licensing practices in Canada. The paper concludes with recommendations to simplify the task of demonstrating the licensability of an overseas CANDU plant.

30728 (IWGFPT—20, pp 70-74) **Thorium fuels for heavy water reactors. Romanian experience.** Glodeanu, F.; Mirion, I.; Mehedinteanu, S.; Balan, V. (Institutul de Reactori Nucleari Energetici, Pitesti (Romania)). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

The renewed interest in thorium fuel cycle due to the increased demand for fissile materials has resulted in speeding up the related research and development activities. For heavy water reactors the thorium cycles, especially SSET, are very promising and many efforts are made to demonstrate their feasibility. In our country, at INPR, the research and development activity has been initiated in the following areas: the conceptual design of thorium bearing fuel elements; fuel modelling; nuclear grade thorium dioxide powder technology; mixed oxide fuel technology. In the design area, the key factors in performance limitation, especially at extended burnup have been accounted and different remedies proposed. An irradiation programme has been settled and will start this year. The modelling activities are focused on mixed oxide behaviour and material data measurements are in progress. In the nuclear grade thorium powder technology area, a good piece of work has been done to develop an integrated technology for monasite processing (thorium being a by-product in lanthanides extraction). As regards the mixed oxide fuel technology, efforts have been made to obtain $(ThU)O_2$ pellets with good homogeneity and high density at different compositions. Besides the mixing powders route, other non-conventional technologies for refabrication like: microspheres, pellet impregnation and clay extrusion are studied. Experimental fuel rods for irradiation testing have been manufactured.

30729 (IWGFPT—20, pp 110-124) **Graphite disc - oxide fuel elements for high powers and extended burnups.** MacDonald, R.D.; Hastings, I.J. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

We have irradiated graphite disc annular UO_2 fuel elements over a burnup range of 120 to 800 MW.h/kgU (5000 to 33,000 MWd/teU) at linear powers between 30 and 70 kW/m. Temperature limits for fuel-to-disc and disc-to-sheath contact have been fixed; the length/diameter ratio of the pellets and disc thickness to optimize cooling have also been established. The test irradiations confirmed the excellent dimensional stability of disc fuel. Average sheath strains were generally less than 0.2% and circumferential ridges over pellet interfaces were half the heights of ridges on elements without discs. The fission gas released from disc/annular elements was up to four times less than that from annular fuel alone. The internal stability of the fuel was acceptable; although the central hole in the pellets changed shape, the discs retained their effectiveness in cooling the fuel. Disc compatibility with the UO_2 fuel and Zircaloy sheath was good. Disc fuel elements were tolerant of power ramps at high burnups, and showed acceptable detect behaviour. A computer code to predict the irradiation behaviour of disc fuel elements has been developed and verified against data from inreactor tests.

30730 (IWGFPT—20, pp 257-269) **Development of ATR MOX fuels.** Domoto, K.; Yokouchi, Y. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)); Mishima, Y. (Tokyo Univ. (Japan)). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

Power Reactor and Nuclear Fuel Corporation (PNC) has carried out a number of irradiation examination programmes in order to clarify the behavior of plutonium-uranium mixed oxide (MOX) fuels and to develop design codes. Important items to evaluate the performace of MOX fuel rods are mainly cladding deformation and fission gas release. This report presents results of MOX fuel in-pile tests and their post-irradiation examinations in HBWR (Halden Boiling Water Reactor) and SGHWR. IN HBWR, on-line measurements are being performed on fuel center line temperature, plenum pressure, cladding elongation and fuel stach length. Peak fuel burnup is about 25,000 Mwd/t at present and peak linear heat rating was 458 W/cm. The behaviours of MOX fuel rods are evaluated by comparing the on-line measurements with anlayses made by design codes. In SGHWR, measurements of fission gas release and cladding deformation in the post-irradiation examination were performed. Peak burnup was 9,860 Mwd/t and peak linear heat rating 489 W/cm. Evaluation of irradiated MOX fuels was made by comparing irradiation results with the calculated results by design codes. Since fretting corrosion of cladding by spacer grids has an important influence on the integrity of the fuel assembly and its endurance, fretting corrosion tests, using a full scale fuel assembly, have been performed over 30,000 hours and no problem has been observed.

30731 (RPC-E—83/47) **Innovative ultrasonics for power plant commissioning.** Murphy, R.V.; Alikhan, S. (New Brunswick Research and Productivity Council, Fredericton (Canada)). May 1983. 30p. (CONF-8305259—3). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701496.

From Canadian Nuclear Society commissioning symposium; Toronto, Ontario, Canada (3 May 1983).

During the commissioning of a nuclear power plant, the usual role of ultrasonics is associated with nondestructive testing of welds. There is, however, a variety of undesirable conditions associated with the fluids carried through the various reactor systems which may be just as important to station operation. A variety of unusual ultrasonic techniques has been developed for testing fluid systems at the Point Lepreau Generating Station. This paper uses the experience gained at the Point Lepreau reactor to illustrate the valuable information which can be gained from these measurements, such as: fluid level in pipes and headers; fluid level in pressure vessels; detection, and sizing of debris in pipes; in situ measurement and verification of orifice condition; detection and location of cavitation, water hammer, valve leakage; quantitative measurement of gate movement within the body of an inservice valve; determination of valve position; detection and imaging of flow separation; detection and location of leaks in concrete containment structures; verification of design flows; balancing of loop flows; and detection of low flow. The application of these techniques at other reactor sites is also discussed.

30732 (BNL—36312) **Spallator - accelerator breeder.** Steinberg, M. (Brookhaven National Lab., Upton, NY (USA)). Jan 1985. Contract AC02-76CH00016. 8p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012276.

The concept involves the use of spallation neutrons produced by interaction of a high energy proton (1 to 2 GeV) from a linear accelerator (LINAC) with a heavy metal target (uranium). The principal spallator concept is based on generating fissile fuel for use in LWR nuclear power plants. The spallator functions in conjunction with a reprocessing plant to regenerate and produce the Pu-239 or U-233 for fabrication into fresh LWR reactor fuel elements. Advances in proton accelerator technology has provided a solid base for predicting performance and optimizing the design of a reliable, continuous wave, high-current LINAC required by a fissile fuel production machine.

30733 **(CONF-850410—40) Forced-convection boiling tests performed in parallel simulated LMR fuel assemblies.** Rose, S.D.; Carbajo, J.J.; Levin, A.E.; Lloyd, D.B.; Montgomery, B.H.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). 21 Apr 1985. Contract AC05-84OR21400. 8p. NTIS, PC A02/MF A01. File Number TI85011429.

From ANS/ENS fast reactor safety meeting; Knoxville, TN, USA (21 Apr 1985).

Forced-convection tests have been carried out using parallel simulated Liquid Metal Reactor fuel assemblies in an engineering-scale sodium loop, the Thermal-Hydraulic Out-of-Reactor Safety facility. The tests, performed under single- and two-phase conditions, have shown that for low forced-convection flow there is significant flow augmentation by thermal convection, an important phenomenon under degraded shutdown heat removal conditions in an LMR. The power and flows required for boiling and dryout to occur are much higher than decay heat levels. The experimental evidence supports analytical results that heat removal from an LMR is possible with a degraded shutdown heat removal system.

30734 **(CONF-850410—42) Evaluation of a hanging core support concept for LMR application.** Burelbach, J.P.; Cha, B.K.; Huebotter, P.R.; Kann, W.J.; Pan, Y.C.; Saiveau, J.G.; Seidensticker, R.W.; Wu, T.S. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 19p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012116.

From ANS/ENS fast reactor safety meeting; Knoxville, TN, USA (21 Apr 1985).

The paper describes an innovative design concept for a liquid metal reactor (LMR) core support structure (CSS). A hanging core support structure is described and analyzed. The design offers inherent safety features, constructability advantages, and potential cost reductions. Some safety considerations are examined which include the in-service inspection (ISI), the backup support system and the structural behavior in a hypothetical case of a broken beam in the core support structure.

30735 **(CONF-850610—2) Steam generator model for real-time analysis.** Tzanos, C.P. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85006194.

From Annual meeting of the American Nuclear Society; Boston, MA, USA (9 Jun 1985).

Plant safety as well as plant availability can significantly be improved if functions such as data validation, plant state verification and fault identification are automated. This can be achieved if computers are utilized, with plant models that run in real-time, for continuous on-line plant information processing and analysis. Such models can also be used in plant simulators for operator training. This paper presents a model for real-time analysis of a once-through liquid-metal fast breeder reactor (LMFBR) steam generator.

30736 **(CONF-850610—12-Summ.) Proposed fuel cycle for the Integral Fast Reactor.** Burris, L.; Walters, L.C. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85006224.

From Annual meeting of the American Nuclear Society; Boston, MA, USA (9 Jun 1985).

One of the key features of ANL's Integral Fast Reactor (IFR) concept is a close-coupled fuel cycle. The proposed fuel cycle is similar to that demonstrated over the first five to six years of operation of EBR-II, when a fuel cycle facility adjacent to EBR-II was operated to reprocess and refabricate rapidly fuel discharged from the EBR-II. Locating the IFR and its fuel cycle facility on the same site makes the IFR a self-contained system. Because the reactor fuel and the uranium blanket are metals, pyrometallurgical processes (shortned to "pyroprocesses") have been chosen. The objectives of the IFR processes for the reactor fuel and blanket materials are to (1) recover fissionable materials in high yield; (2) remove fission products adequately from the reactor fuel, e.g., a decontamination factor of 10 to 100; and (3) upgrade the concentration of plutonium in uranium sufficiently to replenish the fissile-material content of the reactor fuel. After the fuel has been reconstituted, new fuel elements will be fabricated for recycle to the reactor.

30737 **(CTA-IEAV-NT—019/83) Studies of LMFBR: method of analysis and some results.** Ishiguro, Y.; Dias, A.F.; Nascimento, J.A. do. (Centro Tecnico Aeroespacial, Sao Jose dos Campos (Brazil). Inst. de Estudos Avancados). 1983. 67p. (In Portuguese). NTIS (US Sales Only), PC A04/MF A01. File Number DE85701497.

Some results of recent studies of LMFBR characteristics are summarized. A two-dimensional model of the LMFBR is taken from a publication and used as the base model for the analysis. Axial structures are added to the base model and a three-dimensional (Δ - Z) calculation has been done. Two dimensional (Δ and RZ) calculations are compared with the three-dimensional and published results. The eigenvalue, flux and power distributions, breeding characteristics, control rod worth, sodium-void and Doppler reactivities are analysed. Calculations are done by CITATION using six-group cross sections collapsed regionwise by EXPANDA in one-dimensional geometries from the 70-group JFS library. Burnup calculations of a simplified thorium-cycle LMFBR have also been done in the RZ geometry. Principal results of the studies are: (1) the JFS library appears adequate for predicting overall characteristics of an LMFBR, (2) the sodium void reactivity is negative within - 25 cm from the outer boundary of the core, (3) the halflife of Pa-233 must be considered explicitly in burnup analyses, and (4) two-dimensional (RZ and Δ) calculations can be used iteratively to analyze three-dimensional reactor systems.

30738 **(CTA-IEAV-NT—023/83) Some basic considerations about the Brazilian nuclear program.** Ishiguro, Y. (Centro Tecnico Aeroespacial, Sao Jose dos Campos (Brazil). Inst. de Estudos Avancados). 1983. 9p. (In Portuguese). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701498.

In order to assure the continued utilization of fission energy development of fast breeder reactors is a necessity. Binary fueled LMFBRs are proposed as the best type for future Brazilian nuclear systems. The inherent safety characteristics are superior to current fast breeder reactors and an efficient utilization of thorium can be realized. A possible strategy for the development of the reactor and related technologies are discussed.

30739 **(CTA-IEAV-NT—024/83) Project of a binary breeder reactor and its inherent safety.** Nascimento, J.A. do; Dias, A.F.; Ishiguro, Y. (Centro Tecnico Aeroespacial, Sao Jose dos Campos (Brazil). Inst. de Estudos Avancados). 1983. 12p. (In Portuguese). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701499.

A core layout for the binary breeder reactor (BBR) is developed based on the results of preliminary burnup calculations. In the U^{233}/TH fueled inner core, the apparent breeding ratio is low due to the accumulation of Pa-233 in the first few months of operation. The loss of reactivity during this time is approximatelly 3%. The BBR requires more reactivity control than Pu/U-fueled LMFBRs and the core layout developed has 19 control rod assemblies in the inner core. Three aspects related to the inherent safety of the BBR have been studied: radial distribution of the sodium-void reactivity, zone-wise Doppler reactivity, and the delayed neutron fractions. Results show excellent safety characteristics of the BBR.

30740 **(CTA-IEAV-NT—025/83) Burnup characteristics of binary breeder reactors.** Dias, A.F.; Nascimento, J.A. do; Ishiguro, Y. (Centro Tecnico Aeroespacial, Sao Jose dos Campos (Brazil). Inst. de Estudos Avancados). 1983. 15p. (In Portuguese). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701500.

Burnup calculations of a binary breeder reactor have been done for two cases of fueling. In one case the U^{233}/TH fueled inner core and the Pu/U-fueled outer core have the same number of fuel assemblies. In the other case two outermost rings in the inner core are Pu/U-fueled. The second case is considered for an initial phase of thorim cycle introduction when the supply of U^{233} could be limited. Results show an efficient breeding on the thorium cycle in both cases.

30741 (CTA-IEAV-NT—026/83) Option for the Brazilian nuclear project: necessity of fast breeder reactors and core design for an experimental fast reactor. Ishiguro, Y. (Centro Tecnico Aeroespacial, Sao Jose dos Campos (Brazil). Inst. de Estudos Avancados). 1983. 16p. (In Portuguese). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701501.

In order to assure the continued utilization of fission energy, development of fast breeder reactors (FBRs) is a necessity. Binary fueled LMFBRs are proposed as the best type for future Brazilian nuclear systems. The inherent safety characteristics are superior to current FBRs and an efficient utilization of the abundant thorium is possible. A first step and a basic tool for the development of FBR technologies is the construction and operation of an experimental fast reactor (EFR). A series of core designs for a 90 MW EFR is studied and possible options and the magnitudes of principal parameters are identified. Flexible modifications of the core and sufficiently high fast fluxes for fuel and materials irradiations appear possible.

30742 (DOE/CL/98004—33) Properties of concrete at elevated temperatures. Burrow, R.C.; Griswold, G.D.; Oland, C.B. (Burns and Roe, Inc., Oradell, NJ (USA). Breeder Reactor Div.; Burns and Roe, Inc., Oak Ridge, TN (USA); Oak Ridge National Lab., TN (USA)). 1979. Contract AC15-76CL98004. 5p. (CONF-7909281—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85009002.

From 3. American Society of Civil Engineers/EMD specialty conference; Austin, TX, USA (17 Sep 1979).

This paper describes the ongoing testing program developed to determine the variations in the physical (thermal) and mechanical (strength) properties of limestone aggregate structural concrete, and the physical (thermal) properties of perlite insulating concrete exposed to sustained elevated temperatures up to 621°C (1150°F). The testing program developed by Burns and Roe, Inc. and Oak Ridge National Laboratory is formulated to identify the behavioral trends from the effects of elevated temperature on the mechanical properties of unconfined compressive strength, shear strength, reinforcing bar bond strength, sustained loading (creep) behavior, and the physical properties of thermal expansion, conductivity and diffusivity.

30743 (INIS-mf—9424) German SNQ-project and its research options. Bauer, G.S. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)). Jun 1983. 20p. (CONF-8306262—2). NTIS (US Sales Only), PC A02/MF A01. File Number DE85780936.

From Belgian Nuclear Society annual meeting on advanced uses of accelerators on the nuclear fuel cycle; Brussels, Belgium (13 Jun 1983).

Some of the current ideas of applying accelerators in the nuclear fuel cycle for fuel breeding and waste management are reviewed with respect to physics feasibility and energy efficiency. While fertile-to-fissile conversion and actinide burning seem possible from a physics and energy economy point of view, fission product transmutation is more difficult to assess. R+D-work required for a more detailed assessment and a design study that could be used in an overall systems analysis is briefly summarized. A short description of the German project for a high power spallation neutron source is given and further possible fields of research at the facility are outlined. (AF).

30744 (ORNL—6154) Characterization of modified 9 Cr-1 Mo steel extruded pipe. Sikka, V.K.; Hart, M.D. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 30p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012056.

The fabrication of hot-extruded pipe of modified 9 Cr-1 Mo steel at Cameron Iron Works is described. The report also deals with the tempering response; tensile, Charpy impact, and creep properties; and microstructure of the hot-extruded pipe. The tensile properties of the pipe are compared with the average and average - 1.65 standard error of estimate curves for various product forms of several commercial heats of this alloy. The creep-rupture properties are compared with the average curve for various product forms of the commercial heats.

30745 (RRC—53) Fuel-cladding chemical interaction in mixed oxide liquid metal fast breeder reactors: a review. Khanna, A.S. (Reactor Research Centre, Kalpakkam (India)). 1982. 33p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85900954.

Fuel-clad chemical interaction is one of the important areas of concrn in the fast breeder technology. In this report, an attempt has been made to review the various aspects of this phenomenon. The report summarizes the results from post-irradiation examination, inpile and out of pile experiments which have been reported in the literature and discusses the present understanding of these complex phenomenon in terms of various models proposed so far. A brief introduction is also given on various ways of combating fuel-clad chemical interaction. In the end a few recommendations are made on the possible areas of future investigations.

30746 (RRC—56) Activity report of Reactor Engineering Laboratory, 1981. Veerasamy, R. (ed.). (Reactor Research Centre, Kalpakkam (India)). 1982. 58p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85900957.

This report summarizes activities concerning the R and D as well as Prototype Testing initiated or continued during 1981 at the Reactor Engineering Laboratory. Considerable work was carried out in connection with prototype testing of components in support of the Fast Breeder Test Reactor which is under construction. This includes mainly calibration of permanent magnet flowmeters in sodium, tests on Control Rod Drive Mechanisms in hot argon and determination of response time of Core Thermocouples. Similarly, work was initiated in advanced instrumentation for sodium cooled reactors. This is concerned with development of noise analysis techniques for detection of sub-assembly faults by means of acoustic and thermal noise. Work in the area of ultrasonic viewing technique was also started and significant progress in constructing suitable probe for viewing in sodium has been achieved. Design work for the large sodium pump for the proposed prototype Fast Breeder Reactor has progressed well and the reference concept has been selected.

30747 (RRC—61) Analysis of ZPR-9 Assembly 31, the Advanced Fuels Program Carbide: Benchmark Critical Assembly. Ganesan, S.; Ramanadhan, M.M.; Gopalakrishnan, V. (Reactor Research Centre, Kalpakkam (India). Fast Reactor Group). 1983. 22p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85900951.

The analysis of the 1000 litre (core) sized carbide benchmark fast reactor assembly using the RRC non adjusted multigroup set and the adjusted French 1969 set shows no surprising results as compared to our predictional capability for oxide cores. This note documents the details of analysis performed for this carbide ZPR-9 Assembly 31. The results for central worths agree with those reported by US team using ENDF/B-IV set and also show that non adjusted set may not be satisfactory in prediction of central worths of materials. On the other hand, the K/sub eff/ is best predicted by the non adjusted ENDF/B-IV based RRC set and the ratio of fission reaction rates are predicted to the same extent by the two sets available at RRC.

30748 (RRC—63) Heat to heat variations in the creep rupture strength of a modified AISI 316 grade stainless steel. Mathew, M.D.; Mannan, S.L.; Ray, S.K.; Rodriguez, P. (Reactor Research Centre, Kalpakkam (India)). 1984. 19p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85900997.

A modified AISI 316 grade stainless steel has been used as the construction material for a large number of structural and core components for the Fast Breeder Test Reactor. The creep rupture properties of this material belonging to these different heats have been studied at temperatures of 823, 873 and 923 K in the stress range of 120 to 300 MPa for test durations upto 60,000 hours. Considerable variations in the creep rupture strength were observed from one heat to another, at all the three temperatures. The scaling of applied stress with the ultimate tensile strength at the corresponding temperatures, however, reduced the heat-to-heat variations to some extent. The heat-to-heat variations are attributed to differences in the amount of interstitial solutes in the steel as well as in grain size.

30749 **Thermo-mechanical analysis of concrete in LMFBR programs.** Marchertas, A.H. (Argonne National Lab., IL (USA). Reactor Analysis and Safety Div.). *Nuclear Engineering and Design;* **82**: No. 1, 47-62(Oct 1984). (CONF-830864—).

From 4. international seminar on fluid/structure dynamics and containment of nuclear reactors; Chicago, IL, USA (29 Aug 1983).

The R and D program described in this paper represents the structural mechanics effort underway and planned at ANL as an attempt to better understand the behavior of concrete structures in LMFBR plants where such structures are subjected to high temperature levels. This paper describes the analytical tools formulated and incorporated into the thermo-mechanical computer code called TEMP-STRESS. Emphasis in this paper is placed on describing the short-time and long-time constitutive formulation for concrete. The primary constitutive relation uses an elasto-plastic technique to simulate concrete nonlinearities, utilizes the von Mises ellipsoid as the loading surface, and assumes a four-parameter failure surface. Post-failure treatment is different when considering surface elements as opposed to internal elements. Creep of the concrete at temperatures up to about 400°C is approximated by a rate-type creep law using Maxwell chain technique. The creep model accounts for moisture and pore pressure disposition of the concrete.

30750 **Fast reactor power plant design having heat pipe heat exchanger.** Huebotter, P.R.; McLennan, G.A. (to Dept. of Energy). US Patent Application 6-645-654. 30 Aug 1984. 15p. Contract W-31-109-ENG-38.

The invention relates to a pool-type fission reactor power plant design having a reactor vessel containing a primary coolant (such as liquid sodium), and a steam expansion device powered by a pressurized water/steam coolant system. Heat pipe means are disposed between the primary and water coolants to complete the heat transfer therebetween. The heat pipes are vertically oriented, penetrating the reactor deck and being directly submerged in the primary coolant. A U-tube or line passes through each heat pipe, extended over most of the length of the heat pipe and having its walls spaced from but closely proximate to and generally facing the surrounding walls of the heat pipe. The water/steam coolant loop includes each U-tube and the steam expansion device. A heat transfer medium (such as mercury) fills each of the heat pipes. The thermal energy from the primary coolant is transferred to the water coolant by isothermal evaporation-condensation of the heat transfer medium between the heat pipe and U-tube walls, the heat transfer medium moving within the heat pipe primarily transversely between these walls.

2106 Power Reactors, Auxiliary, Mobile, Package, And Transportable

30751 **(DOE/OR/21400—T124) Strategic defense initiative.** Nichols, J.P. (Martin Marietta Energy Systems, Oak Ridge, TN (USA)). 1985. Contract AC05-84OR21400. 17p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012778.

The Engineering Technology Division has a leading role, including that of program management, in a major new programmatic thrust of the Oak Ridge National Laboratory that is in support of the national Strategic Defense Initiative (SDI). It is appropriate for the Laboratory to become significantly involved in the program because several of the most promising SDI technologies are in areas for which ORNL (together with Y-12 and K-25) have strong capabilities and significant resources. The initial ORNL work in support of the SDI program is focused on three technologies in which ORNL has extensive experience and traditionally strong research and development programs: (1) space nuclear power, (2) flywheel energy storage, and (3) neutral particle beams. The space nuclear program will utilize our capabilities in areas such as refractory materials, high-temperature alkali metal systems, shielding, and instrumentation. Space nuclear reactors capable of supplying multi-megawatt levels of electrical power on a continuous and long-term basis are envisioned to be required for a variety of SDI surveillance satellites and space-borne weapons platforms. The feasibility of an alkali metal Rankine power conversion cycle, which has promise of providing high power with a very low system mass, is planned for study.

30752 **(GA-A—17773) SP-100 thermionic technology program annual integrated technical progress report for the period ending September 30, 1984.** Holland, J.W. (ed.). (GA Technologies, Inc., San Diego, CA (USA)). Nov 1984. Contract AC03-84SF11906;AC03-84SF12192;AC03-84SF12193. 228p. NTIS, PC A11/MF A01; 1; GPO Dep. File Number DE85012311.

The thermionic technology program addresses the feasibility issues of a seven-year-life thermionic fuel element (TFE) for the SP-100 Thermionic Reactor Space Power System. These issues relate to the extension of TFE lifetime from three to seven years, one of the SP-100 requirements. The technology to support three-year lifetimes was demonstrated in the earlier TFE development program conducted in the late-1960s and 1970s. Primary life-limiting factors were recognized to be thermionic emitter dimensional increases due to swelling of the nuclear fuel and electrical structural damage from fast neutrons. The 1984-85 technology program is investigating the fueled emitter and insulator lifetime issues, both experimentally and analytically. The goal is to analytically project the lifetime of the fueled emitter and insulator and to experimentally verify these projection methods. In 1984, the efforts were largely devoted to the design and building of fueled emitters for irradiation in 1985, validation of fuel-emitter models, development of irradiation-resistant metal-ceramic seal and sheath insulator, modeling of insulator lifetime, and development of wide-spread, high-performance thermionic converters.

30753 **Aerospace technology and commercial nuclear power.** Grey, J. (ed.). New York, NY; American Institute of Aeronautics and Astronautics (1982). 138p. (CONF-8111227—). American Inst. of Aeronautics and Astronautics, 1633 Broadway, New York, NY 10019. File Number TI85010198. Contract FG01-82NE37887.

From Workshop on aerospace technology and commercial nuclear power; Williamsburg, VA, USA (18 Nov 1981).

The objective of the workshop conference upon which this report is based was to compare the technologies, institutions, and procedures of the aerospace and commercial nuclear power industries, to seek commonalities and contrasts, and to identify the most promising avenues for beneficial transfer of information, technology, and procedures between the two industries. Seven working groups convened at the conference to meet this objective. Their general conclusions are presented. The working group topics included: powerplant deseign; plant safety and operations; powerplant control technology and integration; plant facility construction and standardization; economic and financial analyses; public awareness and understanding; and management of nuclear waste and spent fuel.

2107 Regulation And Licensing

REFER ALSO TO CITATION(S) 30727, 30841, 30844, 30931, 30962, 30966, 30971

30754 **(DEMO—83/3G) Proposal for a quality assurance regulation for nuclear power plants.** Bartzis, J.G. (Democritos Nuclear Research Center, Athens (Greece)). Mar 1983. 28p. (In Greek). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701519.

In the present work an attempt has been made to develop a regulation necessary to implement quality assurance in all phases of a nuclear power plant installation. The present work is considered as a basis towards developing a final regulation for Quality Assurance in Nuclear Power Plants. The proposal is based on the IAEA 50-C-QA Code of Practice.

30755 (DOE/CH/91005—T2) Thorium fuel cycles in light water reactors (NASAP fuel cycle analysis). Monthly project status report, December 1978. Matzie, R.A. (Combustion Engineering, Inc., Windsor, CT (USA)). 10 Jan 1979. Contract AT02-76CH91005. 17p. (COO—2426-164). NTIS, PC A02/MF A01; GPO Dep. File Number DE85004525.

Information is presented concerning the uranium resource utilization improvements in the once-through PWR fuel cycle and the NRC licensing evaluation support.

30756 (DOE/CH/91005—T3) Licensing assessment of extended-burnup fuel. Monthly project status letter, December 1, 1979-December 31, 1979. Matzie, R.A.; Liu, Y. (Combustion Engineering, Inc., Windsor, CT (USA)). Jan 1980. Contract AT02-76CH91005. 12p. (COO—2426-206). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85004524.

The licensing impact of high-burnup fuel in the ex-core fuel cycle steps of transportation, fabrication, and storage has been determined. Fuel performance evaluations and model code verification are presented. Scoping type safety analyses have been performed for a number of design transients and postulated accidents for the five-batch, extended-burnup fuel cycle. Loss-of-coolant accident methods are reviewed.

30757 (EGG-EA—6735) Conformance to Regulatory Guide 1.97, Clinton Power Station, Unit No. 1 (Docket No. 50-461). VanderBeek, R. (EG and G Idaho, Inc., Idaho Falls (USA)). Apr 1985. Contract AC07-76ID01570. 22p. NTIS, PC A02/MF A01 - GPO. File Number TI85011675.

This EG and G Idaho, Inc., report reviews the Clinton Power Station, Unit No. 1 submittal for Regulatory Guide 1.97 and identifies areas of nonconformance. Exceptions to the guidelines are evaluated and those areas where sufficient basis for acceptability is not provided are identified.

30758 (EGG-EA—6848) Conformance to Regulatory Guide 1.97, Millstone Nuclear Power Station, Unit No. 1 (Docket No. 50-245). Udy, A.C. (EG and G Idaho, Inc., Idaho Falls (USA)). Apr 1985. Contract AC07-76ID01570. 19p. NTIS, PC A02/MF A01 - GPO. File Number TI85012318.

This report reviews the submittals for Regulatory Guide 1.97, Revision 2, for Unit No. 1 of the Millstone Nuclear Power Station and identifies areas of nonconformance to the regulatory guide. Exceptions to Regulatory Guide 1.97 are evaluated and those areas where sufficient basis for acceptability is not provided are identified.

30759 (INFO—0083) Atomic Energy Control Board. Modus operandi. Blackman, N.S.; Gummer, W.K. (Atomic Energy Control Board, Ottawa, Ontario (Canada)). Feb 1982. 20p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701282.

This paper has been prepared to provide an overview of the responsibilities and activities of the Atomic Energy Control Board. It is designed to address questions that are often asked concerning the establishment of the Atomic Energy Control Board, its enabling legislation, licensing and compliance activities, federal-provincial relationships, international obligations, and communications with the public.

30760 (NUREG—0040-Vol.9-No.1) Licensee contractor and vendor inspection status report. Quarterly report, January-March 1985. Volume 9, No. 1. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Inspection and Enforcement). May 1985. 219p. NTIS, PC A10/MF A01 - GPO. File Number TI85901494.

This periodical covers the results of inspections performed by the NRC's Vendor Program Branch that have been distributed to the inspected organizations during the period from January 1985 through March 1985. Also included in this issue are the results of certain inspections performed prior to January 1985 that were not included in previous issues of NUREG-0040.

30761 (NUREG—0748-Vol.5-No.3) Operating reactors licensing actions summary. Volume 5, No. 3. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Resource Management). May 1985. 337p. NTIS, PC A15/MF A01 - GPO. File Number TI85901504.

The "Operating Reactors Licensing Actions Summary" is designed to provide the management of the Nuclear Regulatory Commission (NRC) with an overview of licensing actions dealing with operating power and nonpower reactors. These reports utilize data collected from the Division of Licensing in the Office of Nuclear Reactor Regulation and are prepared by the Office of Resource Management.

30762 (NUREG—0936-Vol.4-No.1) NRC Regulatory Agenda. Quarterly report, January-March 1985. Volume 4, No. 1. (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Rules and Records). May 1985. 200p. NTIS, PC A09/MF A01 - GPO. File Number TI85901537.

The Regulatory Agenda is a quarterly compilation of all rules on which the NRC has proposed, or is considering action as well as those on which it has recently completed action, and all petitions for rulemaking which have been received and are pending disposition by the Commission. This report covers the period from January through March, 1985.

30763 (NUREG—1132) Technical specifications: Diablo Canyon Nuclear Power Plant, Unit No. 2 (Docket No. 50-323). Appendix "A" to License No. DPR-81. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). Apr 1985. 464p. NTIS, PC A20/MF A01 - GPO. File Number TI85901439.

Information is presented concerning the limiting conditions for operation for the reactivity control systems, instrumentation, power distribution limits, reactor coolant system, emergency core cooling system, containment systems, plant systems, electrical power systems, refueling operations, special test exceptions, radioactive effluents, and radiological environmental monitoring.

30764 (NUREG—1133) Technical Specifications: Palo Verde Nuclear Generating Station, Unit No. 1 (Docket No. 50-528). Appendix "A" to License No. NPF-41. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). May 1985. 514p. NTIS, PC A22/MF A01 - GPO. File Number TI85901552.

Information on the limiting conditions for operation is presented concerning reactivity control systems, power distribution limits, instrumentation, reactor coolant system, emergency core cooling system, containment systems, plant systems, electrical power systems, refueling operations, special test exceptions, radioactive effluents, and radiological environmental monitoring.

2108 Economics

REFER ALSO TO CITATION(S) 30736

30765 (IWGFPT—20, pp 80-86) **Alternative routes to improved fuel utilization: Analysis of near-term economic incentives.** Salo, J.P. (Industrial Power Company Ltd., Helsinki (Finland)); Vieno, T.; Vira, J. (Nuclear Engineering Lab., Technical Research Centre of Finland, Helsinki (Finland)). Dec 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85900589. (CONF-8405285—).

From IAEA improved utilization of water reactor fuel with special emphasis on extended burnups and plutonium recycling meeting; Mol, Belgium (7 May 1984).

The potential for savings in the nuclear fuel cycle costs is discussed from the point of view of a single utility. The analysis is concentrated on the existing and near-term economic incentives for improved fuel utilization, and the context is that of a small country without domestic fuel cycle services. In the uranium fuel cycle the extended burnup produces savings in the uranium feed as well as in the fuel fabrication and waste management requirements. The front-end fuel cycle cost impact is evaluated for BWRs. In the back-end part the situation is more specific of the concrete back-end solution.

Estimates for savings in the cost of direct disposal of spent fuel are presented for a Finnish case. The economics of recycle is reviewed from a recent study on the use of MOX fuel in the Finnish BWRs. The results from a comparison with once-through alternative show that spent fuel reprocessing with consequent recycle of uranium and plutonium would be economically justified only with very high uranium prices.

30766 (NP—5770191, pp 10.1-10.61) **Effect of scale and quantity on the cost and performance of energy technologies. A literature review.** Hill, D. Jan 1984. NTIS (US Sales Only), PC A16/MF A01. File Number DE85770191.

In Technological development and its impact on the future energy system. Appendix 1. Evaluation commissioned by the Danish Ministry of Energy.

The promise of economies of scale in construction led to a great leap forward in the size of power plants in the U.S. to 1000 MWe or more. Traditionally, a "six-tenths power law" stated that cost increased by only half with a doubling of plant size, reducing cost per unit of capacity to 75%. Problems during construction in the past two decades have largely nullified the expected savings. Thermal efficiency improves with size in both coal and nuclear plants, but there is statistical evidence that plant availability declines. These countervailing trends suggest that an optimal size for nuclear plants may be somewhat less than 1000 MWe. Judged by a study of the cost of electricity generated during the 1970s, however, operational savings substantially restored economies of scale to nuclear plants but not to coal plants. The alternative to building larger plants is to build more small plants. In field construction, a second plant at the same site costs about 90% of the first, and a doubling of the number of plants built by an architect-engineer appears to reduce average cost to about 93%. In the few cases where learning curves are mentioned in manufacturing studies of new energy technologies, however, a reduction in cost to only about 90% with a doubling of quantity is assumed. Most of the cost of new energy technologies such as photovoltaic arrays and fuel cells will be due to conventional equipment, structure, and manufacturing methods. It should therefore be possible to estimate size-quantity cost tradeoffs with some confidence to help establish optimal plant or module sizes.

30767 (NUREG/CR—3626-Vol.2) **Maintenance Personnel Performance Simulation (MAPPS) model: description of model content, structure, and sensitivity testing. Volume 2.** Siegel, A.I.; Bartter, W.D.; Wolf, J.J.; Knee, H.E. (Oak Ridge National Lab., TN (USA); Applied Psychological Services, Inc., Wayne, PA (USA)). Dec 1984. Contract AC05-84OR21400. 318p. (ORNL/TM—9041/V2). NTIS, PC A14/MF A01 - GPO. File Number TI85008300.

This volume of NUREG/CR-3626 presents details of the content, structure, and sensitivity testing of the Maintenance Personnel Performance Simulation (MAPPS) model that was described in summary in volume one of this report. The MAPPS model is a generalized stochastic computer simulation model developed to simulate the performance of maintenance personnel in nuclear power plants. The MAPPS model considers workplace, maintenance technician, motivation, human factors, and task oriented variables to yield predictive information about the effects of these variables on successful maintenance task performance. All major model variables are discussed in detail and their implementation and interactive effects are outlined. The model was examined for disqualifying defects from a number of viewpoints, including sensitivity testing. This examination led to the identification of some minor recalibration efforts which were carried out. These positive results indicate that MAPPS is ready for initial and controlled applications which are in conformity with its purposes.

30768 (NUREG/CR—4206) **Select review of the recent (1979-1983) behavioral research literature on training simulators.** Laughery, K.R. (Micro Analysis and Design, Boulder, CO (USA)). May 1985. Contract AC05-84OR21400. 50p. (ORNL/TM—9445). NTIS, PC A03/MF A01 - GPO. File Number TI85011583.

This report summarizes some selected reports of behavioral research performed in the years 1979 to 1983 on training simulator application technology, and discusses findings related to nuclear power plant operators' simulator training. Findings are organized as related to the design, testing, and use of training simulators. Topics include Simulator Fidelity in Training Effectiveness, Operator Performance Measurement, Measuring Simulator Effectiveness, and Simulator Utilization Practices.

30769 **Estimating the cost of delaying a nuclear power plant: methodology and application.** Hill, L.J.; Tepel, R.C.; Van Dyke, J.W. (Oak Ridge National Lab., TN). *Energy Systems and Policy;* 9: No. 2, 197-216(1985).

This paper presents an analysis of an actual 24-month nuclear power plant licensing delay under alternate assumptions about regulatory practice, sources of replacement power, and the cost of the plant. The analysis focuses on both the delay period and periods subsequent to the delay. The methodology utilized to simulate the impacts involved the recursive interaction of a generation-costing program to estimate fuel-replacement costs and a financial regulatory model to concomitantly determine the impact on the utility, its ratepayers, and security issues. The results indicate that a licensing delay has an adverse impact on the utility's internal generation of funds and financial indicators used to evaluate financial soundness. The direction of impact on electricity rates is contingent on the source of fuel used for replacement power. 5 references, 5 tables.

22 NUCLEAR REACTOR TECHNOLOGY

2201 Theory And Calculation

REFER ALSO TO CITATION(S) 30698, 31746

30770 (BLG—571) **CASSANDRE: a two-dimensional multigroup diffusion code for reactor transients analysis.** Arien, B.; Siebertz, A.; Devooght, J.; Mund, E. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). Sep 1984. 73p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701284.

CASSANDRE is a two-dimensional (x-y or r-z) finite element neutronics code with thermohydraulics feedback for reactor dynamics prior to the dissassembly phase. It uses the multigroup neutron diffusion theory. Its main characteristics are the use of a generalized quasistatic model, the use of a flexible multigroup point-kinetics algorithm allowing for spectral matching and the use of a finite element description. The code was conceived in order to be coupled with any thermohydraulics module, although thermohydraulics feedback is only considered in r-z geometry. In steady state criticality search is possible either by control rod insertion or by homogeneous poisoning of the coolant. This report describes in detail the theoretical developments on which the code is based.

Published in summary form only.

In Research laboratories annual report 1983.

30777 (IC—84/20) **Transformation law for response fluxes within the collision probability method.** Wio, H.S. (International Centre for Theoretical Physics, Trieste (Italy)). Mar 1984. 10p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701285.

By means of Takahashi's transformation law connecting two collision probability matrices of the same subregion division but with different cross-sections, a new transformation law connecting the corresponding response flux matrices has been found.

30778 (LA-UR—85-1730) **Application of evaluated fission-product delayed-neutron precursor data in reactor kinetics calculations.** Perry, R.T.; Wilson, W.B.; England, T.R.; Brady, M.C. (Los Alamos National Lab., NM (USA); Texas A and M Univ., College Station (USA)). 1985. Contract W-7405-ENG-36. 5p. (CONF-850507—17). NTIS, PC A02/MF A01; GPO Dep. File Number DE85012728.

From International conference on nuclear data for basic and applied science; Santa Fe, NM, USA (13 May 1985).

Evaluated fission-product yield and decay data have been used to describe 105 delayed neutron precursors explicitly in point reactor kinetics calculations. Results calculated for ^{235}U thermal fission show that rod-drop reactivity values obtained from kinetics calculations with 6-group precursor data are considerably higher than those calculated with explicit delayed-neutron precursor data. The calculated kinetics associated with positive reactivity steps are significantly different.

30779 (NRCN—536) **Core design and operation optimization methods based on time-dependent perturbation theory.** Greenspan, E. (Israel Atomic Energy Commission, Beersheba. Nuclear Research Center-Negev). Aug 1983. 44p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701488.

A general approach for the optimization of nuclear reactor core design and operation is outlined; it is based on two cornerstones: a newly developed time-dependent (or burnup-dependent) perturbation theory for nonlinear problems and a succesive iteration technique. The resulting approach is capable of handling realistic reactor models using computational methods of any degree of sophistication desired, while accounting for all the constraints imposed. Three general optimization strategies, different in the way for handling the constraints, are formulated.

30780 (NUREG/CR—0200-Vol.1) **SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 1. Control modules.** (Oak Ridge National Lab., TN (USA)). Dec 1984. Contract AC05-84OR21400. 835p. (ORNL/NUREG/CSD—2/Vol.1). NTIS, PC A99/MF A01 - GPO. File Number TI85007563.

This manual provides documentation for a new, multi-faceted computational system called SCALE (Standardized Computer Analyses for Licensing Evaluation) that has been developed to provide a standard analysis tool for use by the NRC staff and licensees in evaluating nuclear fuel facility and package designs. The SCALE system consists of several automated analytical sequences (control modules) which perform criticality, shielding, and/or heat transfer calculations with a minimum of user-required input. The computer codes (functional modules) used within each analytical sequence can also be run in a stand-alone fashion or coupled together in a sequence determined by the user. Volume 1 describes the following control modules: a one-dimensional criticality safety analysis module; an enhanced criticality safety analysis module with an optimum pitch search option; a coupled one-dimensional depletion and shielding analysis module; an automated Monte Carlo shielding analysis module; and a two-dimensional heat transfer analysis of fuel casks. Separate abstracts are provided for each control module description.

30781 (NUREG/CR—0200-Vol.1, pp vp, Section C1) **CSAS1: a one-dimensional criticality safety analysis module.** Bucholz, J.A. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007563. (ORNL/NUREG/CSD—2/Vol.1). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 1. Control modules.

Under contract with the Nuclear Regulatory Commission, the Computer Sciences Division at Oak Ridge National Laboratory has developed the SCALE system for performing Standardized Computer Analyses for Licensing Evaluation of nuclear systems. The SCALE system includes a number of selected data libraries as well as various calculational modules for performing criticality, shielding and heat transfer analyses. This document describes the CSAS1 control module which shields the group-averaged cross-section data for the given situation and performs a one-dimensional discrete ordinates calculation to obtain the effective neutron multiplication factor (k-eff) for the configuration described by the user. Subsections are: introduction, program flow, input, sample problems, and error messages.

30782 (NUREG/CR—0200-Vol.1, pp vp, Section C2) **CSAS2: a multidimensional criticality safety analysis module.** Bucholz, J.A. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007563. (ORNL/NUREG/CSD—2/Vol.1). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 1. Control modules.

Under contract with the Nuclear Regulatory Commission, the Computer Sciences Division at Oak Ridge National Laboratory has developed the SCALE system for performing Standardized Computer Analyses for Licensing Evaluation of nuclear systems. The SCALE system includes a number of selected data libraries as well as various calculational modules for performing criticality, shielding and heat transfer analyses. This document describes the CSAS2 control module which shields the group-averaged cross-section data for the given situation and performs a multidimensional Monte Carlo calculation to obtain the effective neutron multiplication factor (k-eff) for the configuration described by the user. Subsections are: introduction, program flow, input, sample problems, and error messages.

30783 (NUREG/CR—0200-Vol.1, pp vp, Section 4) **CSAS4: an enhanced criticality safety analysis module with an optimum pitch search option.** Landers, N.F.; Petrie, L.M. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007563. (ORNL/NUREG/CSD—2/Vol.1).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 1. Control modules.

CSAS4 and CSAS4X were developed to provide an optimum pitch search capability for three-dimensional problems in the SCALE system. They have been upgraded to increase their search capabilities and to interface with KENO V.a rather than KENO V. This expands the geometrical capabilities to allow arrays of arrays, holes, variable chords for hemicylinders and hemispheres, and inline printer plots. Several control sequences are available within the CSAS4-CSAS4X family. These control sequences activate the cross-section processing codes BONAMI-S and NITAWL-S to provide resonance-corrected cross sections. Control modules ending with X utilize XSDRNPM-S to provide a cell-weighted mixture cross section. ICE-S is used by CSASI and CSASIX to provide a Monte Carlo formatted mixed cross-section library. KENO V.a is used to calculate the effective neutron multiplication factor (k-effective) of the system. The search capability is achieved by repeatedly activating the modules MODIFY to alter the pitch or other dimensions and KENO V.a to calculate the k-effective for the new pitch or dimensions. The control sequences described within this document were developed simultaneously and are closely related. Subsections are: introduction/theory, program flow, input/output, error messages, and sample problems.

30784 (NUREG/CR—0200-Vol.1, pp vp, Section S3) **SAS3: an automated Monte Carlo shielding analysis module.** West, J.T. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007563. (ORNL/NUREG/CSD—2/Vol.1). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 1. Control modules.

SCALE SAS3 is the SCALE Shielding Analytical Sequence for three-dimensional geometry problems. The system incorporates the simple input processor found in CSAS1 with the radiation transport capabilities of the MORSE-SGC/S Monte Carlo code. This allows automated Nordheim resonance correction processing with the three-dimensional geometry features of the new combinatorial MARS (Multiple Array System). The system executes in sequence, the SAS3 Input Processor, BONAMI-S, NITAWL-S, XSDRNPM-S (optionally), ICE-S, and the MORSE-SGC/S codes. Subsections are: introduction, program flow, input, and sample problem.

30785 **(NUREG/CR—0200-Vol.2) SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.** (Oak Ridge National Lab., TN (USA)). Dec 1984. Contract AC05-84OR21400. 1747p. (ORNL/NUREG/CSD—2/Vol.2). NTIS, PC A99/MF A01 - GPO. File Number TI85007576.

This manual provides documentation for a new multi-faceted computational system called SCALE (Standardized Computer Analyses for Licensing Evaluation) that has been developed to provide a standard analysis tool for use by the NRC staff and licensees in evaluating nuclear facilities and package designs. Volume 2 describes the computer codes (functional modules) used within the criticality, shielding, and heat transfer calculation control modules. Separate abstracts are provided for the functional modules available: resonance self-shielding by the Bondarenko method; resonance self-shielding by the Nordheim method; a one-dimensional discrete-ordinates program for transport analysis; calculation of fluxes and dose rates outside a shield; improved Monte Carlo criticality program; processing of problem-dependent cross sections and neutron spectral data; calculation of fuel depletion, transmutation, fission product buildup and decay; mixing of multigroup cross sections; neutron and photon Monte Carlo transport analyses (advanced geometry); heat conduction (finite difference formulation); 3-D geometry plotting program; temperature distribution plotting programs; and plotting program to verify heat transfer input data.

30786 (NUREG/CR—0200-Vol.2, pp vp, Section F1) **BONAMI-S: resonance self-shielding by the Bondarenko method.** Greene, N.M. Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

BONAMI-S is a module of the SCALE system which is used to perform Bondarenko calculations for resonance self-shielding. Cross sections and Bondarenko factor data are input from an AMPX master library. The output is written as an AMPX master library. A wide variety of options is provided for different lattices and cell geometries through the use of Dancoff approximations. A novel interpolational scheme is used which avoids many of the problems of the widely employed Lagrangian schemes.

30787 (NUREG/CR—0200-Vol.2, pp vp, Section F2) **NITAWL-S: scale system module for performing resonance shielding and working library production.** Westfall, R.M.; Petrie, L.M.; Greene, N.M.; Lucius, J.L. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

NITAWL-S is a module that is required by many calculational sequences in the SCALE system. Its major function is to collect data from up to three input cross section libraries and to process, reformat, and write the information onto a working library for use in a transport calculation. It can also serve as a production resonance calculation module for those nuclides which have resonance parameters included in their basic cross section data. In this case, the Nordheim Integral treatment and a simplified unresolved treatment are employed. This document describes the resonance theory, all numerical procedures, the computer related requirements and the input and output of NITAWL-S.

30788 (NUREG/CR—0200-Vol.2, pp vp, Section F3) **XSDRNPM-S: a one-dimensional discrete-ordinates code for transport analysis.** Greene, N.M.; Petrie, L.M. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

XSDRNPM-S is a discrete ordinates code which solves the one-dimensional Boltzmann equation in slab, cylindrical or spherical coordinates. Alternately, the user can select P_1 diffusion theory, infinite medium theory or B/sub n/ theory. A variety of calculational types are available, including fixed source, eigenvalue, or search calculations. In SCALE XSDRNPM-S is used for several purposes: eigenvalue (k-effective) determination, cross section collapsing, shielding analysis, and for producing bias-factors for use in Monte Carlo shielding calculations.

30789 (NUREG/CR—0200-Vol.2, pp vp, Section F4) **XSDOSE: a module for calculating fluxes and dose rates at points outside a shield.** Bucholz, J.A. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

Under contract with the Nuclear Regulatory Commission, the Computer Sciences Division at Oak Ridge National Laboratory has developed the SCALE system for performing Standardized Computer Analyses for Licensing Evaluation of nuclear systems. The SCALE system includes a number of selected data libraries as well as various calculational modules for performing criticality, shielding and heat transfer analyses. This document describes the XSDOSE code which is used in conjunction with XSDRNPM to compute the neutron/gamma flux and the resulting dose at various points outside a finite cylinder or sphere. It may also be used to compute the flux and/or dose at various points due to a finite rectangular surface source or a circular disc. The code assumes that the outgoing angular flux distribution on the rectangle, cylinder, sphere, or disc is independent of position and that the surrounding media is a void. Unlike previous codes, the numerical technique employed in XSDOSE is suitable for points on, close to, or far from the source.

30790 (NUREG/CR—0200-Vol.2, pp vp, Section F5) **KENO IV/S: an improved Monte Carlo criticality program.** Petrie, L.M.; Landers, N.F. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

KENO IV is a multigroup Monte Carlo criticality program written for the IBM 360 computers. It executes rapidly and is flexibly dimensioned so the allowed size of a problem (i.e., the number of energy groups, number of geometry cards, etc., is arbitrary) is limited only by the total data storage required. The input data, with the exception of cross sections, fission spectra and albedos, may be entered in free form. The geometry input is quite simple to prepare and complicated three-dimensional systems can often be described with a minimum of effort. The results calculated by KENO IV include k-effective, lifetime and generation time, energy-dependent leakages and absorptions, energy- and region-dependent fluxes and region-dependent fission densities. Criticality searches can be made on unit dimensions or on the number of units in an array. This report includes a summary of the theory utilized by KENO IV, a section describing the logical program flow, a compilation of the error messages printed by the code and a comprehensive data guide for preparing input to the code.

30791 (NUREG/CR—0200-Vol.2, pp vp, Section F6) **COUPLE: SCALE system module to process problem-dependent cross sections and neutron spectral data for ORIGEN-S analyses.** Hermann, O.W. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

The COUPLE Code automatically couples problem-dependent cross sections constants and flux weighting factors into libraries input to ORIGEN-S, for performing calculations of nuclear reactor isotope depletion and generation inventories and their associated sources and afterheats. In effect, the technique permits ORIGEN-S to apply multi-energy-group neutron cross section data. The chief input required by COUPLE is simply a Working Library produced directly by the AMPX code system or the SCALE code system from neutronics analyses computed by BONAMI-S, NITAWL-S and XSDRNPM-S. Also, any of the nuclear data contained in ORIGEN-S Binary Libraries may be updated by the code. The COUPLE Code is one of the functional modules executed by the SAS2 Control Module of the SCALE code system. Subsections are: introduction, theory, program structure, input, and sample problems.

30792 (NUREG/CR—0200-Vol.2, pp vp, Section F7) **ORIGEN-S: SCALE system module to calculate fuel depletion, actinide transmutation, fission product buildup and decay, and associated radiation source terms.** Hermann, O.W.; Westfall, R.M. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

ORIGEN-S computes time-dependent concentrations and source terms of a large number of isotopes, which are simultaneously generated or depleted through neutronic transmutation, fission, radioactive decay, input feed rates and physical or chemical removal rates. The calculations may pertain to fuel irradiation within nuclear reactors, or the storage, management, transportation or subsequent chemical processing of removed fuel elements. The matrix exponential expansion model of the ORIGEN code is unaltered in ORIGEN-S. Essentially all features of ORIGEN were retained, expanded or supplemented within new computations. The primary objective of ORIGEN-S, as requested by the Nuclear Regulatory Commission, is that the calculations may utilize the multi-energy-group cross sections from any currently processed standardized ENDF/B data base. This purpose has been implemented through the prior execution of codes within either the SCALE System or the AMPX System, developed at the Oak Ridge National Laboratory. These codes compute flux-weighted cross sections, simulating conditions within any given reactor fuel assembly, and convert the data into a library that can be input to ORIGEN-S. Time-dependent libraries may be produced, reflecting fuel composition variations during irradiation. Presented in the document are: detailed and condensed input instructions, model theory, features available, range of applicability, brief subroutine descriptions, sample input, and I/O requirements.

30793 (NUREG/CR—0200-Vol.2, pp vp, Section F8) **ICE-S: module to mix multigroup cross sections.** Greene, N.M.; Petrie, L.M.; Fraley, S.K. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

ICE-S is a cross-section mixing code which will accept cross sections from an AMPX working library and produce mixed cross sections in the AMPX working library format, ANISN format, the group-independent ANISN format and the Monte Carlo processed cross section library format. User input is in the free-form or fixed-form FIDO structure. The code is also operable as a module in the AMPX system. Subsections are: introduction, theory, program description, input, and sample problems.

30794 (NUREG/CR—0200-Vol.2, pp vp, Section F9) **MORSE-SGC/S for the SCALE system.** West, J.T.; Hoffman, T.J.; Emmett, M.B. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

MORSE-SGC/S is the SCALE version of the MORSE-SGC code. This new version contains the supergroup cross-section storage and tracking feature of MORSE-SGC, along with a new improved geometry system (MARS, Multiple ArRay System) for nested rectangular array analysis. MROSE-SGC/S is written to solve a wide variety of shielding and criticality problems without user-required subroutines. Subsections are: introduction, theory, input, program description, and sample problems.

30795 (NUREG/CR—0200-Vol.2, pp vp, Section F11) **KENO V.a: an improved Monte Carlo criticality program with supergrouping.** Petrie, L.M.; Landers, N.F. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A99/MF A01. File Number TI85007576. (ORNL/NUREG/CSD—2/Vol.2).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 2. Functional modules.

KENO V.a is an extension of the KENO-V Monte Carlo criticality program and was developed for use in the SCALE system. In addition to the features available in KENO V, KENO V.a offers versatile new geometry capabilities and in-line printer plots of the geometry. The new geometry features include (1) the array of arrays option, (2) the holes option, and (3) variable chords for hemicylinders and hemispheres. The array of arrays options allows arrays to be built of other arrays and nested to any depth, subject to the availability of sufficient computer memory. The holes option allows the placement of one or more geometry regions within other geometry regions. The depth of hole nesting is limited only be the availability of sufficient computer memory. The variable chords option allows a hemisphere or hemicylinder to be as small as non-existent or as large as a full sphere or cylinder, or any size in between. The primary purpose of KENO V.a is to determine k-effective. Other calculated quantities include lifetime and generation time, energy-dependent leakages, energy- and region-dependent absorptions, fissions, fluxes, and fission densities. KENO V.a retains the KENO V features. This advanced user-oriented program features simplified data input and efficient use of computer storage.

30796 (NUREG/CR—0200-Vol.3) **SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 3. Miscellaneous.** (Oak Ridge National Lab., TN (USA)). Dec 1984. Contract AC05-84OR21400. 493p. (ORNL/NUREG/CSD—2/Vol.3). NTIS, PC A21/MF A01 - GPO. File Number TI85007581.

This manual provides documentation for a new, multi-faceted computational system called SCALE (Standardized Computer Analyses for Licensing Evaluation) that has been developed to provide a standard analysis tool for use by the NRC staff and licensees in evaluating nuclear fuel facility and package designs. The SCALE system consists of several automated analytical sequences (control modules) which perform criticality, shielding, and/or heat transfer calculations with a minimum of user-required input. The computer codes (functional modules) used within each analytical sequence can also be run in a stand-alone fashion or coupled together in a sequence determined by the user. Volume 3 describes various libraries, input systems, and guides for use with the SCALE System; separate abstracts are provided for each.

30797 (NUREG/CR—0200-Vol.3, pp vp, Section M2) **SCALE system driver.** Petrie, L.M. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A21/MF A01 - GPO. File Number TI85007581. (ORNL/NUREG/CSD—2/Vol.3). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 3. Miscellaneous.

The SCALE driver was designed to allow implementation of a modular code system consisting of control modules, which determine the calculation path, and functional modules, which perform the basic calculations. The user can either select a control module and have that module determine the execution path, or the user can select functional modules directly by input.

30798 (NUREG/CR—0200-Vol.3, pp vp, Section M2) **SCALE subroutine library.** Petrie, L.M. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A21/MF A01 - GPO. File Number TI85007581. (ORNL/NUREG/CSD—2/Vol.3). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 3. Miscellaneous.

The SCALE subroutine library is a collection of subroutines, each of which performs a function which may be useful to more than a single program. These subroutines have been collected into a library so that a program can easily access those it needs. In the description that follows the calling sequence, a brief description of the function, a brief description of the arguments, and the programming language used for each subroutine in the library is given. This section is written from the point of view of aiding a programmer in using these subroutines in a program.

30799 (NUREG/CR—0200-Vol.3, pp vp, Section M3) **SCALE free-form reading routines.** Petrie, L.M. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A21/MF A01 - GPO. File Number TI85007581. (ORNL/NUREG/CSD—2/Vol.3). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 3. Miscellaneous.

A set of free-form data reading routines has been developed to facilitate the use of free-formatted data input. These routines are used by the control programs to read the standard composition data and related data. Some of the functional modules such as KENO V and HEATING6 also make extensive use of these routines. This document is intended to provide guidance to a programmer desiring to use these routines in a program. Section M3.2 explains the conventions used to input data, and Section M3.3 contains information necessary for a programmer to use the routines.

30800 (NUREG/CR—0200-Vol.3, pp vp, Section M8) **Standard composition library.** Bucholz, J.A.; Knight, J.R.; Parks, C.V.; Petrie, L.M.; Turner, J.C.; Westfall, R.M. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A21/MF A01 - GPO. File Number TI85007581. (ORNL/NUREG/CSD—2/Vol.3).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 3. Miscellaneous.

The Standard Composition Library has been included within the SCALE system to provide the user with a simple and straightforward method of specifying the material mixtures for a given problem. The library consists of over 200 mixtures and isotopes commonly used within shielding and criticality problems. This library is tabulated in Section M8.2 with the various features of each composition. Additionally, a number of standard fissile solutions available for use are tabulated in Section M8.3. The user is also able to specify the isotopic distribution of boron, uranium, or plutonium by using the table provided in Section M8.4.

30801 (NUREG/CR—0200-Vol.3, pp vp, Section M9) **MARS: a multiple array system using combinatorial geometry.** West, J.T.; Emmett, M.B. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A21/MF A01 - GPO. File Number TI85007581. (ORNL/NUREG/CSD—2/Vol.3).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 3. Miscellaneous.

MARS is a combinatorial geometry method for modeling a Multiple ARray System. It allows the user the ability to model many unique rectangular arrays with unlimited array nesting. In this system, arrays may contain arbitrary vacancies and may be arbitrarily positioned in space. Geometry may be modeled around an array and optionally repeated with the array. Array repetition and array nesting does not require additional computer memory, hence MARS can model very complicated geometry systems with a minimum of computer memory requirements.

30802 (NUREG/CR—0200-Vol.3, pp vp, Section M10) **FIDO input system.** Petrie, L.M. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A21/MF A01 - GPO. File Number TI85007581. (ORNL/NUREG/CSD—2/Vol.3). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 3. Miscellaneous.

This document provides a description of the FIDO input system being used in conjunction with several SCALE functional modules. The FIDO system is a widely used method of entering or modifying large data arrays with minimum effort. Special advantage is taken of patterns of repetition or symmetry whenever possible.

30803 (NUREG/CR—0200-Vol.3, pp vp, Section M11) **SCALE interactive input processor.** Knight, J.R. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A21/MF A01 - GPO. File Number TI85007581. (ORNL/NUREG/CSD—2/Vol.3). Contract W-7405-ENG-26.

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 3. Miscellaneous.

The purpose of the SCALE Interactive Input Processor is to assist the user who wishes to enter the data needed to run a job from a terminal connected to the DEC-10 computer at Oak Ridge National Laboratory. Prompting messages for each section of data are followed by an opportunity to reenter the data if errors are found. Section M11.2 lists the subroutine names and briefly describes the purpose of each one. Section M11.3 lists the prompting messages and gives a description of the expected user response following each message. Section M11.4 describes how a problem is submitted for execution when all of the data has been entered.

30804 (NUREG/CR—0200-Vol.3, pp vp, Section M12) **CESAR: a criticality experiment storage and retrieval program.** Knight, J.R.; Westfall, R.M. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A21/MF A01 - GPO. File Number TI85007581. (ORNL/NUREG/CSD—2/Vol.3).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 3. Miscellaneous.

CESAR is a program for storing and retrieving input data for criticality calculations using the SCALE system. Each problem consists of a problem description and an input data set to run the problem. Editing and updating features are described. As of January 1984, 447 experiments were included in the CESAR library.

30805 (NUREG/CR—0200-Vol.3, pp vp, Section M13) **PICTURE: a printer plot package for making 2-D pictures of MARS geometries.** Emmett, M.B. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A21/MF A01 - GPO. File Number TI85007581. (ORNL/NUREG/CSD—2/Vol.3).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 3. Miscellaneous.

The PICTURE program was written to provide aid in preparing correct input data for the MARS geometry package which is a multiple array system using combinatorial geometry. It provides a printed view of arbitrary two-dimensional slices through the geometry. By inspecting these pictures one may determine if the geometry specified by the input cards is indeed the desired geometry. This report describes PICTURE, its options, and input.

30806 (NUREG/CR—0200-Vol.3, pp vp, Section M14) **COMPOZ data guide.** Knight, J.R. (Oak Ridge National Lab., TN). Dec 1984. NTIS, PC A21/MF A01 - GPO. File Number TI85007581. (ORNL/NUREG/CSD—2/Vol.3).

In SCALE: a modular code system for performing standardized computer analyses for licensing evaluation. Volume 3. Miscellaneous.

The COMPOZ Data Guide used to create the Standard Composition Library is described. Of particular importance is documentation of the COMPOZ input data file structure. Knowledge of the file structure allows users to edit the data file and subsequently create their own site-specific composition library.

30807 **(RRC—57) Variational-modal expansion method for space-time kinetics.** Srinivasan, L. (Reactor Research Centre, Kalpakkam (India)). 1982. 18p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85900958.

A new numerical approach has been developed to solve the time dependent multi-group diffusion equation using variational-modal expansion method. In this method the neutron flux is expanded in series with the time part in the form of an exponential which is derived from the solution of space-time diffusion equations by iterative techniques. For the space part the variational approach is used to get an appropriate functional and by integration over the spatial co-ordinates, a set of algebraic equations are derived from which the solution could be obtained. A sample problem in one-dimensional slab geometry has proved the efficiency of the method.

30808 **(RRC—58) Activity report of Reactor Physics Section, 1982.** Reddy, C.P. (ed.). (Reactor Research Centre, Kalpakkam (India)). 1983. 91p. NTIS (US Sales Only), PC A05/MF A01. File Number DE85900959.

With the commissioning of Honeywell-DPS-8 computer system at RRC during March 1982, all the computer codes earlier being run on the IBM-370 computer at IIT, Madras, were adapted and tested on the local computer. In addition to the work reported in the sections on Nuclear Data, Fast Reactor Design Studies, Safety Analysis and Shielding Design, a new section on Reactor Noise Analysis has been added in this report to bring out the detailed studies taken up in this area. A national Workshop on Reactor Noise Analysis is being organized during February 23-24, 1983 at Reactor Research Centre to bring together active workers in this area, from various laboratories. Some of the studies in Statistical Physics which will find applications in Monte Carlo Techniques being developed in our group are also reported in a separate section. A list of publications made by the members of the section, along with the staff chart of the Reactor Physics Section are given at the end of this report.

30809 **(RRC—64) Activity report of Reactor Physics Section, 1983.** Murthy, K.P.N. (ed.). (Reactor Research Centre, Kalpakkam (India)). 1984. 120p. NTIS (US Sales Only), PC A06/MF A01. File Number DE85900952.

The preliminary physics design of a 500 MWe, Prototype Fast Breeder Reactor (PFBR) including the neutronics, shielding and safety analysis was completed during this year and the results have been incorporated in the Preliminary Feasibility and Design Report for PFBR. Neutronics studies of a small carbide fuelled core and nominal carbide core were also carried out during this period. The 36 contributions included in this report cover the different activities viz. Nuclear Data Processing and Testing, Reactor Theory, Design and Analysis, Reactor Kinetics and Safety Analysis, Reactor Noise Analysis, Radiation Transport and Shielding; and Statistical Physics. It is evident from the above contributions that the activities of the section are oriented not only towards the nuclear design needs of FBTR and PFBR, but also in studying some of the current problems in Reactor Theory, Radiation Transport, Reactor Safety, etc. A laboratory for reactor physics and shielding experiments is being set up for FBTR and PFBR.

30810 **(AECL—8190) Analysis of flow-induced vibration of heat exchanger and steam generator tube bundles using the AECL computer code PIPEAU-2.** Gorman, D.J. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Dec 1983. 10p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701241.

PIPEAU-2 is a computer code developed at the Chalk River Nuclear Laboratories for the flow-induced vibration analysis of heat exchanger and steam generator tube bundles. It can perform this analysis for straight and 'U' tubes. All the theoretical work underlying the code is analytical rather than numerical in nature. Highly accurate evaluation of the free vibration frequencies and mode shapes is therefore obtained. Using the latest experimentally determined parameters available, the free vibration analysis is followed by a forced vibration analysis. Tube response due to fluid turbulence and vortex shedding is determined, as well as critical fluid velocity associated with fluid-elastic instability.

30811 **(CEA-CONF—7537) Qualification rules of important electrical equipments for safety.** Le Meur, M.; Henry, J.Y. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete). May 1984. 13p. (In French). (CONF-840516—9; DAS—82). NTIS (US Sales Only), PC A02/MF A01. File Number DE85751315.

From International symposium on aging in tests of safety equipment for nuclear power plants; Paris, France (15 May 1984).

This presentation defines different categories of safety related electrical equipments and the correspondant qualification test programs.

30812 (IAEA-TC—427/5, pp 216-223) **Transition from single-phase forced convection to fully developed boiling.** Maroti, L. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

An advanced computer code for the complete analysis of a complex thermal-hydraulic system should be capable to calculate a number of heat transfer regimes. The correlations for the calculation of wall heat transfer do not perfectly predict the true physical process and they cannot ensure smooth transition at the boundaries of the individual regimes of heat transfer. It often happens that expressions for two adjacent regions supply different values for the heat transfer coefficient at the boundary. The discontinuity of the wall heat transfer functions can easily lead to numerical problems or result in inaccuracy of the calculations. Examples are given of how the problem of wall heat transfer is handled in some widely used codes (TRAC, DRUFAN, RELAP5) and a new solution is explained for the case of partial boiling heat transfer which ensures smooth transition at the boundaries.

30813 (NUREG/CR—3855-6-84) **Characterization of nuclear reactor containment penetrations. Preliminary report.** Bump, T.R.; Seidensticker, R.W.; Shackelford, M.A.; Gambhir, V.K.; McLennan, G.L. (Argonne National Lab., IL (USA)). Jun 1984. Contract AC04-76DP00789;W-31-109-ENG-38. 273p. (SAND—84-7139-6-84; ANL—84-33). NTIS, PC A12/MF A01 - GPO. File Number TI85000657.

This report summarizes the survey work conducted by Argonne National Laboratory on the design and details of major penetrations in 22 nuclear power plants. The survey includes all containment types and materials in current use. It also includes details of all types of penetrations (except for electrical penetration assemblies and valves) and the seals and gaskets used in them. The report provides a test matrix for testing major penetrations and for testing seals and gaskets in order to evaluate their leakage potential under severe accident conditions.

30814 (NUREG/CR—4263) **Reliability analysis of stiff versus flexible piping. Final project report.** Lu, S.C.; Chou, C.K. (Lawrence Livermore National Lab., CA (USA)). May 1985. Contract W-7405-ENG-48. 76p. (UCRL—20410). NTIS, PC A05/MF A01 - GPO. File Number TI85012990.

This research project is to develop a technical basis for flexible piping designs which will improve piping reliability and minimize the use of pipe supports, snubbers, and pipe whip restraints. This study indicated that piping design can be made more reliable by some reduction of rigid supports and/or snubbers. This study also confirmed that the malfunction of pipe whip restraints introduced higher thermal stresses and tended to reduce the overall piping reliability. Finally, our results indicated that supports in a flexible piping design may need to be reevaluated and that the elimination of pipe supports which are close to components should be done with care in order to minimize the impact on the component reliability.

30815 (WAPD-T—2851) **Automatic capability to store and retrieve component data and to calculate structural integrity of these components.** McKinnis, C.J.; Toor, P.M. (Bettis Atomic Power Lab., West Mifflin, PA (USA)). Jan 1985. Contract AC11-76PN00014. 15p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012429.

In structural analysis, assimilation of material, geometry, and service history input parameters is very cumbersome. Quite often with changing service history and revised material properties and geometry, an analysis has to be repeated. To overcome the above mentioned difficulties, a computer program was developed to provide the capability to establish a computerized library of all material, geometry, and service history parameters for components. The program also has the capability to calculate the structural integrity based on the Arrhenius type equations, including the probability calculations. This unique combination of computerized input information storage and automated analysis procedure assures consistency, efficiency, and accuracy when the hardware integrity has to be reassessed.

30816 (CE-Trans—7726) **Non-linear mathematical model of the dynamics of a turbine for saturated steam.** Miller. A.; Lewandowski, J. (Central Electricity Generating Board, London (UK). Translations Section). 1982. Translation source information not available . (CONF-7905243—1-Trans.). 22p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85901436.

From Conference on steam turbines for nuclear power plants; Plzen, Czechoslovakia (15 May 1979).

The paper presents a nonlinear mathematical model of the dynamics of a turbine for saturated steam installed at a nuclear power station. The model enables an analysis to be made of the transient processes in the turbine flow section caused by various external disturbances. The concept and structure of the model for a typical construction are shown. The relationships describing mass and energy storage processes, as well as the properties of the turbine flow section components are presented. The model is given in the form of a set of differential equations, ordinary, nonlinear and nonlinear algebraic equations. The method of finding a solution to the model is discussed, and results of calculations for turbine overspeed and sudden increase in inlet pressure are given.

2203 Fuel Elements

30817 (AEEW-M—2103) **Particle size distribution of fragmented melt debris from Molten Fuel Coolant Interactions.** Fletcher, D.F. (UKAEA Atomic Energy Establishment, Winfrith). Apr 1984. 23p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701243.

Results are presented of a study of the types of statistical distributions which arise when examining debris from Molten Fuel Coolant Interactions. The lognormal probability distribution and the modifications of this distribution which result from the mixing of two distributions or the removal of some debris are described. Methods of fitting these distributions to real data are detailed. A two stage fragmentation model has been developed in an attempt to distinguish between the debris produced by coarse mixing and fine scale fragmentation. However, attempts to fit this model to real data have proved unsuccessful. It was found that the debris particle size distributions from experiments at Winfrith with thermite generated uranium dioxide/molybdenum melts were Upper Limit Lognormal.

30818 (AEEW-M—2107) **Preliminary results from film boiling destabilisation experiments.** Naylor, P. (UKAEA Atomic Energy Establishment, Winfrith). May 1984. 32p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701244.

A series of experiments to investigate the triggered destabilisation of film boiling has been undertaken. Film boiling was established on a polished brass rod immersed in water and the effects of various triggers were investigated. Preliminary results are presented and two thresholds have been observed: an impulse threshold below which triggered destabilisation will not occur and a thermal threshold above which film boiling will re-establish following triggered destabilisation.

30819 (CONF-850536—4) **Analysis of transient fission gas release and swelling in oxide fuel.** Gruber, E.E. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 22p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012367.

From American Ceramic Society annual meeting; Cincinnati, OH, USA (5 May 1985).

Calculations of fission-gas behavior have been carried out with an updated version of the FRAS3 code for the FGR-40 series of transient tests of irradiated PNL-10 fuel. This same series of tests was used in an earlier evaluation study with a preliminay version of the code. While that study provided positive support for the modeling approach, it also indicated deficiencies in some areas. Although a number of improvements have been implemented in the current version of the code, this study examines the effect of an explicit treatment of bubble growth within the grains, including the effect of vacancy depletion caused by the competition of overpressured bubbles for available vacancies. The result is a reduction by as much as 90% in the predicted swelling, accompanied by an increase in transfer of gas from the grains to boundaries. Both swelling and gas release predictions are brought into much better agreement with the observed values.

30820 (IA—1404, pp 121) **Fractography of irradiated nuclear fuel elements.** Munitz, A.; Livne, Z.; Carlos, C. Jul 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85780940.

Published in summary form only.

In Research laboratories annual report 1983.

30821 (ORNL/CSD—78/R1) DEPTH-CHARGE static and time-dependent perturbation/sensitivity system for nuclear reactor core analysis. Revision I. White, J.R. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 169p. NTIS, PC A08/MF A01. File Number DE85013103.

This report provides the background theory, user input, and sample problems required for the efficient application of the DEPTH-CHARGE system - a code black for both static and time-dependent perturbation theory and data sensitivity analyses. The DEPTH-CHARGE system is of modular construction and has been implemented within the VENTURE-BURNER computational system at Oak Ridge National Laboratory. The DEPTH module (coupled with VENTURE) solves for the three adjoint functions of Depletion Perturbation Theory and calculates the desired time-dependent derivatives of the response with respect to the nuclide concentrations and nuclear data utilized in the reference model. The CHARGE code is a collection of utility routines for general data manipulation and input preparation and considerably extends the usefulness of the system through the automatic generation of adjoint sources, estimated perturbed responses, and relative data sensitivity coefficients. Combined, the DEPTH-CHARGE system provides, for the first time, a complete generalized first-order perturbation/sensitivity theory capability for both static and time-dependent analyses of realistic multidimensional reactor models. This current documentation incorporates minor revisions to the original DEPTH-CHARGE documentation (ORNL/CSD-78) to reflect some new capabilities within the individual codes.

30822 Manufacturing process to reduce large grain growth in zirconium alloys. Rosecrans, P.M. (to Dept. of Energy). US Patent Application 6-636,659. 1 Aug 1984. 11p. Contract AC12-76SN00052.

It is an object of the present invention to provide a procedure for desensitizing zirconium-based alloys to large grain growth (LGG) during thermal treatment above the recrystallization temperature of the alloy. It is a further object of the present invention to provide a method for treating zirconium-based alloys which have been cold-worked in the range of 2 to 8% strain to reduce large grain growth. It is another object of the present invention to provide a method for fabricating a zirconium alloy clad nuclear fuel element wherein the zirconium clad is resistant to large grain growth.

30823 (CONF-850468—1) Application of microprocessor based controller in the Breeder Reactor Program. Messick, N.C. Lukas, M.P. (Argonne National Lab., Idaho Falls, ID (USA); Bailey Controls Co., King of Prussia, PA (USA)). 1985. Contract W-31-109-ENG-38. 12p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85009705.

From Seminar on power plant digital control applications; Phoenix, AZ, USA (9 Apr 1985).

This paper treats Argonne National Laboratory's experience using microprocessor based controllers presently in use on several control loops within the EBR-II reactor facility as well as tests being performed by these controllers. Also included is a discussion of the expandability, modularity, range of capabilities and higher level functions possible using such equipment.

30824 (CRN-CPR—83-11) Study, realization and tests of a simulator reactimeter system at high dynamics. Mahmood, Z. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires). 1983. 207p. (In French). NTIS (US Sales Only), PC A10/MF A01. File Number DE85751326.

An electronic device has been performed for the determination of the reactivity on a nuclear reactor. This reactivity meter is able to make on line measurements. One of the main characteristics of this system which has been achieved with analog circuits, is the large dynamic scale of measurement. This device allowed us to determine the reactivity for different core configurations of the Strasbourg Reactor.

30825 (ITEF—168(1983)) Data acquisition system for a calorimetric installation. Artamonov, A.A.; Gorbunov, P.A.; Kornelyuk, Yu.G.; Savitskij, M.M.; Ehpshtejn, V.Sh. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1983. 44p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701119.

Data acquisition system for a calorimeter with a fine structure is described. The structure and purpose of the main and service programs of the system are considered. The description of the service programs is provided in the form of manual for users. The system operates on-line with the ES-1O10 minicomputer and ensures control and adjustment of physical equipment, data readout, monitoring, preliminary processing, filtration and packing, data recording on a magnetic tape, control of the measurement period and a number of other auxiliary functions.

30826 (JAERI-M—83-187) Development of two-dimensional transient fuel behavior analysis code for non-concentric pellet-cladding alignments, NSR-EXENT. Analysis model and sample calculation. Fujishiro, Toshio; Shirakawa, Noriyuki; Tsuruta, Takaharu. (Japan Atomic Energy Research Inst., Tokyo). Nov 1983. 65p. (In Japanese). NTIS (US Sales Only), PC A04/MF A01. File Number DE85701122.

Two-dimensional transient fuel behavior analysis code "NSR-EXENT" has been developed as a sub-program of NSR-77 in order to analyze local heat transfer effects. This code deals with local effects such as circumferential variation of gap conductance caused by fuel pellet eccentricity and the local cooling by cladding surface thermocouples. The local variation of heat generation by the Zircaloy-water reaction and that of pellet-cladding fixation by the UO_2-Zircaloy eutectic formation have also been incorporated in the model. This report describes the analysis model of NSR-EXENT and the results of sample calculations.

30827 (WH-Trans—508) New surveillance and control techniques and their application to nuclear power plant with particular reference to 1300 MW. Carpentier, L.; Cormault, P. Translated from *Revue Generale Nucleaire* ; No. 3, 218-229(1980). 30p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85900124. DE85900124

Summaries of papers are presented concerning the surveillance and control of nuclear power stations. The simultaneous presentation by many French manufacturers of equipment intended to accomplish the various functions has doubtless underlined their efforts to create new products, but has also made it possible to bring into prominence certain common lines; in following these they have chosen the appropriate technique and technology. The development of large nuclear power stations has, under the impetus of EDF helped to clarify certain aspects relating to equipment schedules. This is why M. Bacher has first mentioned both the proposed French nuclear program and the requirements of quality, timescales and costs which the nuclear power plant must satisfy.

2205 Environmental Aspects

30828 (DOE/PN/00292—T5) Beaver Valley Power Station and Shippingport Atomic Power Station. 1984 Annual environmental report, radiological. Volume 2. (Duquesne Light Co., Pittsburgh, PA (USA)). [1985]. Contract AC11-76PN00292. 127p. NTIS, PC A07/MF A01; 1; GPO Dep. File Number DE85011534.

This report describes the Radiological Environmental Monitoring Program conducted during 1984 in the vicinity of the Beaver Valley Power Station and the Shippingport Atomic Power Station. The Radiological Environmental Program consists of on-site sampling of water and gaseous effluents and off-site monitoring of water, air, river sediments, soils, food pathway samples, and radiation levels in the vicinity of the site. This report discusses the results of this monitoring during 1984. The environmental program outlined in the Beaver Valley Power Station Technical Specifications was followed throughout 1984. The results of this environmental monitoring program show that Shippingport Atomic Power Station and Beaver Valley Power Station operations have not adversely affected the surrounding environment. 23 figs., 18 tabs.

30829 (LPA-P—1) Sizewell 'B' public inquiry. Proof of evidence on local environmental issues. Barritt, E.E. (Suffolk County Council, Ipswich (UK); Suffolk Coastal District Council, Woodbridge (UK)). Nov 1982. 46p. British Library Lending Division, Boston Spa, Wetherby, LS23 7BQ.

The report falls under the headings: introduction (need/economics; safety; waste management; local and site specific issues); the Sizewell site - history and planning policies; planning and environmental implications; land use and landscape implications; ecological implications; mineral requirements; highway implications; employment implications; accommodation implications; infrastructure and social/community services; safeguarding restrictions for Sizewell - Nuclear Installations Inspectorate; decommissioning.

30830 (NUCLEBRAS-CDTN—456) Meteorological instrumentation for nuclear installations. Costa, A.C.L. da. (Centro de Desenvolvimento da Tecnologia Nuclear, Belo Horizonte (Brazil)). 1983. 111p. (In Portuguese). NTIS (US Sales Only), PC A06/MF A01. File Number DE85701465.

The main requirements of regulatory agencies, concerning the meteorological instrumentation needed for the licensing of nuclear facilities are discussed. A description is made of the operational principles of sensors for the various meteorological parameters and associated electronic systems. Finally, it is presented an analysis of the problems associated with grounding of a typical meteorological station.

30831 (NUREG—1033) Final Environmental Statement related to the operation of WPPSS Nuclear Project No. 3 (Docket No. 50-508). (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). May 1985. 253p. NTIS, PC A12/MF A01. File Number TI85901475.

This Final Environmental Statement contains the second assessment of the environmental impact associated with the Washington Public Power System Nuclear Project No. 3 (WNP-3) pursuant to the National Environmental Policy Act of 1969 (NEPA) and Title 10 of the Code of Federal Regulations, Part 51, as amended, of the Nuclear Regulatory Commission regulations. This statement examines the environment, environmental consequences and mitigating actions, and environmental benefits and costs. Land use and terrestrial and aquatic resource impacts will be small. Operational impacts to historic and archeological sites will be negligible. The effects of routine operations, energy transmission and periodic maintenance of rights-of-way and transmission facilities should not jeopardize any populations of endangered or threatened species. No significant impacts are anticipated from normal operational releases of radioactivity. The risk of radiation exposure associated with accidental release of radioactivity is very low. The net socioeconomic effects of the project will be beneficial.

30832 (NUREG—1085) Final Environmental Statement related to the operation of Nine Mile Point Nuclear Station, Unit No. 2 (Docket No. 50-410). (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). May 1985. 373p. NTIS, PC A16/MF A01 - GPO. File Number TI85901424.

This Final Environmental Statement contains the assessment of the environmental impact associated with the operation of the Nine Mile Point Nuclear Station, Unit 2, pursuant to the National Environmental Policy Act of 1969 (NEPA) and Title 10 of the Code of Federal Regulations, Part 51, as amended, of the Nuclear Regulatory Commission regulations. This statement examines the environment, environmental consequences and mitigating actions, and environmental and economic benefits and costs.

30833 (UCID—20413-Vol.2) SMACS - a system of computer programs for probabilistic seismic analysis of structures and subsystems. Volume II. Example problem. Maslenikov, O.R.; Johnson, J.J.; Tiong, L.W.; Mraz, M.J.; Bumpus, S.; Gerhard, M.A. (Lawrence Livermore National Lab., CA (USA)). Mar 1985. Contract W-7405-ENG-48. 375p. NTIS, PC A16/MF A01; 1; GPO Dep. File Number DE85011842.

In this volume of the SMACS User's Manual an example problem is presented to demonstrate the type of problem that SMACS is capable of solving and to familiarize the user with format of the various data files involved. This volume is organized into thirteen appendices which follow a short description of the problem. Each appendix contains listings of the input and output files associated with each computer run that was necessary to solve the problem. In cases where one SMACS program uses data generated by another SMACS program, the data file is shown in the appendix for the programs which generated it.

2206 Research, Test, And Experimental Reactors

30834 (AECL—8252) Slowpoke: the first decade and beyond. Hilborn, J.W.; Burbidge, G.A. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Oct 1983. 19p. (CONF-831012—14). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701504.

From International symposium on use and development of low and medium flux research reactors; Cambridge, MA, USA (17 Oct 1983).

Since the startup of the first SLOWPOKE reactor at Chalk River Nuclear Laboratories in 1970, six SLOWPOKE-2 research reactors have been installed at other locations in Canada and a seventh is nearing completion in Jamaica. Designed mainly for neutron activation analysis, the 20 KW SLOWPOKE produces a thermal neutron flux of 10^{12} n.cm^{-2}s^{-1} at five sample sites in a beryllium reflector surrounding the core. There are an additional five sites in the water reflector outside the beryllium. It has a high degree of inherent safety, arising from the negative temperature and void coefficients of the core, limited maximum excess reactivity, and restricted access to the core by users. As a result the reactor does not require an automatic shutdown system, neutron ionization chambers or low power startup instruments. Automatic control is exercised by a single motor-driven absorber rod responding to a self-powered neutron detector. Once operating, the reactor is licensed to be left unattended, but remotely monitored, for periods up to 24 hours. Because the reactor is so simple and safe, users of the facility can be licensed as operators without formal training in reactor technology. They must, of course, be fully qualified in radiation protection procedures. Reactor users do not have access to the core and are not permitted to store enriched uranium fuel at the reactor site. Present work at the Chalk River Nuclear Laboratories is directed toward the conversion of future SLOWPOKE reactors to low-enriched fuel, in support of an international effort to prevent the possible diversion and misuse of highly-enriched uranium. The feasibility of uprating SLOWPOKE to 2 MWt for heating buildings is also being studied.

30835 (BARC—1231) Measurement of fast neutron flux profile across the inner face of the MAPP-1 end-shield during reactor commissioning. Dravid, H.K.; Mehta, S.L.; Potti, S.T.; Jindal, R.N.; Deniz, V.C. (Bhabha Atomic Research Centre, Bombay (India). Experimental Reactor Physics Section). 1984. 23p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85900981.

Surveillance samples for studying radiation embrittlement of end-shield material, along with the fast neutron fluence monitors, have been introduced for irradiation in various optical sight plugs of RAPS-1, RAPS-2 and MAPP-1 end-shields. These optical sight plugs are located in the peripheral regions of the end-shields and do not correspond to the maximum damage locations, which would be near the axis of the reactor core. The fast neutron flux would fall substantially as one moves from the central to the peripheral points of the end-shield. For carrying out radiation embrittlement correlation at these locations the ratio of the fast flux at or near maximum

BEST COPY AVAILABLE
FOR REPRODUCTION

damage point to the fast flux at the optical sight plugs is required. The above ratio in the region of the air-gap between the end-shield and the calandria was measured during the MAPP-1 commissioning by loading fast neutron flux monitors between fuel pellets in fuel bundles of channels L-10 and T-10, as well as in optical sight plugs, in such a way that all the monitors were in the plane of the inner face of the south end-shield and were irradiated simultaneously during a single reactor run. The channel L-10 is one of the four channels nearest to the axis of the calandria. The average fast flux in the outer ring of L-10 bundle to the average fast flux in the bottom optical sight plug was found to be 30.

30836 (CONF-850410—46) SASSYS-1 computer code verification with EBR-II test data. Warinner, D.K.; Dunn, F.E. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012119.

From ANS/ENS fast reactor safety meeting; Knoxville, TN, USA (21 Apr 1985).

The EBR-II natural circulation experiment, XX08 Test 8A, is simulated with the SASSYS-1 computer code and the results for the latter are compared with published data taken during the transient at selected points in the core. The SASSYS-1 results provide transient temperature and flow responses for all points of interest simultaneously during one run, once such basic parameters as pipe sizes, initial core flows, and elevations are specified. The SASSYS-1 simulation results for the EBR-II experiment XX08 Test 8A, conducted in March 1979, are within the published plant data uncertainties and, thereby, serve as a partial verification/validation of the SASSYS-1 code.

30837 (DOE/NE/32123—T1) Development of improved thermoelectric materials for space nuclear power systems. Sixth technical progress report, March 1985. (General Electric Co., Philadelphia, PA (USA). Space Systems Div.). 1985. Contract AC01-84NE32123. 35p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85013079.

The program consists of two main tasks encompassing (1) the development of an improved SiGe alloy and (2) the development of an as yet unspecified advanced material intended to have superior performance characteristics when compared to SiGe alloys. Significant progress was made toward the goal of producing a SiGe based material with an improved figure-of-merit during this reporting period. In these studies, a quantitative evaluation of the characteristics which produce the low thermal conductivities observed in SiGe alloys is being developed. Specific areas of emphasis include the effects of grain size, charge carrier and GaP concentrations. An alternate method for alloying with GaP was evaluated in which the GaP was added to SiGe during the melting operation.

2207 Plutonium And Isotope Production Reactors

30838 (CONF-850507—14) Neutronic calculations for a new high flux reactor. Difilippo, F.C.; Worley, B.A.; Vondy, D.R. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 8p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011551.

From International conference on nuclear data for basic and applied science; Santa Fe, NM, USA (13 May 1985).

The Oak Ridge National Laboratory has begun the design of a new high flux reactor to be used for basic research, isotope production, and material irradiation. One of the principal goals of the design is the production of a thermal flux peak in the reflector larger than $5 \times 10^{15}/cm^2sec$. A theoretical analysis of the slowing-down and diffusion of neutrons produced by a spherical fission source immersed in a moderator shows that the flux per unit power is maximized by combining a very undermoderated core with a very low absorbing reflector. The theoretical model interrelates total power, power density and transport properties with the thermal flux allowing very inexpensive scoping calculations. Full scale and detailed calculations were made with a numerical model which uses the Bold Venture code system. Calculations show that a highly enriched ^{235}U reactor with D_2O as moderator and reflector would produce the desired peak flux, and the reactor would have a reasonable core life.

30839 (BMI—1984-052) Reliability analysis of crack propagation behavior of reactor components. Schaefer, R.; Schueller, G.I.; Kafka, P. (Bundesministerium des Innern, Bonn (Germany, F.R.); Industrieanlagen-Betriebsgesellschaft m.b.H., Ottobrunn (Germany, F.R.)). Nov 1984. 183p. (In German). NTIS (US Sales Only), PC A09/MF A01. File Number DE85751135.

A reliability analysis was carried out on a circumferential weld in the main coolant loop of a PWR with the aim of estimating the probability of a leak or break occurring in the planned life cycle of the plant. To get a basis for the reliability analysis the following influence factors were more closely examined: initial crack extent, load spectrum including the emergency earthquake situation and crack growth characteristics. For the actual reliability analysis a computer program was developed, which took the individual input data, in accordance with their statistical parameter, into account in a simulation calculation in line with the Monte Carlo Method. The Forman Formula was used to estimate the fatigue crack growth caused by the sequence of load events. The result was, that the fatigue crack growth, even in the case of large initial cracks, was negligibly small. The probability, that, in the case of very deep initial cracks, one-off high quasi-static load, e.g. during an earthquake, could cause a locally limited crack-through, was estimated to be about $5x10^{-6}$ in forty years.

30840 (BMI—1984-056) Comprehensive comparison of out-of-pile and in-pile bundle investigations on fuel rod deformation behavior during loss of coolant accidents. Chakraborty, A.K. (Bundesministerium des Innern, Bonn (Germany, F.R.); Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.)). Nov 1984. 65p. (In German). (GRS-A—945). NTIS (US Sales Only), PC A04/MF A01. File Number DE85751652.

Following the termination of single rod burst tests, both out-of-pile and in-pile bundle examinations with different design conditions and selection of parameters have been initiated and carried out at various places. A direct comparison of the results from the bundle tests becomes only possible with the knowledge of the details of tests. With the help of some common parameters the results of the bundle tests are compared and their influences on the relevance to LOCA are referred. The design parameters as well as those parameters selected as basis for a particular LOCA test, influence the experimental results, and play dominant parts for the evaluation of those results. For example, the existing thermohydraulics play a major part by influencing the ballooning of the cladding. The status up to the beginning of 1983 is considered in this report for comparative evaluation.

30841 (BMI—1984-057) Survey of materials and other problems of relevance in safety engineering, and an assessment of their reflection in regulatory guides for conventional and nuclear engineering (1. technical report). Trunk, M.; Herter, K.H. (Bundesministerium des Innern, Bonn (Germany, F.R.); Stuttgart Univ. (Germany, F.R.). Staatliche Materialpruefungsanstalt). Nov 1984. 93p. (In German). NTIS (US Sales Only), PC A05/MF A01. File Number DE85751130.

Survey and assessment of nuclear engineering specifications and regulatory guides (ASME-BPVC Section III, division 1,2 and KTA, BS 5500) with regard to materials, dimensioning and testing for the purpose of showing to what extent available technical codes, regulatory guides and safety codes are useful in preventing failures and defining the safe limit. The other question examined is that of how these codes ought to be brought up to date in order to reflect the latest state of the art in science and technology.

30844 (BNL-NUREG—35924) Relationship between regulatory issues and probabilistic risk assessments. Ilberg, D.; Papazoglou, I. (Brookhaven National Lab., Upton, NY (USA)). 1985. Contract AC02-76CH00016. 5p. (CONF-850610—22). NTIS, PC A02/MF A01 - GPO. File Number TI85007923.

From Annual meeting of the American Nuclear Society; Boston, MA, USA (9 Jun 1985).

The objective of this study was to obtain some perspective on the characteristics and the relative number of regulatory issues that are PRA related, i.e., can be effectively addressed by plant specific PRA studies. It was also aimed at developing approaches to resolution of regulatory issues as part of plant specific PRAs. Several ongoing NRC programs include a number of safety-related issues which are applicable to operating plants. A number of these issues include aspects that strongly interact with items addressed in PRA studies. The resolution of several generic issues using PRA studies has already started. A review of over 335 issues included in three NRC programs was conducted: Generic Issue Program (GI); Systematic Evaluation Program (SEP); and TMI Action Plan (TMI). The review identifid 240 items related to PRA, 120 of which were judged to have significant effect on core damage frequency. It is believed that these items can be effectively treated in a PRA study that includes internal and external events.

30845 (CONF-811042—11) Measurement of two-phase flow at the core upper plenum interface under simulated reflood conditions. Thomas, D.G.; Combs, S.K. (Oak Ridge National Lab., TN (USA)). 1981. Contract AC05-84OR21400. 17p. NTIS, PC A02 - GPO. File Number DE85004514.

From 9. water reactor safety research information meeting; Washington, DC, USA (26 Oct 1981).

The Instrument Development Loop (IDL) Program is part of the International 2D/3D Refill and Reflood Experimental and Research Program. The principal experimental facilities in the International Program are the Slab Core Experiment in Japan and the Upper Plenum Test Facility (UPTF) in Germany. Among the objectives of the International Program are: the study of the steam binding effect during reflood for various emergency core cooling combinations; the study of the reflood flow distribution (chimney effect) in a heated core; and the study of the flow hydrodynamics in the core, downcomer, and upper plenum during refill and reflood. A major problem is coupling the results to be obtained at the two major experiments. One approach is to measure the flows at the interface boundary of the two experiments and attempt to match them as closely as possible. Therefore the two major objectives of the IDL Program were to simulate expected flows at the core/upper plenum interface during the reflood phase of a postulated LOCA and to develop instrumentation systems for mass flow measurement at the core/upper plenum interface.

30846 (CONF-850406—8) Behavior of aerosols in a steam-air environment. Adams, R.E.; Tobias, M.L.; Longest, A.W. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 18p. NTIS, PC A02/MF A01 - GPO. File Number TI85011422.

From International symposium and workshop on particulate and multi-phase processes and the 16th annual meeting of the Fine Particle Society; Miami Beach, FL, USA (22 Apr 1985).

The behavior of aerosols assumed to be characteristic of those generated during light water reactor (LWR) accident sequences and released into containment is being studied in the Nuclear Safety Pilot Plant (NSPP) which is located at the Oak Ridge National Laboratory (ORNL). The program plan for the NSPP aerosol project provides for the study of the behavior, within containment, of simulated LWR accident aerosols emanating from fuel, reactor core structural materials, and from concrete-molten core materials interactions. The aerodynamic behavior of each of these aerosols was studied individually to establish its characteristics; current experiments involve mixtures of these aerosols to establish their interaction and collective behavior within containment. Tests have been conducted with U_3O_8 aerosols, Fe_2O_3 aerosols, and concrete aerosols in an environment of either dry air [relative humidity (RH) less than 20%] or steam-air [relative humidity (RH) approximately 100%] with aerosol mass concentration being the primary experimental variable.

30847 (CONF-850406—10) Downstream behavior of volatile fission product species. Farahat, M.; Settle, J.; Johnson, I.; Johnson, C.E. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 11p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012124.

From International symposium and workshop on particulate and multi-phase processes and the 16th annual meeting of the Fine Particle Society; Miami Beach, FL, USA (22 Apr 1985).

An experimental facility was constructed to study the behavior of volatile fission product (VFP) species in a flowing steam environment. Experiments were conducted using CsI as the VFP. An aqueous solution of CsI was injected into 1000°C superheated steam flowing into a horizontal pipe, 3.7 m long, under a controlled temperature gradient. The distribution of CsI deposits along the pipe wall was determined. Scanning electron microscopy was used for inspecting the deposits. Vapor condensation patterns and aerosol particles were identified. Comparison of the experimental results with predictions of the Reactor Aerosol Formation and Transport (RAFT) computer code was made.

30848 (CONF-850410—41) Acceptability of local boiling during shutdown heat removal. Dunn, F.E. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012115.

From ANS/ENS fast reactor safety meeting; Knoxville, TN, USA (21 Apr 1985).

Failures in the shutdown heat removal system of an LMFBR might lead to flow stagnation and coolant boiling in the reactor core. At normal operating power, the onset of sodium boiling will lead to film dryout and melting of the cladding and fuel within a few seconds. On the other hand, both calculations and currently available experimental data indicate that at neat fluxes corresponding to decay heat power levels, boiling leads to improved heat removal; and it limits the temperature rise in the fuel pins. Therefore, when setting criteria for decay heat removal systems, there is no reason to preclude sodium boiling per se because of heat removal considerations.

30849 (CONF-850410—43) Accommodation of unprotected accidents by inherent safety design features in metallic and oxide-fueled LMFBRs. Cahalan, J.E.; Sevy, R.H.; Su, S.F. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 8p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012114.

From ANS/ENS fast reactor safety meeting; Knoxville, TN, USA (21 Apr 1985).

This paper presents the results of a study of the effectivness of intrinsic design features to mitigate the consequences of unprotected accidents in metallic and oxide-fueled LMFBRs. The accidents analyzed belong to the class generally considered to lead to core disruption; unprotected loss-of-flow (LOF) and transient overpower (TOP). Results of the study demonstrate the potential for design features to meliorate accident consequences, and in some cases to render them benign. Emphasis is placed on the relative performance of metallic and oxide-fueled core designs.

30850 **(CONF-850410—47) Scoping studies of vapor behavior during a severe accident in a metal-fueled reactor.** Spencer, B.W.; Marchaterre, J.F. (Argonne National Lab., IL (USA)). 15 Apr 1985. Contract W-31-109-ENG-38. 17p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011474.

From ANS/ENS fast reactor safety meeting; Knoxville, TN, USA (21 Apr 1985).

Scoping calculations have been performed examining the consequences of fuel melting and pin failures for a reactivity-insertion type accident in a sodium-cooled, pool-type reactor fueled with a metal alloy fuel. The principal gas and vapor species released are shown to be Xe, Cs,and bond sodium contained within the fuel porosity. Fuel vapor pressure is insignificant, and there is no energetic fuel-coolant interaction for the conditions considered. Condensation of sodium vapor as it expands into the upper sodium pool in a jet mixing regime may occur as rapidly as the vapor emerges from the disrupted core (although reactor-material experiments are needed to confirm these high condensation rates). If the predictions of rapid direct-contact condensation can be verified experimentally for the sodium system, the implication is that the ability of vapor expansion to perform appreciable work on the system is largely eliminated. Furthermore, the ability of an expanding vapor bubble to transport fuel and fission product species to the cover gas region where they may be released to the containment is also largely eliminated. The radionuclide species except for fission gas are largely retained within the core and sodium pool.

30851 **(CONF-850410—48) Role of fuel bubble phenomenology in assessment of LMFBR source term.** Cho, D.H.; Condiff, D.W.; Chan, S.H. (Argonne National Lab., IL (USA); Wisconsin Univ., Milwaukee (USA). Dept. of Mechanical Engineering). 1985. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012110.

From ANS/ENS fast reactor safety meeting; Knoxville, TN, USA (21 Apr 1985).

Phenomenological aspects of a fuel vapor bubble formed in the sodium pool in a hypothetical severe accident are considered. The potential for fuel bubble collapse in the sodium pool is analyzed. It appears that for a wide range of hypothetical LMFBR accidents involving core vaporization, the fuel vapor bubble would likely be quenched and collapse prior to migration to the cover gas region. Such rapid quenching is due mainly to radiative heat transfer from the fuel bubble, coupled with the inherent capability of the sodium pool (large subcooling and high thermal conductivity) to dissipate thermal energy. Major uncertainty in the analysis concerns fuel vapor condensation phenomena at the sodium interface and its effect on the sodium surface radiation absorptivity. This is discussed in detail.

30852 **(CONF-850410—49) Quantitative analysis of the effect of complex internals on LMFBR containment during energetic accidents.** Zeuch, W.R.; Wang, C.Y. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 11p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012111.

From ANS/ENS fast reactor safety meeting; Knoxville, TN, USA (21 Apr 1985).

This paper discusses the effects of complex internals on the containment response of large LMFBRs during energetic accidents. Results of a series of analyses with the ALICE-II code demonstrate quantitative structural and hydrodynamic effects from parametric variation of reactor internal designs. Effects of various upper internal structure treatments, structural stiffness of the upper internal structure and core support structure, and the location and dimensions of internal components are examined. Results indicate that reduction of primary containment loads can be accomplished through such means as confinement of the core region and avoiding overstrengthened, rigid internals. A study of the beneficial and adverse parameters involved in primary containment response should be helpful in optimizing designs for safety purposes.

30853 **(CONF-850417—23) Development of the flowsheet used for decontaminating high-activity-level water at TMI-2. Draft.** Collins, E.D.; Campbell, D.O.; King, L.J.; Knauer, J.B.; Wallace, R.M. (Oak Ridge National Lab., TN (USA); Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1985. Contract AC05-84OR21400. 31p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012782.

From 189. national meeting of the American Chemical Society; Miami, FL, USA (28 Apr 1985).

Using a few small samples of high-activity-level water from TMI-2, a chemical processing flowsheet was developed for decontamination of the water and concentration of the radioactive contaminants in a form suitable for disposal. The initially selected process was evaluated and significantly improved. The improved process included sorption of the bulk radioactive materials, cesium and strontium, onto a mixture of inorganic zeolites and sorption of the anionic contaminants, antimony and ruthenium, plus the remaining traces of cesium and strontium onto standard organic ion exchange resins. The latter step was accomplished by means of a special deionization/sorption technique.

30854 **(CONF-850570—5) ORNL's NRC-sponsored HTGR safety and licensing analysis activities for Fort St. Vrain and advanced reactors.** Ball, S.J.; Cleveland, J.C.; Harrington, R.M. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 11p. NTIS, PC A02/MF A01 - GPO. File Number TI85012098.

From IAEA specialists' meeting on gas cooled reactors; Oak Ridge, TN, USA (13 May 1985).

The ORNL safety analysis program for the HTGR was established in 1974 to provide technical assistance to the USNRC on licensing questions for both Fort St. Vrain and advanced plant concepts. The emphasis has been on development of major component and system dynamic simulation codes, and use of these codes to analyze specific licensing-related scenarios. The program has also emphasized code verification, using Fort St. Vrain data where applicable, and comparing results with industry-generated codes. By the use of model and parameter adjustment routines, safety-significant uncertainties have been identified. A major part of the analysis work has been done for the Fort St. Vrain HTGR, and has included analyses of FSAR accident scenario re-evaluations, the core block oscillation problem, core support thermal stress questions, technical specification upgrade review, and TMI action plan applicability studies. The large, 2240-MW(t) cogeneration lead plant design was analyzed in a multi-laboratory cooperative effort to estimate fission product source terms from postulated severe accidents.

30855 **(CONF-850570—6) Simulation of thermal response of the 250 MWT modular HTGR during hypothetical uncontrolled heatup accidents.** Harrington, R.M.; Ball, S.J. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 12p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012102.

From IAEA specialists' meeting on gas cooled reactors; Oak Ridge, TN, USA (13 May 1985).

One of the central design features of the 250 MWT modular HTGR is the ability to withstand uncontrolled heatup accidents without severe consequences. This paper describes calculational studies, conducted to test this design feature. A multi-node thermal-hydraulic model of the 250 MWT modular HTGR reactor core was developed and implemented in the IBM CSMP (Continuous System Modeling Program) simulation language. Survey calculations show that the loss of forced circulation accident with loss of steam generator cooling water and with accidental depressurization is the most severe heatup accident. The peak hot-spot fuel temperature is in the neighborhood of 1600°C. Fuel failure and fission product releases for such accidents would be minor. Sensitivity studies show that code input assumptions for thermal properties such as the side reflector conductivity have a significant effect on the peak temperature. A computer model of the reactor vessel cavity concrete wall and its surrounding earth was developed to simulate the extremely unlikely and very slowly-developing heatup accident that would take place if the worst-case loss of forced primary coolant circulation accident were further compounded by the loss of cooling water to the reactor vessel cavity liner cooling system. Results show that the ability of the earth surrounding the cavity to act as a satisfactory long-term heat sink is very sensitive to the assumed rate of decay heat generation and on the effective thermal conductivity of the earth.

30856 **(CONF-850610—6) Degraded core study using the multidimensional COMMIX code.** Chen, B.C.; Domanus, H.M.; Sha, W.T.; Sehgal, B.R. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85006196.

From Annual meeting of the American Nuclear Society; Boston, MA, USA (9 Jun 1985).

Considerable interest has been generated recently in the area of reactor coolant system (RCS) flow behavior during conditions of inadequate core cooling (ICC) and severe accidents. The natural convection phenomena in the multidimensional domain have a significant effect on the accident scenario and consequences. The heat transfer and fission product migration could be very different in a one-dimensional geometry when compared with that of a two- or three-dimensional geometry. Existing analytic tools in analyzing the three-dimensional natural convection phenomena are very scarce. The most well-known codes such as RELAP-5 and TRAC are inadequate in treating the recirculating flows such as countercurrent flows in the hot legs. Because of this consideration, the multidimensional COMMIX code was used for this degraded core study.

30857 **(CONF-850629—1-Summ.) Distribution of fission products in an LMFBR: summary.** Villarreal, R.; Young, J.O. (Argonne National Lab., Idaho Falls, ID (USA)). 1985. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85002770.

From International conference on analytical chemistry in nuclear technology; Karlsruhe, F.R. Germany (4 Jun 1985).

The overall distribution of fission products released from experimental subassemblies containing breached fuel elements has been determined in the fuel and throughout the EBR-II primary and secondary reactor systems. Identification of the fission products released to the primary sodium and location of areas of concentration was important in anticipating radioactive species and levels of deposited fission and activation products on components removed from the primary tank for maintenance and repair. The results of extensive radioanalytical measurements on the fuel, fuel cladding, primary sodium and cover gas system, secondary sodium and cover gas system and steam system are summarized.

30858 **(CONF-8504126—1) Ultra-reliable computer systems: an integrated approach for application in reactor safety systems.** Chisholm, G.H. (Argonne National Lab., Idaho Falls, ID (USA)). 1985. Contract W-31-109-ENG-38. 20p. (CONF-850610—28). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85010487.

From EPRI fault-tolerant systems seminar; Phoenix, AZ, USA (1 Apr 1985).

Improvements in operation and maintenance of nuclear reactors can be realized with the application of computers in the reactor control systems. In the context of this paper a reactor control system encompasses the control aspects of the Reactor Safety System (RSS). Equipment qualification for application in reactor safety systems requires a rigorous demonstration of reliability. For the purpose of this paper, the reliability demonstration will be divided into two categories. These categories are demonstrations of compliance with respect to (a) environmental; and (b) functional design constrains. This paper presents an approach for the determination of computer-based RSS respective to functional design constraints only. It is herein postulated that the design for compliance with environmental design constraints is a reasonably definitive problem and within the realm of available technology. The demonstration of compliance with design constraints respective to functionality, as described herein, is an extension of available technology and requires development.

30859 **(DEMO—83/17) Temperature estimations in air cooled fuel elements on an open pool research reactor core after loss of coolant.** Bartzis, J.G. (Democritos Nuclear Research Center, Athens (Greece)). Nov 1983. 48p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701505.

In open pool research and test reactors it is essential to demonstrate, in the case of loss of the tank water under accident conditions, that the ambient air is capable of keeping the temperature level below the melting point. This work is part of an effort to build capability of predicting fuel temperature in the air-cooled core of the Greek Research Reactor-1 (GRR-1) or similar ones. To this purpose a 3-D computer program named ThEAP-I is under development. Temperature calculations are performed taking into consideration important factors such as external and internal natural convection, heat radiation, grid plate effect, interrupted daily and weekly reactor working schedule, number of fuel cycles for a particular fuel element, etc. In the present work the overall problem of modelling, as well as certain applications are presented and discussed.

30860 **(DOE/HTGR—85-026) Quantitative HTGR safety and forced outage goals.** Houghton, W.J.; Parme, L.L.; Silady, F.A. (GA Technologies, Inc., San Diego, CA (USA)). May 1985. Contract AT03-84SF11963. 12p. (CONF-850570—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE85011737.

From IAEA specialists' meeting on gas cooled reactors; Oak Ridge, TN, USA (13 May 1985).

A key step in the successful implementation of the integrated approach is the definition of the overall plant-level goals. To be effective, the goals should provide clear statements of what is to be achieved by the plant. This can be contrasted to the current practice of providing design-prescriptive criteria which implicitly address some higher-level objective but restrict the designer's flexibility. Furthermore, the goals should be quantifiable in such a way that satisfaction of the goal can be measured. In the discussion presented, two such plant-level goals adopted for the HTGR and addressing the impact of unscheduled occurrences are described. 1 fig.

30861 **(EGG-M—07585) Reactor containment purge and vent valve performance experiments.** Hunter, J.A.; Steele, R.; Watkins, J.C. (EG and G Idaho, Inc., Idaho Falls (USA)). 1985. Contract AC07-76ID01570. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85012611.

Three nuclear-designed butterfly valves typical of those used in domestic nuclear power plant containment purge and vent applications were tested. For a comparison of responses, two eight-inch nominal pipe size valves with differing internal design were tested. For extrapolation insights, a 24-inch nominal pipe size valve was also tested. The valve experiments were performed with various piping configurations and valve disc orientations to the flow, to simulate various installation options in field application. As a standard for comparing the effects of the installation options, testing was also performed in a standard ANSI test section. Test cycles were performed at inlet pressures of 5 to 60 psig, while monitoring numerous test parameters, such as the valve disc position, valve shaft torque, mass flow rate, and the pressure and temperature at multiple locations throughout the test section. An experimental data base was developed to assist in the evaluation of the current analytical methods and to determine the influence of inlet pressure, inlet duct geometry, and valve orientation to the flow media on valve torque requirements, along with any resulting limitations to the extrapolation methods. 2 refs., 15 figs.

30862 **(EGG-M—11485) Description of the Semiscale Mod-2C Facility, including scaling principle and current measurement capabilities.** Shaw, R.A.; Boucher, T.J.; Loomis, G.G. (Idaho National Engineering Lab., Idaho Falls (USA)). 1985. Contract AC07-76ID01570. 14p. (CONF-850646—3). NTIS, PC A02. File Number DE85012615.

From 2. international specialists meeting on small break LOCA analyses in LWRs; Pisa, Italy (24 Jun 1985).

This paper provides a general description of the Semiscale Mod-2C Facility. The scaling principle (modified volume) is discussed including the relative merits and disadvantages with respect to PWR characterization. A summary of the current thermal-hydraulic measurement capabilities is also included.

30863 **(EGG-TMI—6859) Computer code calculations of the TMI-2 accident: initial and boundary conditions.** Behling, S.R. (EG and G Idaho, Inc., Idaho Falls (USA)). May 1985. Contract AC07-76ID01570. 49p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012613.

Initial and boundary conditions during the Three Mile Island Unit 2 (TMI-2) accident are described and detailed. A brief description of the TMI-2 plant configuration is given. Important contributions to the progression of the accident in the reactor coolant system are discussed. Sufficient information is provided to allow calculation of the TMI-2 accident with computer codes.

30864 **(EPRI-NP—3838) Review of selected topics from PRA studies: system dependencies, human interactions, and containment event trees.** Orvis, D.D.; Deremer, R.K.; Frank, M.V.; Joksimovich, V. (NUS Corp., San Diego, CA (USA)). May 1985. 265p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920659.

A Phase II review has been conducted by the NUS Corporation of probabilistic risk assessment (PRA) studies for five plants: Big Rock Point, Zion, Limerick, Grand Gulf and Arkansas Nuclear One - Unit 1. The results of the Phase I review reported in "A Review of Some Early Large-Scale Probabilistic Risk Assessments" addressed a wide range of topics and issues that make up a PRA study. Phase II provides a greater depth of review in three key areas of PRA analyses that appeared to affect the results of the studies most: system dependencies, human interactions, and containment event trees. The review includes selected sensitivity analyses of key parameters and assumption with the objective of determining whether differences between results of PRAs reviewed, with respect to dominant accident sequences for significant core damage and/or significant releases, are attributable to physical differences between plants (design, site or operation) or to analytical differences between studies (methodology and assumptions).

30865 (EPRI-NP—3912-SR-Vol.1, pp 2.1-2.11) **Multiple components malfunction scenarios--a classification technique with emphasis on shared-cause events.** Crellin, G.L.; Jacobs, I.M.; Kujawski, E.; Smith, A.M.; Worledge, D. (Los Alamos Technical Associates, Inc., San Jose, CA). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The authors of this study, under EPRI sponsorship, undertook the task of formulating a working definition for common-cause failure; however, they discovered such a wide diversity of event scenarios that no simple definition proved to be helpful. The alternative was to devise a classification system for all event scenarios, but designed with the ability to handle shared-cause phenomena. The objectives of pursuing this line of investigation are three-fold: 1) develop a logical and credible method for dissecting and understanding actual component malfunction scenarios in order to identify multiple events where the shared-cause phenomenon is important; 2) support various analyses, including probabilistic risk assessments, with a means of segregating data for use in statistical and modeling evaluations; and 3) assess the effectiveness of defensive strategies that may be employed where a need to reduce the impact of shared-cause malfunctions exists. Having established the clear distinction between root causes and component causes and between failures and functional unavailabilities, an event scenario can be readily broken down into its elementary parts wherein each component has an identifiable cause of its unavailability and each scenario has an overall classification. The heart of this system is a device called a Cause-Effect Logic Diagram which depicts the interrelationship between causes and components.

30866 (EPRI-NP—3912-SR-Vol.1, pp 3.1-3.14) **Common cause data analysis and implications in system modeling.** Fleming, K.N.; Mosleh, A. (Pickard, Lowe and Garrick, Inc., Newport Beach, CA). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The purpose of this paper is to discuss some recent advances that have been made in the treatment of dependent events in the utility-sponsored probabilistic risk assessments (PRA) on Seabrook and Midland nuclear power plants and in research projects sponsored by the Electric Power Research Institute (EPRI). The particular topics of interest in this paper are the applications of a classification system to the development of a dependent events data base and the analysis of these data to support system level modeling and quantification of dependent events of the type performed in applied risk and reliability evaluation. The EPRI classification system has made it possible to develop a dependent events data base to support qualitative and quantitative systems analyses. The portion of the data base completed thus far for selected components has identified 422 dependent events, of which 113 have been classified as generic common cause events. Many of the existing published PRA studies, especially those that did not include parametric modeling of common cause events, did not account for most of these 113 events. This is due to overreliance on explicit modeling, which has proved reliable only for those dependent events resulting from the functional dependence among several components. It is important that future applied risk and reliability studies be held accountable for all experienced and documented dependent events.

30867 (EPRI-NP—3912-SR-Vol.1, pp 4.1-4.11) **Common cause failure methods dealing with dependent failures; a comparative application to US diesel generator data based on licensee event reports.** Virolainen, R.; Buslik, A. Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The best treatment of dependent failures is an undecided issue in reliability analysis at present. In practice, only Flemings β-factor method and recently Atwood's Binomial failure rate common cause model have obtained more general approval in the probabilistic risk analyst community. The authors compare the above mentioned parametric common cause failure models to each other, as well as to some non-parametric models using actual diesel generator data originating in Licensee Event Reports (LER). In this context they use the lognormal distribution to fit the failure rates from LER data and compare this with the distribution determined by the binomial failure rate model. They also compare the β-factors obtained directly from data to those from Atwood's method. Based on this data base, they calculate the plant-by-plant unavailability distributions for the 1 out of 2 diesel generator system using the β-factor method, Atwood's method, Hartung's correlation model (non-parametric), and the estimated lognormal distributions assuming 1) independence and 2) complete dependence (statistical correlation) between parallel diesel generators. Due to the excellent data base, they have also been able to estimate the unavailability distribution directly from data using the individual failure rates of parallel diesel generators. These unavailability distributions are then compared to those obtained by different methods; the parameters compared are the mean, median and measures of uncertainty.

30868 (EPRI-NP—3912-SR-Vol.1, pp 5.1-5.9) **Survey and evaluation of system interaction events and sources.** Murphy, G.A.; Johnson, M.P.; Rooney, J.J.; Casada, M.L.; Muhlheum, M.D.; Turner, J.H. (Oak Ridge National Lab., TN). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

In 1974, the Advisory Committee on Reactor Safeguards (ACRS) recommended to the Nuclear Regulatory Commission (NRC) that undesirable system interactions involving safety systems should be analyzed in the licensing of standardized designs for nuclear power plants. This ACRS interest, along with concern expressed by members of the NRC staff, led to the initiation, in 1978, of the Unresolved Safety Issue A-17, System Interaction. This paper describes a project that is part of the current activities scheduled to resolve this safety issue during calendar year 1985. This project was sponsored by the NRC Generic Issues Branch and conducted by the Nuclear Operations Analysis Center at the Oak Ridge National Laboratory. The project objectives were to identify system interaction events that have been reported by licensed nuclear power plants and to collect information about those events. These events include both events that have occurred and events that have been postulated. This operating experience review was seen as a first step in assessing the significance of potential system interaction events and in determining how to resolve the safety issue.

30869 (EPRI-NP—3912-SR-Vol.1, pp 6.1-6.10) **Analysis of dependent failures in the ORNL precursor study.** Ballard, G.M. Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The study of dependent failures (or common cause/mode failures) in the safety assessment of potentially hazardous plant is one of the significant areas of uncertainty in performing probabilistic safety studies. One major reason for this uncertainty is that data on dependent failures is apparently not readily available in sufficient quantity to assist in the development and validation of models. The incident reports that were compiled for the ORNL study on Precursors to Severe Core Damage Accidents (NUREG/CR-2497) provide an opportunity to look at the importance of dependent failures in the most significant incidents of recent reactor operations, to look at the success of probabilistic risk assessment (PRA) methods in accounting for the contribution of dependent failures, and to look at the dependent failure incidents with the aim of identifying the most significant problem areas. In this paper an analysis has been made of the incidents compiled in NUREG/CR-2497 and events involving multiple failures which were not independent have been identified. From this analysis it is clear that dependent failures are a very significant contributor to the precursor incidents. The method of enumeration of accident frequency used in NUREG-2497 can be shown to take account of dependent failures and this may be a significant factor contributing to the apparent difference between the precursor accident frequency and typical PRA frequencies.

30870 (EPRI-NP—3912-SR-Vol.1, pp 7.1-7.13) **Implementation of safety goals in NRC's regulatory process.** Murley, T.E. (Nuclear Regulatory Commission, Washington, DC). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

In May 1983 the Nuclear Regulatory Commission issued a policy statement on Safety Goals For Nuclear Power Plant Operation. The Commission at the same time judged that a two-year evaluation period was necessary to judge the effectiveness of the goals and design objectives, and directed the staff to develop information and understanding as to how to further define and use the design objectives and the cost-benefit guidelines. In carrying out the Commission's mandate, the staff framed three major questions to be addressed during the safety goal evaluation period. These three questions are: 1) to what extent is it practical to use safety goals in the regulatory process? 2) Should the quantitative design objectives be modified or supplemented? If so, how? 3) How should the safety goals be implemented at the end of the evaluation period? The staff's conclusions are discussed.

The Commission of the European Communities started about 12 years ago, together with Member States experts from licensing authorities, utilities and manufacturers an effort of harmonization of methodologies, criteria standards and codes for light water reactor safety (Working Group N 1 on LWR Safety). After consultation with this Working Group, the Commission of the EC in 1982 set up a special group with the task to report on the status of the need, possibilities and limitations for/of overall safety objectives for Nuclear Power Plants. As a result in May 1983 a "Status Report on Safety Goals/Objectives" has been published. At about the same time statements/comments have been formulated by the Task Force and submitted to USNRC on the "USNRC Policy Statement on Safety Goals for the Operation of Nuclear Power Plants" and the related "Evaluated Plan". The Task Force decided in June 1984 to undertake further activities, which have started already. The first results of these activities are mentioned in the paper.

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

Nuclear Safety Analysis Center (NSAC) has conducted an initial study of the concept and applicability of alternative numerical safety goals, including the goals now under evaluation by the Nuclear Regulatory Commission (NRC) and other performance criteria formats. The basic approach was to address two fundamental questions: 1) Under what conditions, in what forms, and for what purposes are numerical goals or criteria most likely to be useful? 2) given that numerical goals appear to be useful, what is an appropriate method for setting them? The objective of this study was not to provide definitive answers to these questions, to recommend any specific numerical goals or criteria, or to propose any particular uses of such goals. Rather, it was to shed enough light on the concept and applicability of numerical goals, through developing some insights regarding the above questions and the issues they raise, to determine whether a more detailed, in-depth addressing of the questions is appropriate. This paper briefly summarizes why the EPRI/NSAC study was initiated, how it was carried out, and what its results were.

The assessment of risk and the appropriate form of quantitative safety goal has many different aspects. In the paper, some aspects are pointed out. In particular, results of a study performed by GRS are presented. An example of a tentitative safety goal is shown with the intention to give guidance for further development and improvement of safety features also with regard to severe accidents.

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

Probabilistic risk assessments (PRA) of nuclear reactors now represent a substantial data base which describes relative plant accident potentials, plant failure modes, and plant system failure probabilities. The PRA analyses can be used to make design related decisions. In the past, however, nuclear plant design relied primarily on traditional engineering approaches along with quality control and regulatory review. In this study, the authors try to see whether system and subsystem performance standards can be extracted from a set of existing PRAs using contribution to core melt as the primary attribute of interest. The approach taken uses system and plant failure data from six pressurized water reactor PRAs. Importance measures are developed and applied to gage the impact of various systems on plant core melt. These measures are also applied to modified plant configurations which meet a dominant sequence core melt contribution limit of 1.0×10^{-5} core melts per plant per reactor year. In addition, plant failure modes are put into functional groups, and sequences are placed into accident classes. Together, these approaches define the failure characteristics of the six plants and seek to discern failure patterns and the defacto existence of performance standards. A method of limiting the sensitivity of the plant (measured as an increase in core melt frequency) to hypothetical increases in event unavailabilities is proposed. Bounding estimates of the effect of the standard pairs on plant core melt frequency are derived.

(Brookhaven National Lab., Upton, NY). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

This paper describes a methodology for allocating reliability and risk to various reactor systems, subsystems, components, operations, and structures in a consistent manner, based on a set of global safety criteria which are not rigid. The problem is formulated as a multiattribute decision analysis paradigm; the multiobjective optimization, which is performed on a PRA model and reliability cost functions, serves as the guiding principle for reliability and risk allocation. The concept of noninferiority is used in the multiobjective optimization problem. Finding the noninferior solution set is the main theme of the current approach. The assessment of the decision maker's preferences could then be performed more easily on the noninferior solution set. Some results of the methodology applications to a nontrivial risk model are provided and several outstanding issues such as generic allocation and preference assessment are discussed.

(Sandia National Labs., Albuquerque, NM). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1). Contract AC04-76DP00789.

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

Probabilistic Risk Assessment (PRA) is playing an increasingly important role in the nuclear reactor regulatory process. The assessment of uncertainties associated with PRA results is widely recognized as an important part of the analysis process. One of the major criticisms of the Reactor Safety Study was that its representation of uncertainty was inadequate. The desire for the capability to treat uncertainties with the MELCOR risk code being developed at Sandia National Laboratories is indicative of the current interest in this topic. However, as yet, uncertainty analysis and sensitivity analysis in the context of PRA is a relatively immature field. In this paper, available methods for uncertainty analysis and sensitivity analysis in a PRA are reviewed. This review first treats methods for use with individual components of a PRA and then considers how these methods could be combined in the performance of a complete PRA. In the context of this paper, the goal of uncertainty analysis is to measure the imprecision in PRA outcomes of interest, and the goal of sensitivity analysis is to identify the major contributors to this imprecision. There are a number of areas that must be considered in uncertainty analysis and sensitivity analysis for a PRA: (1) information, (2) systems analysis, (3) thermal-hydraulic phenomena/fission product behavior, (4) health and economic consequences, and (5) display of results. Each of these areas and the synthesis of them into a complete PRA are discussed.

30877 (EPRI-NP—3912-SR-Vol.1, pp 16.1-16.2) **Parameter and model uncertainty in seismic hazard analysis.** Cornell, C.A.; O'Hara, T. (Stanford Univ., CA). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The input required by modern Probabilistic Safety Assessment (PSA), along with frequent requests by decision makers and regulators for quantitative statements of uncertainty in low probability hazard estimates, has required development of methodology to analyze and display the results of multiple seismic hypotheses. Because the number of hazard curves generated may be in the thousands, a computer program was developed to automatically handle alternative models, mean activity rates, b-values, and upper bound magnitudes. Also, a grouping routine has been incorporated into the program to present the results either as a small number of representative curves for input to a PSA or in a more traditional form, e.g., 16-50-84 percentiles. The advantage of a multiple hypothesis method is that experts not users can be used to define consistent hypotheses, and based upon their experience and the degree of support in the data, determine a weight (probability) defining a degree of belief associated with each individual hypothesis. This result is a quantification of their uncertainty. But once the analysis has been completed, and all possible alternatives have been addressed, subsequent assessments of seismic hazard will simply be rearrangements of the weights applied to the alternatives. In this manner, the seismic hazard, based upon more reliable and future information, can easily be updated.

(Science Applications International Corp., Los Altos, CA). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The main difficulty in estimating the frequency and consequences associated with severe accidents is that there is no directly applicable data base with which to estimate these quantities. To circumvent this lack of direct data, numerous experiments and code analyses which attempt to simulate the expected behavior of accident phenomena are conducted. This body of information, albeit it has non-prototypical characteristics, can be used to help form qualitative conclusions about specific aspects of the physical behavior of these accidents. Integration of this information in a systematic and traceable manner can also provide a comprehensive description of the state of understanding of the physical behavior of the accidents. Estimates of accident frequency and consequence distributions can then be established based on these comprehensive descriptions to aid in understanding both the magnitudes and root causes of uncertainties in the risk. This paper describes just such an approach which was used to estimate frequencies and consequences and their uncertainties for LMFBR core disruptive accident energetics.

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

Two main aspects have to be taken into account in studying a nuclear accident scenario when using nuclear safety codes as an information source. The first one concerns the behavior of the code response and the set of assumptions to be introduced for its modelling. The second one is connected with the uncertainty features of the code input, often modelled as a probability density function (pdf). The analyst can apply two well-defined approaches depending on whether he wants major emphasis put on either of the aspects. Response Surface Methodology uses polynomial and inverse polynomial models together with the theory of experimental design, expressly developed for the identification procedure. It constitutes a well-established body of techniques able to cover a wide spectrum of requirements, when the first aspect plays the crucial role in the definition of the objectives. Other techniques such as Latin hypercube sampling, stratified sampling or even random sampling can fit better, when the second aspect affects the reliability of the analysis. The ultimate goal for both approaches is the selection of the variable, i.e. the identification of the code input variables most effective on the output and the uncertainty propagation, i.e. the assessment of the pdf to be attributed to the code response. The main aim of this work is to present a sensitivity analysis method, already tested on a real case, sufficiently flexible to be applied in both approaches mentioned.

30880 (EPRI-NP—3912-SR-Vol.1, pp 22.1-22.9) **Uncertainty bands in CCDF risk curves; their importance in decision making processes.** Stern, E.; Tadmor, J. (Israel Atomic Energy Commission, Tel-Aviv). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

In the present study, examples of uncertainty bands of early fatalities CCDF risk curves are shown for nuclear power plants located in two densely populated sites, A and B, which differ from each other mainly by the population distribution patterns and the meteorological conditions. The REMAND computer code was used for assessing the consequences of various severe accidents in a nuclear power plant. The accidents analyzed were the WASH-1400 types PWR-1, PWR-2 up to PWR-5 and the annual probabilities of occurrence therein were also adopted, for each accident. The uncertainty bands were obtained by using two sets of parameters in the consequence modelling part of the PRA, namely a conservative and best estimate set. Based on sensitivity studies it is believed that the conservative and the best estimate curves represent the 90%-95% and the 50% curves, respectively. In other words, it is believed that there is only a few percent chance of getting a complementary cumulative distribution function curve higher than the conservative one, and that the best estimate curve lies within a range of no more than +/-10% from the real 50% curve.

(Brookhaven National Lab., Upton, NY). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

During the last several years BNL staff have performed in-depth reviews of the containment failure modes and fission product release analyses of all of the industry PRAs submitted to the Office of Nuclear Reactor Regulation, NRC. This program started with a reevaluation of the risks reported in the Zion and Indian Point Probabilistic Safety Studies (PWRs with large dry containments) and was followed by reviews of the Limerick (BWR with Mark II containment) and Big Rock Point (early BWR design) PRAs. Reviews of the GESSAR-II (BWR with a Mark III containment) and Millstone-3 (PWR with a subatmospheric containment) PRAs are nearing completion. This paper therefore presents the insights gained from extensive reevaluations of the risk associated with a wide range of reactor and containment designs. In particular, the paper shows how changing methodology has influenced our understanding of containment performance under degraded core conditions and how this influences the frequency, timing and magnitude of fission product release to the environment, which in turn impacts potential off-site consequences.

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The Electric Power Research Institute has sponsored an in-depth survey of five significant probabilistic risk assessments (PRAs) to provide a summary and an interpretation to help technical specialists and management personnel understand the state-of-the-art in risk assessment, the validity of the methods used and the conclusions reached. This paper summarizes the insights gained from the Phase II comparison of containment analyses. It then describes techniques, independently developed and implemented at NUS Corporation, that address some of the shortcomings identified herein. Two specific areas of containment analyses are discussed. These are: 1) assessment of the probability and mode of containment failure as a result of internal loadings and 2) quantification of phenomenological events in the containment event trees.

30883 (EPRI-NP—3912-SR-Vol.1, pp 25.1-25.13) **Containment failure pressure analysis for the Seabrook Station Probabilistic Safety Assessment.** Torri, A.; Peek, R. (Pickard, Lowe and Garrick, Inc., Newport Beach, CA). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

A comprehensive containment failure pressure analysis was performed to quantify best estimate failure pressures for a range of gross structural failure modes and local controlled leakage failure modes. Uncertainties in the failure pressures were quantified as probability distributions. Dependencies between failure modes were explicitly treated and composite probability distributions were determined for the gross structural failure pressure and for the controlled leak failure pressure. A conditional probability for controlled leak failure, given that failure occurs, was also developed as a function of pressure. The Seabrook Station containment is unusually strong. The composite median failure pressure is 172 psig for dry conditions and 195 psig for wet conditions, compared to a design pressure of 52 psig. At these pressures, the conditional probability for a controlled leak failure ranges from 0.76 to 0.88. At pressures likely to be reached early under accident conditions (125 psig or less) the containment failure probability is on the order of 10^{-4} or less and the controlled leak failure fraction is 0.04 or less. The conclusions are design-specific.

30884 (EPRI-NP—3912-SR-Vol.1, pp 26.1-26.11) **Consistent probabilistic methodology for the Seabrook Station containment event tree analysis.** Torri, A. (Pickard, Lowe and Garrick, Inc., Newport Beach, CA). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

A containment response analysis includes a quantification of accident progression, containment failure, and source terms. A consistent and fully probabilistic methodology was developed and applied in the Seabrook probabilistic risk assessment (PRA). A wide range of deterministic accident analyses were used as input to the probabilistic quantification of the containment event tree. The methodology embraces the definition of initial conditions, criteria for selecting top events, a probabilistic quantification of top event split fractions and the interpretation and propagation of uncertainties. The correct probabilistic interpretation of top event split fractions as uncertainties of deterministic events instead of frequencies of random events has important implications in the final risk results, when risk is stated in a probability of frequency format; that is, when the uncertainties in the frequency of consequences are explicitly quantified.

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

One of the objectives of the Severe Accident Risk Reduction Program (SARRP) is to benchmark the risks from nuclear power plants. In order to accomplish this not only are estimates of the potential consequences from hypothetical reactor accidents needed; but estimates of the frequency of occurrence of such consequences must also be made since it is the combination of frequency and consequences which determine risk. The approach taken in SARRP to address this problem is to develop containment event trees which proceed from an accident sequence to different possibilities of fission product releases. This paper deals with the development of the containment event trees and treats the selection procedure used for estimating the branch point probabilities are shown for two sequences at a subatmospheric PWR.

30886 (EPRI-NP—3912-SR-Vol.1, pp 29.1-29.13) **Evaluation of containment failure modes and fission product releases during core meltdown accidents in a BWR with a Mark III containment.** Ludewig, H.; Yu, W.S.; Jaung, R.; Pratt, W.T. (Brookhaven National Lab., Upton, NY). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

In this paper an assessment is described of potential failure modes and fission product releases for a large number of postulated core meltdown accidents in a BWR with a Mark III containment. For this containment design, the most important failure mode was found to be due to hydrogen related phenomena. A one-dimensional lumped parameter computer code has been developed and used to determine the probability of various hydrogen phenomena for a range of postulated core meltdown sequences. Potential containment loads have been estimated and compared against the containment capacity to determine the probability of containment failure. The fission product release assessment began by using the MARCH/CORRAL system of codes with key input parameters varied over a reasonable range. The parameters relate to primary system retention, re-emission, pool scrubbing, and fission product release in-vessel vs. ex-vessel. The final step used more mechanistic calculations based on the system of codes recently developed under sponsorship of the Accident Source Term Program Office, NRC, and compares these predictions with the range of releases calculated in the sensitivity study.

30887 (EPRI-NP—3912-SR-Vol.1, pp 30.1-30.10) **PWR S_2D sequence analysis with THALES code system.** Abe, K.; Nishi, M.; Watanabe, N.; Kobayashi, K.; Kudo, K. (Japan Atomic Energy Research Institute, Tokyo). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The Japan Atomic Energy Research Institute (JAERI) has been developing the computer code system THALES which analyzes the progress of the core meltdown accident for the purpose of risk analysis. With the code system, a series of studies were conducted for the PWR S_2D sequence (small break LOCA without ECCS), which consisted of: 1) a thorough analysis of an assumed sequence from beginning to end; 2) a sensitivity study for the in-vessel accident progress; and 3) a sensitivity study for the ex-vessel accident progress. The objectives of the studies were firstly to evaluate the performance of the code system and secondly to identify the important parameters in this sequence. In this report, after a brief description of THALES, the principal assumptions and the results of each study are described.

30888 (EPRI-NP—3912-SR-Vol.1, pp 31.1-31.4) **Opening remarks: regulatory initiatives toward improved technical specifications.** Edison, G.E. (Nuclear Regulatory Commission, Washington, DC). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

In order to deal with the numerous problems that have evolved over the years with nuclear power plant technical specifications, the Nuclear Regulatory Commission has undertaken some initiatives for improvement: 1) new operating licenses, 2) change to existing operating reactor technical specifications, 3) a broad-scoped reconsideration of the content of technical specifications, and 4) rule changes. It is believed that reliability and risk assessment techniques can be used in conjunction with manufacturer's recommendations and engineering judgment to better define the appropriate scope and depth for technical specification resulting in focusing attention on high risk-worth systems and avoidance of plant shutdown transients both intentionally and unintentionally through provisions of technical specifications.

30889 (EPRI-NP—3912-SR-Vol.1, pp 32.1-32.8) **Methodology for risk-based analysis of technical specifications.** Vesely, W.E.; Gaertner, J.P.; Wagner, D.P. (Battelle Columbus Labs., OH). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

Part of the effort by EPRI to apply probabilistic risk assessment methods and results to the solution of utility problems involves the investigation of methods for risk-based analysis of technical specifications. The culmination of this investigation is the SOCRATES computer code developed by Battelle's Columbus Laboratories to assist in the evaluation of technical specifications of nuclear power plants. The program is designed to use information found in PRAs to re-evaluate risk for changes in component allowed outage times (AOTs) and surveillance test intervals (STIs). The SOCRATES program is a unique and important tool for technical specification evaluations. The detailed component unavailability model allows a detailed analysis of AOT and STI contributions to risk. Explicit equations allow fast and inexpensive calculations. Because the code is designed to accept ranges of parameters and to save results of calculations that do not change during the analysis, sensitivity studies are efficiently performed and results are clearly displayed.

30890 (EPRI-NP—3912-SR-Vol.1, pp 33.1-33.12) **Experiences from the use of PRA methods in the re-evaluation of technical specifications.** Mankamo, T.; Perhonen, H.; Pulkkinen, U.; Kosonen, M.; Vanhala, J. (Technical Research Centre of Finland, Espoo). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

Extensive research and development work has been connected on a series of studies dealing with the optimization of test schemes and limiting conditions of operation (LCO) for stand-by safety systems. The studies were originally started on a common initiative from the Finnish Centre for Radiation and Nuclear Safety (the national authority) and the Technical Research Centre of Finland. This paper updates an earlier paper, which was limited to the question of the allowable repair down-time during operation. The emphasis here is on the recent method developments, and experiences from the current practical applications are discussed. In addition to method development much work has been required to collect relevant data for model parameters. Analyzing component and system histories have also provided valuable information for verification or modification of the models and assumptions. Thus far data analyses have been done for diesel generators, closing valves and pumps.

30891 (EPRI-NP—3912-SR-Vol.1, pp 34.1-34.15) **TOP: Technical Specification Optimization Program.** Lijewski, L.M.; Jansen, R.L. (Westinghouse Electric Corp.). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The Westinghouse Technical Specification Optimization Program has been specifically developed to quantitatively assess proposed revisions to current nuclear power plant technical specifications. This program is a direct response to both industry and regulatory concerns as to the impact of technical specification requirements on plant operation, particularly instrumentation systems. A fault tree methodology which quantifies system unreliability and sensitivity to test and maintenance practices has been applied to typical Westinghouse reactor protection system designs. Reactor trip features and engineered safety features have both been analyzed. Technical specification revisions evaluated include: extended surveillance intervals, extended test and maintenance times, and testing in the bypass mode. This methodology and the analysis results present a justifiable quantitative basis for technical specification revisions.

30892 (EPRI-NP—3912-SR-Vol.1, pp 37.1-37.7) **Evaluation of allowed outage time using PRA results.** Johanson, G. (System Engineering, Sweden). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

In a probabilistic risk assessment (PRA) different measures of risk importance can be established. These measures can be used as a basis for further evaluation and determination of allowed outage time for specific components, within safety systems of a nuclear power plant. In order to optimize the allowed outage time (AOT) stipulated in the plant's Technical Specification it is necessary to create a methodology which could incorporate existing PRA data into a quantitative extrapolation. In order to evaluate the plant risk status due to AOT in a quantitative manner, the risk achievement worth is utilized. Risk achievement worth is defined as follows: to measure the worth of a feature, in achieving the present risk, one approach is to remove the feature and then determine how much the risk has increased. Thus, the risk achievement worth is formally defined to be the increase in risk if the feature were assumed not be there or to be failed. Another parameter of interest for this analysis is the shutdown risk increase. The shutdown risk achievement worth must be incorporated into the accident sequence risk achievement worth to arrive at an optimal set of plant specific AOTs.

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

Recently, several nuclear power plants have been upgrading their onsite data processing capabilities to take advantage of state-of-the-art advancements in data acquisition, data base management and computer hardware. These capabilities can now provide plant personnel with ready access to detailed information on every phase of equipment and administrative activity in the plant. However, the engineering and operational applications are just starting to be realized. At the Electric Power Research Institute (EPRI), a broad scope, ongoing research project entitled "Use of PRA Methods for Enhancing Plant Operational Safety and Reliability" is intended to develop a systematic and integrated approach to maximize the utilization of the plant data base system. Specifically, the project consists of two major activities: (1) to develop a user friendly, integrated computer software package, RAPID (Reliability Analysis Program with In-Plant Data), to perform these engineering and operational tasks and (2) to demonstrate the technical feasibility and practical usefulness of RAPID onsite. One of the initial efforts of this program is directed toward the development of a plant configuration and status monitoring system. As a part of the effort, EPRI is sponsoring a limited demonstration study of the concept. This paper describes the technical issues and approaches used in this phase of the demonstration study.

30894 (EPRI-NP—3912-SR-Vol.1, pp 39.1-39.10) **Essential systems status monitor.** Horne, B.E.; Pullen, R.A. (Central Electricity Generating Board, Gloucester, England). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The operation of a nuclear power station requires that safety objectives are adequately satisfied in order to assure the safety of the operators and the general public. For the safety objectives to be satisfied, the essential systems of a nuclear power station are installed and operated with considerable redundancy in plant and equipment. It is a necessary requirement that in the presence of faults or outages of plant due to maintenance this redundancy is always maintained to an acceptable level. The Essential Systems Status Monitor (ESSM) is a computerized facility which is capable of quickly assessing the implications of plant outages on the integrity of the essential systems. The speed of response of the ESSM allows it to be used in an operating environment where it can also provide assistance in scheduling plant items for maintenance and assigning priorities for plant restoration. The ESSM is not restricted by the size, complexity and interrelation of the essential systems. The ESSM provides the operator with an air for assessing the integrity of available essential systems against the minimum requirements in a less pessimistic manner, thereby increasing the availability of the power station overall.

(Commission of the European Communities, Ispra, Italy). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The paper revises the aims and objectives of the European Reliability Data System (ERDS), a centralized system collecting and organizing information related to the operation of light water reactors. The paper first describes the recent developments of the four data banks constituting the system: Component Event Data Bank, Abnormal Occurrences Reporting System, Operating Unit Status Report and Reliability Parameters Data Bank. Then several issues are discussed referring mostly to the status of classification schemes and their use, to the operation of the banks (data input and transcoding) and to the retrieval and utilization of the information; in this latter case particularly the analysis potential of the data collection scheme of the AORS (Abnormal Occurrences Reporting System) is demonstrated. Finally, emphasis is given to the increasing role which artificial intelligence techniques such as natural language and expert systems and fuzzy logic may play in improving the future capabilities of the system.

30896 (EPRI-NP—3912-SR-Vol.1, pp 42.1-42.10) **Operating experience analysis contribution to probabilistic risk assessment: development and use of EDF data collection systems.** Meslin, T.; Lienart, P. (Electricite de France). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

EDF is developing probabilistic studies concerning beyond-design accidents of a 1300 Mw pressurized water reactor. Specifically the following three studies have been made: 1) components reliability for evaluating the unavailability and failure rates of the auxiliary feedwater system; 2) initiating event analysis of the loss of the normal feedwater system; and 3) setting up of a typical operating profile of a PWR standard unit. Implementation of the operating experience analysis has led to the precise identification and estimate of all initiating events which would induce total loss of normal feedwater and thus supports the probabilistic study of beyond-design accidents.

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The ATV-system, the Scandinavian Nuclear Power Reliability Data System, was developed during the late seventies and in the summer of 1980 the first reliability parameters were presented from the complete system. The main goal of the ATV-system is to produce reliability data and the appendant failure statistics for components of technical systems of importance for either the power production or the safety of the units. In order to achieve this, modern information system theory and advanced data processing techniques are used. Another important feature is the close cooperation with the local maintenance management system. Activities of importance for efficiency of power production which the system is to support with relevant data are reliability analyses, availability analyses, life cycle cost analyses, probabilistic risk assessments, planning and performance of maintenance, spare parts optimization, and trend analyses.

30898 (EPRI-NP—3912-SR-Vol.1, pp 44.1-44.7) **Applications of NPRDS data to enhance nuclear plant design and operations.** Simard, R.L. (Institute of Nuclear Power Operations, Atlanta, GA). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The Nuclear Plant Reliability Data System (NPRDS) is managed by the Institute of Nuclear Power Operations (INPO) on behalf of the US nuclear utility industry. All US nuclear plants in commercial operation, absent three early-vintage units, supply detailed design data and failure reports on some 4000-5000 plant components from 30 systems important to safety or plant availability. Recent enhancements to NPRDS have significantly improved the completeness, timeliness, and quality of reporting. This has lead to increased usage of the data, especially by utility departments involved with plant design, maintenance, and operational support.

30899 (EPRI-NP—3912-SR-Vol.1, pp 45.1-45.9) **Analysis and use of operating experience in probabilistic risk assessment.** Apostolakis, G. (Univ. of California, Los Angeles). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The purpose of this paper is to discuss several issues that arise when operating experience is used to develop or modify failure rate distributions. The main reasons for the existence of these issues are: 1) The events of interest are usually rare, therefore the statistical evidence is weak, or even nonexistent. This necessitates the use of evidence or judgments that may be debatable and controversial. 2) The data sources have not been designed to support probabilistic risk assessments (PRA). The definition and cause of failure as well as the numbers of failures and trials, if reported at all, depend very much on the purposes of the reporting system, which may or may not coincide with those of a probabilistic assessment. In this paper, the author first discusses several issues that arise when the operating experience is interpreted. The use of models to guide the analysts in the search for evidence is pointed out and some issues that may affect the relevance of the evidence are raised. The second part of the paper deals with the mathematical analysis of the evidence. The controversial issue of objectivity is discussed, as well as some issues related to the use of judgment. Finally, practical cases, where the issues that are raised are important, are presented.

30900 (EPRI-NP—3912-SR-Vol.1, pp 47.1-47.8) **Distributions of component failure rates, estimated from LER data.** Atwood, C.L. (EG and G Idaho, Inc., Idaho Falls). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

Past analyses of Licensee Event Report (LER) data have noted that component failure rates vary from plant to plant, and have estimated the distributions by two-parameter γ distributions. In this study, a more complicated distributional form is considered, a mixture of γs. This could arise if the plants' failure rates cluster into distinct groups. The method was applied to selected published LER data for diesel generators, pumps, valves, and instrumentation and control assemblies. The improved fits from using a mixture rather than a single γ distribution were minimal, and not statistically significant. There seem to be two possibilities: either explanatory variables affect the failure rates only in a gradual way, not a qualitative way; or, for estimating individual component failure rates, the published LER data have been analyzed to the limit of resolution.

30901 (EPRI-NP—3912-SR-Vol.1, pp 48.1-48.10) **Development of a generic data base for failure rate.** Mosleh, A.; Apostolakis, G. (Pickard, Lowe and Garrick, Inc., Newport Beach, CA). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The data analysis task in a probabilistic risk assessment (PRA) involves the assessment of data needs, the collection of information, and, finally, the analysis of the data to generate estimates for various parameters. This paper describes a framework for developing a data base for component failure rates and presents mathematical methods for the analysis of various types of information. The discussion is focused on the development of generic data bases used in PRAs. For plants without an operating history, the generic distributions are used directly to calculate component unavailability. In the case of plants that have operated for some time, the generic distributions can be used as priors in Bayesian analysis and, thus, specialized by plant-specific experience.

30902 (EPRI-NP—3912-SR-Vol.1, pp 49.1-49.13) **Tectonic framework methodology for developing seismic source zones in the eastern United States.** Stepp, J.C.; Coppersmith, K.; King, J.L. (Electric Power Research Institute, Palo Alto, CA). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The focus of a current EPRI research program is the development of a state-of-the-art method of seismic hazard analysis applicable in intraplate regions. The program emphasis is on the interpretation and resulting ground motions from seismic source zones that are capable of producing moderate-to-large (magnitude 5.0 or greater) earthquakes. The basis for seismic source zone development is a tectonic framework that includes tectonic structures or features interpreted to have any potential for generating moderate or large earthquakes. The approach developed for tectonic framework interpretation is a unique relative to standard hazard analyses because it is based on assessments of the current tectonic stress regime and the potential response of tectonic structures to the applied stresses. A structured approach for evaluating the probability that tectonic features of the tectonic framework capable of producing moderate-to-large earthquakes has been developed that explicitly quantifies both scientific uncertainty about earthquake processes and informational uncertainty due to inadequate data. This structured approach provides fully trackable documentation of the reasoning behind seismic source zones of any complexity derived from the tectonic framework.

30903 (EPRI-NP—3912-SR-Vol.1, pp 51.1-51.9) **Role of seismic PRA in seismic safety decisions of nuclear power plants.** Ravindra, M.K.; Kennedy, R.P.; Sues, R.H. (NTS/Structural Mechanics Associates, Newport Beach, CA). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

This paper highlights the important roles that seismic probabilistic risk assessments (PRAs) can play in the seismic safety decisions of nuclear power plants. If a seismic PRA has been performed for a plant, its results can be utilized to evaluate the seismic capability beyond the safe shutdown event (SSE). Seismic fragilities of key structures and equipment, fragilities of dominant plant damage states and the frequencies of occurrence of these plant damage states are reviewed to establish the seismic safety of the plant beyond the SSE level. Guidelines for seismic margin reviews and upgrading may be developed by first identifying the generic classes of structures and equipment that have been shown to be dominant risk contributors in the completed seismic PRAs, studying the underlying causes for their contribution and examining why certain other items (e.g., piping) have not proved to be high-risk-contributors.

30904 (EPRI-NP—3912-SR-Vol.1, pp 52.1-52.6) **Uncertainties in the systems analysis part of seismic probabilistic risk assessment.** Budnitz, R.J.; Lambert, H.E. Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

This project has had as its principal objective the identification of methodological improvements in the systems analysis part of seismic probabilistic risk assessments (PRAs) performed on large nuclear power plants. Methods used in the following PRAs have been examined, with emphasis on areas where the systems analysis may have introduced approximations or may have inadequately modeled plant behavior: the Indian Point-2 and -3 PRA; the Zion-1 and -2 PRA; the Limerick PRA; and the SSMRP study of Zion. The following areas are discussed briefly: 1) level of detail in systems modeling; 2) modeling of operator response; 3) control and instrumentation failures and support system failures; and 4) modeling of equipment inside or dependent upon a structure.

30905 (EPRI-NP—3912-SR-Vol.1, pp 53.1-53.10) **Method for evaluation of risk due to seismic related design and construction errors based on past reactor experience.** Gonzalez Cuesta, M.; Okrent, D. (Univ. of California, Los Angeles). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

This paper proposes a methodology for quantification of risk due to seismic related design and construction errors in nuclear power plants, based on information available on errors discovered in the past. For the purposes of this paper, an error is defined as any event that causes the seismic safety margins of a nuclear power plant to be smaller than implied by current regulatory requirements and industry common practice. Also, the actual reduction in the safety margins caused by the error will be called a deficiency. The method is based on a theoretical model of errors, called a deficiency logic diagram. First, an ultimate cause is present. This ultimate cause is consumated as a specific instance, called originating error. As originating errors may occur in actions to be applied a number of times, a deficiency generation system may be involved. Quality assurance activities will hopefully identify most of these deficiencies, requesting their disposition. However, the quality assurance program is not perfect and some operating plant deficiencies may persist, causing different levels of impact to the plant logic. The paper provides a way of extrapolating information about errors discovered in plants under construction in order to assess the risk due to errors that have not been discovered.

30906 (EPRI-NP—3912-SR-Vol.1, pp 55.1-55.8) **Internal flooding: methods and results from the Oconee PRA.** Sugnet, W.R.; Lewis, S.R.; Boyd, G.J. (Electric Power Research Institute, Palo Alto, CA). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The importance of internal flooding events for Oconee was determined by successively more detailed flood analyses. The methods used provide a model of the flood sequences that is as realistic and reproducible as that for the internal initiators. The authors conclude that with sufficient care and detail, analysis of most external events (the exception being seismic events within today's state-of-the-art) can be made to be the same caliber as that for internal events. The use of more detailed methods also provided a complete enough picture of the integrated effects of flooding on the plant to allow a meaningful evaluation of modifications to improve that plant's ability to withstand major floods. With the perspective provided by the PRA evaluations, it was possible to identify an effective set of modifications, many of which were inexpensive relative to the significant improvement they offered in the estimated frequency of core damage.

30907 (EPRI-NP—3912-SR-Vol.1, pp 56.1-56.8) **Modeling the detection and suppression of fires in nuclear power plants.** Siu, N.; Apostolakis, G. (Univ. of California, Los Angeles). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The potential occurrence of fire damage to components can be modeled as the outcome of a competition between fire growth and fire suppression processes over time. To outline the time-dependent competing processes approach, assume that a fire has started at time t = 0, and that the fire size and room configuration are such that, if the fire is not suppressed, it will grow large enough to cause the loss of critical cables in Tray X at time t = T/sub G/. Then, if the fire actually burns until time t = T/sub H/, when it is suppressed, the conditional frequency of damage, given that the fire occurs, can be defined. In this paper, the authors outline a model for the fire hazard time T/sub H/, which accounts for the presence of site-specific fire protection features. It incorporates both data on the overall success rate of the various possible detection and suppression modes and on the characteristic rates associated with these modes. Uncertainties in the parameters of the model are fully quantified. To illustrate the use of this model in a fire risk study, a hypothetical scenario is analyzed.

30908 (EPRI-NP—3912-SR-Vol.1, pp 58.1-58.8) **Accident simulator development for probabilistic safety analysis.** Cacciabue, P.C.; Amendola, A.; Mancini, G. (Commission of the European Communities, Ispra, Italy). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

This paper describes the basic features of a new concept of incident simulator, Response System Analyzed (RSA) which is being developed within the CEC JRC Research Program on Reactor Safety. Focusing on somewhat different aims than actual simulators, RSA development extends the field of application of simulators to the area of risk and reliability analysis and in particular to the identification of relevant sequences, to the modeling of human behavior and to the validation of operating procedures. The fundamental components of the project, i.e. the deterministic transient model of the plant, the automatic probabilistic driver and the human possible intervention modeling, are discussed in connection with the problem of their dynamic interaction. The analyses so far performed by separately testing RSA on significant study cases have shown encouraging results and have proven the feasibility of the overall program.

30909 (EPRI-NP—3912-SR-Vol.1, pp 62.1-62.10) **Core damage frequency results for the Clinch River Breeder Reactor.** Akhtar, M.W.; Stutzke, M.A. (Technology for Energy Corp., Knoxville, TN). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1). Contract AC15-83CL01819.

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

A probabilistic risk assessment (PRA) for the Clinch River Breeder Reactor Plant (CRBRP) was recently completed by Technology for Energy Corporation, Knoxville, Tennessee, for the Department of Energy, Oak Ridge Operations Office. The PRA was performed in two phases with the second phase starting in January 1983. Phase II activities were originally planned to result in a Level 3 PRA with full-scope analysis of the external and common-cause events, as well as ex-core sources. The Phase II activities were cut short because of the termination of the CRBRP Project in November of 1983, at which point the scope of the PRA was changed to the following goals: 1) complete the CRBRP system models; 2) calculate the plant core-damage frequency; 3) study the core and containment phenomena in a probabilistic sense; 4) determine the design features important to plant safety, and therefore important to any considerations of new designs for liquid-metal reactors; and 5) extensively document the PRA to enable its use for other programs. This paper summarizes the frequency of core-damage accidents as assessed by this study. The discussion also includes the important design operational elements of the CRBRP that affect these results. A short overview of the methodology used is also provided.

30910 (EPRI-NP—3912-SR-Vol.1, pp 63.1-63.10) **Use of PRA methodology for enhancing operational safety and reliability.** Chu, B.; Rumble, E.; Najafi, B.; Putney, B.; Young, J. (Electric Power Research Institute, Palo Alto, CA). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

This paper describes a broad scope, on-going R and D study, sponsored by the Electric Power Research Institute (EPRI) to utilize key features of the state-of-the-art plant information management and system analysis techniques to develop and demonstrate a practical engineering tool for assisting plant engineering and operational staff to perform their activities more effectively. The study is foreseen to consist of two major activities: to develop a user-friendly, integrated software system; and to demonstrate the applications of this software on-site. This integrated software, Reliability Analysis Program with In-Plant Data (RAPID), will consist of three types of interrelated elements: an Executive Controller which will provide engineering and operations staff users with interface and control of the other two software elements, a Data Base Manager which can acquire, store, select, and transfer data, and Applications Modules which will perform the specific reliability-oriented functions. A broad range of these functions has been envisaged. The immediate emphasis will be focused on four application modules: a Plant Status Module, a Technical Specification Optimization Module, a Reliability Assessment Module, and a Utility Module for acquiring plant data.

30911 (EPRI-NP—3912-SR-Vol.1, pp 66.1-66.9) **Nuclear power plant design: contribution of probabilistic methods and their application to a total loss of electric power supplies.** Schektman, N.; Villemeur, A.; Berger, J.P.; Boisseau, J.; Dubreuil-Chambardel, A.; Mosneron-Dupin, F.; Septen, E.D.F. (Electricite de France). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The approach to safety in France has long been based on the conventional deterministic technique and hence on the defense in-depth principle. For this purpose, a set of operating conditions - normal, upset, accident conditions - considered representative, is defined and used to design the regulating, protective and engineered safety feature systems required to cope with these conditions. For the studies, the single failure criterion is taken into account. These principles are sufficient to design a unit but EDF has pursued its reflection work with the intention of improving safety. In the framework of this special effort, attention had to be focused on states which lie outside the previously defined scope and occur under conditions close to or beyond design basis conditions. These efforts have resulted in the development of operating procedures based on the use of available devices or of additional means specially designed for the so-called beyond design basis operating conditions. The first study devoted to this subject concerned the total loss of electric power supplies. The chosen methodology as well as the results obtained are presented.

30912 (EPRI-NP—3912-SR-Vol.1, pp 68.1-68.9) **System to forecast health effects in order to determine necessary counter-measures in case an accidental atmospheric release.** Merchant, T.E.; Parmentier, N. (Institut de Protection et de Surete Nucleaire, Fontenay-aux-Roses, France). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

In most accident situations involving radioactivity, the required data are the quantitative evaluation of the relevant constituents of the release and the dose factors applicable for these constituents. In the problem of an atmospheric release of radioactivity a third group of data also comes into play, the meteorological conditions at the site and time of the accident. The solution to this problem is the construction of a computer code which, by employing acquired compositions of the release as well as physical accident conditions (at the time of the incident), can be effectively run to calculate and present useful dosimetric data. To meet this need, an interactive computer program has been constructed by the Institut de Protection et de Surete Nucleaire of the Commissariat a l'Energie Atomique which calculates the gamut of dosimetric and statistical information for a region of accidental radiological concern. Application of the program is such that it outputs dosimetric information and other important data in a form independent of the site under consideration, allowing, at the same time, the computation of the same information for areas where demographics show them to be of the highest radiological concern. All this is done after requiring minimal user input.

30913 (EPRI-NP—3912-SR-Vol.1, pp 69.1-69.15) **Natural methodology for establishing safety goal compliance requirements on a plant specific basis.** Unione, A.J.; Lim, J.J. (Lotus Reliability Associates, Inc., Los Altos, CA). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

Defining reliability assurance criteria on a plant specific basis requires: 1) additional consideration be given to an appropriate process by which overall design objectives are translated into reliability requirements; 2) considerable flexibility be maintained in the process by which reliabilities are forecast and assured; and 3) reasonably fast and interactive techniques be developed for evaluating plant events for potential importance as contributors to a higher than acceptable level of plant safety function failures. An approach which implements these recommendations and which is cost effective for plant specific applications is advocated. This approach is based upon the following technical elements: 1) development of simplified plant risk models called macromodels which can be used to define appropriate levels of detail for reliability assurance requirements, 2) performance of calculations using the plant macromodel which assess the importance of a given set of equipment (usually a system) as a contributor to plant risk measures. 3) performance of sensitivity and uncertainty calculations which identify the potential for variability in risk measures and in system importances given that ranges or distributions of system and subsystem reliabilities are used in the macromodel; 4) the identification of high availability contributors in highly critical systems by means of system reviews of plant systems (or reviews of operating data if available).

30914 (EPRI-NP—3912-SR-Vol.1, pp 70.1-70.8) **Accident sequence identification for Indian PHWRs.** Grover, R.B.; Chakraborty, G.; Gangwal, D.K.; Mehra, V.K.; Mehta, S.K.; Babar, A.K. (Bhabha Atomic Research Center, Bombay, India). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1).

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

In order to assess accident sequence vulnerability of PHWRs being designed in India, it was decided to identify important initiating events and to prepare event trees of such events. This paper summarizes the work done in this area and lessons learned.

30915 (EPRI-NP—3912-SR-Vol.1, pp 71.1-71.7) **Advanced design of PWR through probabilistic safety analysis.** Sobottka, H.; Fabian, H. (Kraftwerk Union AG, Offenbach, West Germany). Feb 1985. From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

The KWU NPP is designed on the basis of deterministic oriented criteria, requirements and on a licensing procedure with a well-established set of rules, e.g. safety criteria by the German Ministry of Interior, guidelines of the German Reactor Safety Commission. Safety is achieved by carefulness of plant design, quality assurance, operation and surveillance of plant. The assurance of normal operating conditions and the prevention of incidents through control result in extraordinary plant load factors of KWU-PWR. With this background there would be no need for probabilistic analysis in licensing or for a fundamental review of the design. Nevertheless PSA are very useful to demonstrate and quantify safety margins of engineered safety features. Furthermore PSA can be used to check the existing design with respect to a balanced concept or any possibility for streamlining the concept. For this purpose a systematic reliability analysis of each active or passive function has to be performed. Then the result of these analyses have to be evaluated in connection with those incidents and accidents which influence the design. This procedure is illustrated at the following examples: accumulator injection, steam generator feeding, and reactor building design.

30916 (EPRI-NP—3912-SR-Vol.1, pp 72.1-72.11) **Demonstration uncertainty/sensitivity analysis using the health and economic consequence model CRAC2.** Alpert, D.J.; Iman, R.L.; Johnson, J.D.; Helton, J.C. (Sandia National Labs., Albuquerque, NM). Feb 1985. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $125.00. File Number TI85920509. (CONF-850206—Vol.1). Contract AC04-76DP00789.

From International ANS/ENS topical meeting on probabilistic safety methods and applications; San Francisco, CA, USA (24 Feb 1985).

This paper summarizes a demonstration uncertainty/sensitivity analysis performed on the reactor accident consequence model CRAC2. The study was performed with uncertainty/sensitivity analysis techniques compiled as part of the MELCOR program. The principal objectives of the study were: 1) to demonstrate the use of the uncertainty/sensitivity analysis techniques on a health and economic consequence model, 2) to test the computer models which implement the techniques, 3) to identify possible difficulties in performing such an analysis, and 4) to explore alternative means of analyzing, displaying, and describing the results. Demonstration of the applicability of the techniques was the motivation for performing this study; thus, the results should not be taken as a definitive uncertainty analysis of health and economic consequences. Nevertheless, significant insights on health and economic consequence analysis can be drawn from the results of this type of study. Latin hypercube sampling (LHS), a modified Monte Carlo technique, was used in this study. LHS generates a multivariate input structure in which all the variables of interest are varied simultaneously and desired correlations between variables are preserved. LHS has been shown to produce estimates of output distribution functions that are comparable with results of larger random samples.

30917 **(EPRI-NP—3975) Analysis of the hydrogen burn in the TMI-2 containment. Final report.** Zalosh, R.G.; Beier, R.A.; Dean, R.K.; Earley, M.W.; Ural, E.A. (Factory Mutual Research Corp., Norwood, MA (USA)). Apr 1985. 92p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920616.

A comprehensive analysis of the TMI-2 hydrogen deflagration is descibed encompassing hydrogen generation/release rates, hydrogen mixing prior to the burn, likely ignition sources, combustion and cool-down phenomena, and burn-induced mechanical and thermal damage. The analysis independently leads to conclusions that agree in most aspects with those reached in previous TMI burn studies. In addition, new conclusions are also reached to quantify hydrogen concentration non-uniformities; to identify a few most plausible ignition sources; to interpret peak pressures and pressure rise times in terms of turbulent flame propagation parameters; and to explain the observed minor localized mechanical damage and the thermal degradation of some exposed electrical cables.

30918 **(EPRI-NP—4033) Clad interface crack detection and sizing. Final report.** Johansen, F.P. (Sigma Research, Inc., Richland, WA (USA)). May 1985. 65p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920657.

A test program to evaluate methods of detecting cracks in sample blocks that simulate conditions and features found beneath production-type austenitic weld cladding in nuclear reactor pressure vessels has been developed. During the project, two blocks (2 feet square) were fabricated from A-533 plate steel, and multiple flaws were machined in their surfaces, which were subsequently faced with wire- and strip-cladding. The machined defects were characterized by radiography and ultrasonics. The test program includes procedures to screen multiple inspection techniques, and a statistical analysis program has been formulated to process the resulting data. An ultrasonic interferometric technique was developed to size underclad cracks, but signal-to-noise problems limited its usefulness. Continued test efforts and future sample block designs are being discussed. 89 refs., 15 figs.

30919 **(EPRI-NP—4043) Assessment of dynamic fracture mechanics for the analysis of crack arrest in a pressurized thermal shock event. Final report.** Kanninen, M.F.; Ahmad, J.; Papaspyropoulos, V.; Hudak, S.J.; FitzGerald, J.H. (Southwest Research Inst., San Antonio, TX (USA)). May 1985. 54p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920654.

The objective of this project was to assess the feasibility of a dynamic fracture mechanics approach for use in analyses of postulated pressurized thermal shock (PTS) events in nuclear pressure vessels. The work focused on a high strength steel (type 4340) and employed linear elastic fracture mechanics concepts exclusively. Four specific tasks were performed. These were to (1) conduct dynamic crack run/arrest experiments in different temperature and crack speed regimes, (2) perform generation-phase elastodynamic finite element analyses of the experiments to obtain dynamic fracture toughness properties, (3) extrapolate these results to develop an approximate representation of the dynamic fracture toughness of nuclear pressure vessel steel, and (4) use this property to compute run/arrest behavior under a typical PTS condition. It was found that the crack arrest toughness data obtained via a dynamic fracture mechanics approach was largely in agreement with the 4340 steel data obtained (in a much complex manner) by other investigators. More significantly, the feasibility of applying the procedures developed in this research for PTS analyses was conclusively demonstrated. These results also indicate that, while dynamic effects must be considered in obtaining crack arrest data from small-scale specimen testing, static analysis may suffice for evaluating crack arrest in a nuclear pressure vessel. Recommendations are given for the further research that is needed to enable practical use of the approach developed in this work. 18 refs., 20 figs., 2 tabs.

30920 **(EUR—6537) RL5SORT/RL5PLOT. A graphite package for the JRC-Ispra IBM version of RELAP5/MOD1.** Kolar, W.; Brewka, W. (Commission of the European Communities, Luxembourg; Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1984. 46p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701522.

The present report describes the programs RL5SORT and RL5PLOT, their implementation and "how to use". Both programs base on the IBM version of RELAP5 as developed at JRC-ISPRA. RL5SORT creates from the output file (restart plot file) of a RELAP5 calculation data files, which serve as input data base for the program RL5PLOT. RL5PLOT retrieves the previous stored data records (minor edit quantities of RELAP5), allows arithmetic operations with the retrieved data and enables a print or graphic output on the terminal screen of a TEKTRONIX graphic terminal. A set of commands, incorporated in the program RL5PLOT, facilitates the user's work. Program RL5SORT has been developed as a batch program, while RL5PLOT has been conceived for interactive working mode.

30921 **(EUR—6538) Implementation of the CDC version of RELAP5/MOD1/019 on an IBM compatible computer system (AMDAHL 470/V8).** Kolar, W.; Brewka, W. (Commission of the European Communities, Luxembourg; Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1984. 38p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701493.

RELAP5/MOD1 is an advanced one-dimensional best estimate system code, which is used for safety analysis studies of nuclear pressurized water reactor systems and related integral and separate effect test facilities. The program predicts the system response for large break, small break LOCA and special transients. To a large extent RELAP5/MOD1 is written in Fortran, only a small part of the program is coded in CDC assembler. RELAP5/MOD1 was developed on the CDC CYBER 176 at INEL. The code development team made use of CDC system programs like the CDC UPDATE facility and incorporated in the program special purpose software packages. The report describes the problems which have been encountered when implementing the CDC version of RELAP5/MOD1 on an IBM compatible computer systems (AMDAHL 470/V8).

30922 **(EUR—8920-Pt.1) RODSWELL: a computer code for the thermomechanical analysis of fuel rods under LOCA conditions. Part I: models and code description.** Casadei, F.; Laval, H.; Donea, J.; Jones, P.M.; Colombo, A. (Commission of the European Communities, Luxembourg; Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1984. 148p. NTIS (US Sales Only), PC A07/MF A01. File Number DE85701491.

The code calculates the variation in space and time of all significant fuel rod variables, including fuel, gap and cladding temperature, fuel and cladding deformation, cladding oxidation and rod internal pressure. The code combines a transient 2-dimensional heat conduction code and a 1-dimensional mechanical model for the cladding deformation. The first sections of this report deal with the heat conduction model and the finite element discretization used for the thermal analysis. The mechanical deformation model is presented next: modelling of creep, phase change and oxidation of the zircaloy cladding is discussed in detail. A model describing the effect of oxidation and oxide cracking on the mechanical strength of the cladding is presented too. Next a mechanical restraint model, which allows the simulation of the presence of the neighbouring rods and is particularly important in assessing the amount of channel blockage during a transient, is presented. A description of the models used for the coolant conditions and for the power generation follows. The heat source can be placed either in the fuel or in the cladding, and direct or indirect clad heating by electrical power can be simulated. Then a section follows, dealing with the steady-state and transient types of calculation and with the automatic variable time step selection during the transient. The last sections deal with presentation of results, graphical output, test problems and an example of general application of the code.

30923 **(EUR—8920-Pt.2) RODSWELL: a computer code for the thermomechanical analysis of fuel rods under LOCA conditions. Part II: input manual.** Casadei, F.; Laval, H.; Donea, J.; Jones, P.M.; Colombo, A. (Commission of the European Communities, Luxembourg; Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1984. 54p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701492.

The present report is the user's manual for the computer code RODSWELL developed at the JRC-Ispra for the thermomechanical analysis of LWR fuel rods under simulated loss-of-coolant accident (LOCA) conditions. The code calculates the variation in space and time of all significant fuel rod variables, including fuel, gap and cladding temperature, fuel and cladding deformation, cladding oxidation and rod internal pressure. The essential characteristics of the code are briefly outlined here. The model is particularly designed to perform a full thermal and mechanical analysis in both the azimuthal and radial directions. Thus, azimuthal temperature gradients arising from pellet eccentricity, flux tilt, arbitrary distribution of heat sources in the fuel and the cladding and azimuthal variation of coolant conditions can be treated. The code combines a transient 2-dimensional heat conduction code and a 1-dimentional mechanical model for the cladding deformation. The fuel rod is divided into a number of axial sections and a detailed thermomechanical analysis is performed within each section in radial and azimuthal directions. In the following sections, instructions are given for the definition of the data files and the semi-variable dimensions. Then follows a complete description of the input data. Finally, the restart option is described.

30924 (EUR—8955) **Gas cloud explosions and their effect on nuclear power plant. Phase 1: basic development of explosion codes.** Hall, S.F.; Martin, D.; MacKenzie, J. (Commission of the European Communities, Luxembourg). 1984. 173p. NTIS (US Sales Only), PC A08/MF A01. File Number DE85701489.

The study of factors influencing the pressure and velocity fields produced by the burning of clouds of flammable substances has been in progress in SRD for some years. During this time several computer codes have been developed to aid these studies. This report concerns an extension of these studies, which involves firstly, the use of the existing codes for systematic parameter surveys and secondly, the removal of some of the limitations on the code capabilities so that they become capable of producing more realistic representations of real explosions. This work is all aimed at the study of wave and velocity fields and the influence of rigid boundaries, such as the presence of strong buildings, e.g. nuclear power plants. These existing computer models have been used to investigate the scope and range of possible pressure loadings produced by gas cloud explosions and the interaction of their pressure fields with structures. Calculations have been undertaken for a number of different fuels and at different concentrations and burning velocities. The results of some of these calculations have been used in two-dimensional wave-structure interaction calculations with structures representative of nuclear power plant buildings. Finally, the development of a two-dimensional code capable of modelling flame and pressure wave interactions with structures is presented. This code has user-oriented input and output routines with particular attention having been paid to initial conditions, obstacles and graphics. The flux corrected transport method (the state-of-the-art method for dealing with flow with shocks) is used to solve a system of equations consisting of the usual conservation equations and a simple turbulence model (two-equation K-E model) including a simple turbulence-dependent chemical reaction rate.

30925 (EUR—9043) **Computer code EURDYN-1MP (release 1) for plane fluid-structure systems: user's manual.** Giuliani, S. (Commission of the European Communities, Luxembourg; Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1984. 88p. NTIS (US Sales Only), PC A05/MF A01. File Number DE85701523.

EURDYN-1MP is a finite element computer code developed at J.R.C. Ispra to compute the response of two-dimensional, coupled fluid-structure configurations to transient dynamic loading. The structural domain is assumed to be in a situation of plane strain, but axial motion of the fluid is considered. This report gives instructions for preparing input data to EURDYN-1MP, release 1, and describes a test problem in order to illustrate both the input and the output of the code.

30926 (EUR—9101) **Influence of increasing hydrogen concentration on the heat transfer phenomena during boildown.** Shepherd, I. (Commission of the European Communities, Luxembourg). 1984. 61p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701474.

A previous paper has studied boildown transients on a single pin using a simple computer model. The computer model has now been improved to allow for the production of hydrogen by the exothermic zirconium/water reaction and this paper describes the model and studies how the previous results are changed. The same test cases were run with the new model as before; single pin boildowns at 80 bars. For the particular configuration (inlet temperature, fuel pin length, axial power distribution etc.) that was studied some conclusions were reached. Provided the cladding does not rise above melting temperature, the volume fraction of hydrogen does not rise above a value of 6%. The chief effect of the hydrogen is to reduce the thermal capacity of the coolant. Thus the clad rises to higher temperatures than would otherwise be the case. When the cladding rises above melting temperature the modelling is more approximate but there are indications that the concentration of hydrogen can rise to higher values. In these cases the oxidation reaction rate may be limited by diffusion of steam through the coolant.

30927 (EUR—9172) **Comparison of sodium aerosol codes.** Dunbar, I.H.; Fermandjian, J.; Bunz, H.; L'homme, A.; Lhiaubet, G.; Himeno, Y.; Kirby, C.R.; Mitsutsuka, N. (Commission of the European Communities, Luxembourg). 1984. 134p. NTIS (US Sales Only), PC A07/MF A01. File Number DE85701502.

Although hypothetical fast reactor accidents leading to severe core damage are very low probability events, their consequences are to be assessed. During such accidents, one can envisage the ejection of sodium, mixed with fuel and fission products, from the primary circuit into the secondary containment. Aerosols can be formed either by mechanical dispersion of the molten material or as a result of combustion of the sodium in the mixture. Therefore considerable effort has been devoted to study the different sodium aerosol phenomena. To ensure that the problems of describing the physical behaviour of sodium aerosols were adequately understood, a comparison of the codes being developed to describe their behaviour was undertaken. The comparison consists of two parts. The first is a comparative study of the computer codes used to predict aerosol behaviour during a hypothetical accident. It is a critical review of documentation available. The second part is an exercise in which code users have run their own codes with a pre-arranged input. For the critical comparative review of the computer models, documentation has been made available on the following codes: AEROSIM (UK), MAEROS (USA), HAARM-3 (USA), AEROSOLS/A2 (France), AEROSOLS/B1 (France), and PARDISEKO-IIIb (FRG).

30928 (EUR—9203) **Intercomparison test of various aerosol measurement techniques.** Cherdron, W.; Hassa, C.; Jordan, S. (Commission of the European Communities, Luxembourg). 1984. 178p. NTIS (US Sales Only), PC A09/MF A01. File Number DE85701503.

At the suggestion of the CONT group (Containment Loading and Response), which is a subgroup of the Safety Working Group of the Fast Reactor Coordinating Committee, a group of experts undertook a comparison of the techniques of sodium aerosol measurement used in various laboratories in the EC. The following laboratories took part in the exercise: CEN-Mol (Belgium), CEA-Cadarache (France), CEA-Fontenay-aux-Roses (France), KfK-Karlsruhe (Federal Republic of Germany), ENEA-Bologna (Italy), and UKAEA-Winfrith (United Kingdom). The objective of the aerosol measurement workshop was to assess the applicability and reliability of specific aerosol measuring instruments. Measurements performed with equipment from the participating laboratories were evaluated using a standard procedure. This enabled an estimate of the accuracy of the experimental data to be provided for the verification of aerosol codes. Thus these results can be used as input for the physical modelling of aerosol behaviour, and the work reported here is a contribution to the definition of the radioactive source term for severe accidents in LMFBRs. The aerosol experts participating in the exercise agreed to concentrate on the techniques of measuring aerosol particle size distributions. The tests were performed at the FAUNA test facility using the aerosol loop. A sodium spray fire, which provides a continuous aerosol source of variable concentration, was produced under open-loop conditions in this facility. Although the primary objective of the workshop was to determine the particle size distributions of the aerosols, measurements of the sodium mass concentration were also made.

30929 (IA—1404, pp 203-204) **Environmental protection as a factor in reducing the radiological effects due to an accident in a nuclear power plant.** Koch, J.; Tadmor, J. Jul 1984. NTIS (US Sales Only), PC A13/MF A01. File Number DE85780940.

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

The problems related to the calculation of the core barrel response to a pressure shock wave generated for example by a pipe rupture or a main coolant pump rotor failure are discussed. The validity of the expressions derived for numerical solutions is verified using a simple experimental setup which is also described. The validity range for the expressions is given.

30931 (IAEA-TC—427/5, pp 170-173) **Demands on small-break LOCA codes from the licensing point of view.** Hoehn, J. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

The use of approved computer codes for safety analysis is required in order to increase the confidence level in licensing statements. For this purpose the regulatory body of the GDR has embarked on a programme to authorize computer codes. The different steps will be discussed for LOCA-codes suitable for the small pipe break evaluation. In a country constructing and operating nuclear power plants on the basis of imported design documents and main components, specific aspects concerning the requirements on small-break LOCA-codes have to be taken into account. Among others, the problems connected with the modelling of the typical design features of the plant and the available computer efficiencies speak well for its own code development.

30932 (IAEA-TC—427/5, pp 39-50) **Comparisons of analysis on Rosa-III Run 912 test. A BWR small break LOCA simulation.** Tasaka, K.; Koizumi, Y.; Anoda, Y.; Kumamaru, H.; Shiba, M. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

A relatively small number of system effect experiments are available for the evaluation of BWR LOCA/EEC computer codes as compared to PWR LOCA/ECC codes. The ROSA-III programme is one of the few experimental programmes which provide the system transient data needed for such evaluation. In 1982 a standard problem was proposed by the Japanese Atomic Energy Research Institute (JAERI) to predict thermal-hydraulic transients and compare the analytical results with experimental data. Eight research groups from Japan and abroad participated in this exercise, using TRAC-BD1, RELAP4/MOD6, RELAP5/MOD5 and RELAP4/MOD6/U/J3. The paper describes the ROSA-III test facility design, the experimental procedures used and the data achieved from Run 912, and discusses the results of the analyses performed by the various participants.

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

In each transient analysis there are weaknesses, created by lack of fundamental experimental data specific to that transient, which cause uncertainties in the analytical result. Each code developer has taken a different approach to dealing with those uncertainties, including correlation to special effects tests, generally conservative modelling, and conservative overall analysis. In addition to the uncertainties associated with models, there is an interaction between the models and the nodalization selection which can significantly alter the analytical results. This paper presents an overview of selected current uncertainties as they relate to Small Break Loss of Coolant Accidents (SBLOCA), and suggests potential areas for future development and verification efforts.

30934 (IAEA-TC—427/5, pp 7-24) **Synopsis of experimental activities on small-break LOCA.** Hein, D. (Kraftwerk Union A.G., Erlangen (Germany, F.R.)). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

Through reactor safety studies like WASH 1400 or the "Deutsche Risiko-Studie" the attention has turned from large break loss of coolant accidents to small breaks because of the high contribution of this type of accidents to core meltdown. But only after the TMI-2 accident were also the main activities in the experimental fields shifted world-wide to the small break LOCAs. Since TMI numerous research programs have either been finished or are underway. This review paper presents: a classification of the various types of transients according to break size; a discussion of major physical phenomena associated with a small break LOCA, and a description of a few selected research programs and the most important results achieved.

30935 (IAEA-TC—427/5, pp 25-38) **LOBI-MOD2 small-break and special transients research.** Worth, B.; Staedtke, H.; Riebold, W.L. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

The present paper describes the LOBI-MOD2 Test Facility together with the experimental and analytical programmes. The MOD2 configuration was designed specifically to satisfy various simulation requirements originating from small break and special transients research objectives. These general objectives are identified, and the methods used to meet them are described.

30936 (IAEA-TC—427/5, pp 155-170) **RELAP5 user experiences.** Holmstroem, H. (Valtion Teknillinen Tutkimuskeskus, Helsinki (Finland)). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

Several versions of the RELAP5/MOD1 computer code have been used at VTT since January, 1981. It has proved to be a valuable tool in SBLOCA studies and analyses. However, a number of deficiencies and limitations have been detected. In this paper some comparisons between calculated and experimental data are made, deficiencies and limitations discussed and user guidelines suggested.

30937 (IAEA-TC—427/5, pp 173-185) **Computer codes development and application in NPPRI to analyse small and medium LOCA.** Misak, J.; Bazso, Z.; Klepac, J. (Vyskumny Ustav Jadrovych Elektrarni, Jaslovske Bohunice (Czechoslovakia)). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

Specific problems of small LOCA analysis are briefly discussed and basic approach used in NPPRI for this analysis is described. Three types of codes are presently used - complex primary and secondary system transient behaviour code with special attention devoted to the adequate representation of controllers, classical multinodal codes of RELAP family and special fast-running code for small LOCA analysis. Main characteristics of the codes are given and typical results of analysis are presented.

30938 (IAEA-TC—427/5, pp 192-199) **Aspects of small-break LOCA analysis using few volumes.** Eriksson, J. (Studsvik Energiteknik AB, Nykoeping (Sweden)). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

Application problems in small-break LOCA analyses may arise when the available computer has limited capacity and when the code used, in our case the RELAP5, is rather detailed. The effect on the results due to a simplified schematic nodalization - by lumping small and differently shaped volumes and heat structures - has therefore been investigated. By applying certain lumping criteria an essential reduction in the required computer time was achieved, still having satisfactory calculation results. The insensitivity of nodalization is partly a consequence of the global conservation of mass and energy.

30939 (IAEA-TC—427/5, pp 224-236) **Pre-test analysis of PMK experiments.** Perneczky, L.; Toth, I. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

The PMK test facility, currently under construction at the Hungarian Central Research Institute for Physics (CRIP) is intended to investigate the dynamic behaviour of WWER-type pressurized water reactors, in particular during a small-break LOCA. These reactors have some unique features, such as six loops in the primary circuit, horizontal steam generators, loop seals in both the hot and the cold legs, and shrouded fuel assemblies. Pre-test calculations for the first test series and their results are presented and their influence on test facility design optimization and code modelling is discussed. The calculations were made for a one percent break in the cold leg, a 3.3 percent break of the pressurizer, and steady-state natural circulation. The codes used were RELAP4/MOD3 and MOD6.

30940 (IAEA-TC—427/5, pp 255-263) **Modelling of small-break LOCA for NPP Krsko using RELAP5/MOD1 code.** Gregoric, M. (Institut Jozef Stefan, Ljubljana (Yugoslavia)). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

Experience with RELAP5/MOD1 code at Institute "Jozef Stefan" is discussed. Models of PWR Krsko are described with details on D-4 steam generator model. Integral system model was attempted and due to small progress replaced by lumped loops model, with basic hydraulic and thermal similarity to the plant and basic controls of pressurizer pressure and level. Separate models were constructed for steam generator, reactor, pressurizer and safety systems including plant control and protection systems. The problems encountered are outlined. Some results of the ongoing analysis are shown.

30941 (IAEA-TC—427/5, pp 264-270) **Fast simulation of small-break LOCA (SBLOCA) transients.** Miettinen, J. (Valtion Teknillinen Tutkimuskeskus, Helsinki (Finland)). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

The pressurized water reactors (PWR) have been designed to operate in the way that normally only liquid exists in the primary circuit. In the primary break accidents, however, the primary pressure decreases as a consequence of the coolant discharge and a two-phase condition may occur. The simulation of two-phase thermohydraulics is quite complicated and demands a lot of computer resources. Large computer code packages, like RELAP5 and TRAC are aimed for small-break LOCA (SBLOCA) simulations of reactor systems. With limited computer resources the large codes are not practical, because typically a lot of computer runs with parameter variations are needed for understanding of the two-phase transients. For extensive parameter variations a simplified two-phase model SMABRE has been developed. The basic physical models are similar to those in the large simulation codes, but by making some simplifications the fast running simulation of SBLOCA is possible. The verification of the two-phase code with plant data is not possible because the accidents leading to the two-phase condition are so rare. Instead, experimental results from small scale facilities are applied. In the case of the SMABRE verification the LOFT results were used. The applications of the code include separate plant analyses. The code has been installed as a two-phase model into the Loviisa training simulator.

30942 (IAEA-TC—427/5, pp 271-277) **Numerical simulation and analysis of the Doel-2 steam generator tube rupture.** Stubbe, E.J. (Tractionel Engineering, Brussels (Belgium)). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

A steam generator tube rupture which occurred on 2 June 1979 at the Doel-2 nuclear power plant in Belgium is analysed based on available plant recorded data and on-site computer diagnostics, with numerical simulation using the RELAP5/MOD1 computer code. The objectives were to improve understanding of the observed phenomena, to draw conclusions for procedures and system design and to assess the capabilities of the RELAP5 code. The numerical simulation of 2700 seconds of the transient is described and the conclusions drawn for the procedures and control systems are given. Also, the limitations encountered in the use of RELAP5/MOD1 are stated and solutions are presented to overcome difficulties.

30943 (IAEA-TC—427/5, pp 134-144) **Features of transients following loss-of-coolant accidents and emergency core cooling systems in pressure-tube boiling water reactors.** Volkov, V.P.; Kramerov, A.Ya.; Savvatimsky, G.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

The paper presents the characteristics of a graphite moderated pressure tube boiling water reactor (PTBWR) of the RBMK 1000 type during LOCA with large and small break sizes. It discusses related thermohydraulic phenomena investigated experimentally and analytically, refers to the effects of ECCS modifications, and outlines where additional investigations are needed.

30944 (IAEA-TC—427/5, pp 93-99) **Experimental and analytical studies pertaining to small-break LOCA in Pressurised Heavy Water Reactors.** Venkat Raj, V.; Grover, R.B.; Dolas, P.K.; Mehta, S.K. (Bhabha Atomic Research Centre, Bombay (India). Reactor Engineering Div.). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

The small-break LOCA has been a topic of worldwide discussion in the recent past. Such an accident assumes greater significance in Pressurised Heavy Water Reactors because of its higher probability. Studies are in progress pertaining to certain aspects of the blowdown and the emergency core cooling phases. These include development of instrumentation, experimental and analytical studies on blowdown, emergency coolant flow distribution and rewetting of hot horizontal channels. These are discussed in this paper.

30945 (IAEA-TC—427/5, pp 186-192) **Test models and solutions for the moderator circuit failure in PHWR Atucha I.** Goldstein, M.; Palamidessi, H.; Porto, J. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina)). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

Recurrent failures due to cracks in a moderator-circuit pipe in Atucha I Nuclear Power Station were investigated. Thermal cycling fatigue was suggested as the main cause of failure by temperature values measured on the outer wall of the pipe. Suspecting the presence of stratification between cold and hot water in a turbulent zone, a test model with a transparent acrylic pipe was devised. The presence of temperature stratification and oscillation of the interface region was clearly visible, and confirmed by temperature measurements at the inner wall of the pipe. In spite of the dissimilar values of significant parameters, between operating conditions in the station and in the test model, evidence of stratification, as being the main cause of thermal fatigue and subsequent mechanical stress, seems to be rather sound. Further studies with a simplified mathematical model worked out in a digital computer, confirmed the stratification hypothesis. Possible solutions to the practical problem are briefly discussed.

30946 (IAEA-TC—427/5, pp 277-292) **CANDU LOCA experiments comparisons with the FIREBIRD-III and RELAP5 codes.** Wright, A.C.D.; Caplan, M.Z. (Atomic Energy of Canada Ltd., Mississauga, Ontario. CANDU Operations); Proto, G.; Alemberti, A.; Bimbo, G. (Nucleare Italiana Reattori Avanzati S.p.A. (NIRA), Genoa). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

The thermohydraulics computer codes FIREBIRD-III and RELAP5 have been used to simulate a cold water injection experiment done at Westinghouse Canada Incorporated and a blowdown plus injection experiment done in the RD-12 loop at Whiteshell Nuclear Research Establishment. The cold water injection experimental facility contains two parallel horizontal CANDU-like channels, each containing a 6-m long, 37-element electrically heated bundle. RD-12 is an integrated facility containing pumps, boilers and two electrically heated test sections in a CANDU-like figure-of-eight configuration. Parametric trends have been studied by simulating several additional cold water injection experiments using FIREBIRD-III. The predictions of the two codes are compared to measurements. Overall, the predictions are reasonable, although some discrepancies occur. FIREBIRD-III predicts channel refill time well at high injection pressure; however, it underpredicts channel refill time at low injection pressure. RELAP5 predicts channel refill time well for the low pressure test. Oscillations observed during refilling are qualitatively predicted by RELAP5, although the amplitude and frequency are overpredicted.

30947 (IAEA-TC—427/5, pp 293-305) **Method for assessing reactor core cooling without forced circulation.** Midvidy, W.I.; Pauls, R.E.; Sergejewich, P. (Ontario Hydro, Nuclear Studies and Safety Dept., Toronto (Canada)). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

Under some of the postulated accidents of the CANDU PHWR, electrical power to the heat transport (HT) pumps may be interrupted resulting in the loss of forced circulation. Experiments and analyses indicate the existence of two modes of natural circulation which can provide adequate core cooling at decay power levels. These are thermosyphoning (single-phase or two-phase) and intermittent buoyancy induced flow (IBIF). A lumped parameter IBIF model, for application to heat removal below the headers, is developed and verified against pertinent experimental data. For heat transport above the headers, the various mechanisms and limiting phenomena are addressed.

30948 (IAEA-TC—427/5, pp 311-317) **Thermosyphoning in the CANDU reactor.** Spinks, N.J.; Wright, A.C.D.; Caplan, M.Z.; Prawirosoehardjo, S. (Atomic Energy of Canada Ltd., Sheridan Park, Ontario. CANDU Operations). Jul 1984. NTIS (US Sales Only), PC A14/MF A01. File Number TI. (CONF-8310369—; TC-SR—3).

From Specialists' meeting on experimental and modelling aspects of small-break LOCA; Budapest, Hungary (3 Oct 1983).

Thermosyphoning is defined as the natural convective flow of primary coolant over the boilers. It is the predicted mode of heat transport from core to boilers in many postulated scenarios for CANDU reactor safety analysis. Loss of pumping of the primary coolant is a common feature and reactor power is invariably at decay power prior to the end of pump rundown. The scenarios encompass a wide range of primary coolant inventories and secondary side conditions. CANDU primary pumps are provided with high inertia flywheels which, on loss of electrical supply, provide a forced flow of coolant whilst power is reduced to decay level. Subcooled (single-phase) thermosyphoning is predicted for this and the more probable accident scenarios. Single-phase thermosyphoning tests are done during commissioning of CANDU reactors. Recent tests at Gentilly-2 and Point Lepreau have confirmed predictions for the 600 MW(e) design. Boiling (two-phase) thermosyphoning is predicted either under reduced primary coolant inventory conditions or if the coolant make-up system is inoperative during boiler depressurization. In the latter case a pressurizer compensates, in part, for shrinkage of the primary coolant as it cools down. In any event, two-phase thermosyphoning is predicted for the less probable accident scenarios only. The paper describes the important thermohydraulic characteristics of thermosyphoning in CANDU reactors, as predicted by a transient thermohydraulics computer code, and describes experiments done for the purpose of verifying these predictions.

30949 (IKE—2-67) **Development of a mathematical model for studying rewetting of reactor fuel elements after a loss-of-coolant accident.** Schuetzle, R. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme). 15 Oct 1984. 213p. (In German). NTIS (US Sales Only), PC A10/MF A01. File Number DE85751143.

Thesis.

The ZETHYF model allows studying the flow, heat transmission and temperature conditions in a cooling channel and, thus, rewetting of reactor fuel elements. Coolant flow is calculated for a single-phase or dual-phase coolant along coolant channel on the assumption of constant pressure. Within dual-phase flow, a thermodynamically balanced slip flow is assumed for small steam volume proportions and saturation temperature is assumed for water still existing in the form of droplets. Droplet velocity is represented by means of a momentum balance between steam and droplet, evaporation of droplets is established by means of heat supply from steam, cladding tube wall and by thermal radiation. Minimum film boiling temperature is taken as a criterium for secretting and is compared with local cladding tube temperature which is established by way of a 2-D thermal conduction equation check calculation of experiments (Flecht) yielded sufficient agreement. Calculation results yielded a somewhat slower cooling of heating element and, consequently, delayed rewetting.

30950 (INFO—0089) **Comparison of deterministic and stochastic techniques for estimation of design basis floods for nuclear power plants.** Solomon, S.I.; Harvey, K.D.; Asmis, G.J.K. (Atomic Energy Control Board, Ottawa, Ontario (Canada)). Dec 1982. 21p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85701234.

The IAEA Safety Guide 50-SG-S10A recommends that design basis floods be estimated by deterministic techniques using probable maximum precipitation and a rainfall runoff model to evaluate the corresponding flood. The Guide indicates that stochastic techniques are also acceptable in which case floods of very low probability have to be estimated. The paper compares the results of applying the two techniques in two river basins at a number of locations and concludes that the uncertainty of the results of both techniques is of the same order of magnitude. However, the use of the unit hydrograph as the rainfall runoff model may lead in some cases to nonconservative estimates. A distributed non-linear rainfall runoff model leads to estimates of probable maximum flood flows which are very close to values of flows having a 10^6 - 10^7 years return interval estimated using a conservative and relatively simple stochastic technique. Recommendations on the practical application of Safety Guide 50-SG-10A are made and the extension of the stochastic technique to ungauged sites and other design parameters is discussed.

30951 **(INFO—0115) Consequences of pressure tube rupture on in-core components. Phase 1 - technology review.** Hill, P.G.; Hauptmann, E.G.; Lee, V. (Atomic Energy Control Board, Ottawa, Ontario (Canada)). Dec 1982. 186p. NTIS (US Sales Only), PC A09/MF A01. File Number DE85701246.

An investigation has been made of the consequences of pressure tube rupture in calandria vessels of heavy water cooled and moderated reactors. The study included a review of previous experimental and analytical work, as well as supplementary investigations carried out to examine the validity of previous assumptions and findings. The central questions considered were: the possibility of a propagating pressure tube failure; damage to the calandria vessel; and damage to the shut-off-rod guide tubes of the reactor shutdown system. The results of the investigation do not indicate mechanisms of sufficient strength to cause propagating failure in a well-designed, well-operated reactor following a tube burst under normal operating conditions. However, not all the details of the physical processes involved in a tube burst have been revealed by existing experimental and analytical work.

30952 (INIS-mf—9532, pp 113-114) **Isolation of small malfunctions in a PWR power plant.** Covaliu, Z. (Israel Atomic Energy Commission, Tel Aviv. Licensing Div.); Ben-Haim, Y. (Technion-Israel Inst. of Tech., Haifa. Dept. of Nuclear Engineering). 1983. NTIS (US Sales Only), PC A14/MF A01. File Number DE85780892. (CONF-831241—Summ.).

From Joint US/Israeli meeting on safety and siting problems for power reactors in a small country; Haifa, Israel (20 Dec 1983).

Published in summary form only.

30953 **(JAERI-M—83-169) Users' manual for the FTA-J (Fault Tree Analysis-JAERI) code system.** Ishigami, Tsutomu; Watanabe, Norio; Hikawa, Michihiro; Kaneki, Hiroshi; Horii, Hideo; Sasaki, Shinobu. (Japan Atomic Energy Research Inst., Tokyo). Nov 1983. 164p. (In Japanese). NTIS (US Sales Only), PC A08/MF A01. File Number DE85701120.

This report provides the information needed to use the FTA-J (Fault Tree Analysis - JAERI) code system, which is designed for systematic fault tree analysis and evaluation. Several released computer codes for the fault tree analysis have been introduced, modified and consolidated. The first version is completed and now in practical use. The code system has a data base for component failure data information and interface files between the computer codes. Using the FTA-J code system, we can perform fault tree analysis including qualitative and quantitative evaluation systematically and efficiently.

30954 **(Juel-Spez—275) Evaluation of radiation doses in the surroundings of the THTR-300 caused by a hypothetical core heat-up accident.** Fassbender, J.; Kroeger, W.; Rehm, W.; Wolters, J.; Verfondern, K.; Geiss, H. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Sicherheitsforschung). Sep 1984. 35p. (In German). NTIS (US Sales Only), PC A03/MF A01. File Number DE85751644.

As a characteristic accident sequence causing the maximum consequences, a sudden irreparable loss of core cooling at full power was assumed. This causes a slow increase in the temperature of the reactor core and the coolant gas pressure. In addition it is assumed that the gas cleaning plant fails, and that the safety valve does not shut again after it has been opened by the rising coolant gas pressure 8 hours after the initiation of the accident. This sequence of events results in a slow loss of coolant gas accompanied by an unfiltered release of radioactivity through the stack lasting about two days. The expected frequency of such an accident is less than 10^{-6}/year. When the safety valve opens, mainly noble gases and iodine will be released at first. Cesium and strontium only follow after more than 30 and 50 hours, respectively. The radiation doses were pessimistically estimated for an exposure time of 7 days. The thyroid dose nowhere exceeds 25 rem, if the consumption of contaminated food is forbidden within 8 hours after the beginning of the accident. The whole body dose is mainly caused by the inhalation of strontium. It does not exceed 5 rem and therefore does not reach the upper limit of the lowest hazard class by far. This is also true of the bone dose. The estimated doses are to be considered as a kind of upper limit values which in case of a real accident would not be reached by far. In any case the development of the accident leaves ample time for an analysis of the accident situation, the measurement of the actual radiation, and the initiation of adequate counter measures.

30955 **(KFK—3500) Nuclear Safety Project.** (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Nukleare Sicherheit). Nov 1984. 99p. (In German). NTIS (US Sales Only), PC A05/MF A01. File Number DE85751133.

The semiannual progress report 1984/1 is a description of work within the Nuclear Safety Project performed in the first six month of 1984 in the nuclear safety field by KfK institutes and departements and by external institutions on behalf of KfK. The chosen kind of this report is that of short summaries, containing the topics work performed, results obtained and plans for future work. This report was compiled by the project management.

30956 **(LA-UR—85-457) Thermal hydraulics of a feedwater pipe breakage with a back-pressure check valve.** Travis, J.R.; Torrey, M.D. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 22p. (CONF-851103—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE85007703.

From International symposium on fundamental aspects of gas-liquid flows; Miami, FL, USA (17 Nov 1985).

The SOLA-LOOP computer code for transient, nonequilibrium, two-phase flows in networks has been coupled with a dynamic check valve model. Transient back-pressure check valve behavior and fluid dynamic effects in the form of the so called waterhammer are numerically simulated for a feed-water pipe breakage accident. Three tests from the Superheated Steam Reactor Safety Program Project (PHDR) carried out near Frankfurt, West Germany are analyzed, and the calculated transient back-pressure check valve behavior and fluid dynamics effects are found to be in excellent agreement with the experimentally measured data. 5 refs., 15 figs., 4 tabs.

30957 **(LA-UR—85-558) Vital areas at nuclear power plants.** Cameron, D.F. (Los Alamos National Lab., NM (USA)). 1985. Contract W-7405-ENG-36. 14p. (CONF-850723—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85007665.

From 7. international system safety conference; San Jose, CA, USA (25 Jul 1985).

Vital area analysis of nuclear power plants has been performed for the Nuclear Regulatory Commission by the Los Alamos National Laboratory from the late 1970's through the present. The Los Alamos Vital Area Study uses a fault-tree modeling technique to identify vital areas and equipment at nuclear power plants to determine their vulnerability. This technique has been applied to all operating plants and approximately one-half of those under construction in the US. All saboteur-induced loss-of-coolant accidents and transients and the systems needed to mitigate them are considered. As a result of this effort, security programs at nuclear power plants now include vulnerability studies that identify targets in a systematic manner, and thus unnecessary protection has been minimized. 1 ref., 8 figs., 1 tab.

30958 **(LA-UR—85-1264) Faster-than-real-time simulation of nuclear reactor accidents: the TRAC-NPA code.** Woodruff, S.B. (Los Alamos National Lab., NM (USA)). Apr 1985. Contract W-7405-ENG-36. 11p. (CONF-8504123—1). NTIS, PC A02/MF A01 - GPO; GPO Dep. File Number TI85010710.

From Cray science and engineering symposium; Bloomington, MN, USA (14 Apr 1985).

A reactor safety code that provides faster-than-real-time capabilities greatly enhances the effectiveness of an analyst. We have developed a new version of the Transient Reactor Analysis Code, TRAC-NPA, which is capable of running many one- and three-dimensional transients faster than real time on current computers. TRAC is an Eulerian finite-difference code designed to model transient, two-phase, multidimensional, steam-water flow in nuclear reactors. TRAC-NPA is fast running both because it employs the efficient stability-enhancing two-step (SETS) numerical method and because much of the coding is vectorized. TRAC-NPA has been coupled to an interactive graphics executive to create a version of the Nuclear Plant Analyzer. The features of the executive include instantaneous user-friendly display of calculational results, replay, restart with parameter variation, and interactive simulation of operator actions. The graphics executive thus provides an interface that can further enhance the effectiveness of an analyst when the underlying safety code provides faster-than-real-time simulation.

30959 (LPA-P—3) Sizewell 'B' public inquiry. Proof of evidence on safety issues. Leslie, D.C. (Suffolk County Council, Ipswich (UK); Suffolk Coastal District Council, Woodbridge (UK)). Mar 1983. 184p. British Library Lending Division, Boston Spa, Wetherby, LS23 7BQ.

The report is in sections, entitled: introduction; scope of proof; the requirements of the local authorities; the roles of CEGB and NII; the Board's radiological targets; safety in normal operation; design basis faults; the analysis of faults beyond the design basis; special concerns relating to BDBFs (operator actions and responses; selected external hazards; integrity of the primary circuit; steam generator tube integrity; performance of the containment); decommissioning.

30960 (LPA-P—5) Sizewell 'B' public inquiry. Proof of evidence on assessment of the P.S.A.s made for Sizewell 'B'. Sayles, R.S. (Suffolk County Council, Ipswich (UK); Suffolk Coastal District Council, Woodbridge (UK)). Apr 1983. 55p. British Library Lending Division, Boston Spa, Wetherby, LS23 7BQ.

The report is in sections, entitled: introduction; scope of proof; method of working; the techniques of probabilistic safety analysis; the reliability data; the treatment of common cause and common mode failure; event tree analysis employing revised CMF data; the treatment of human error.

30961 (NUREG—0090-Vol.7-No.4) Report to Congress on abnormal occurrences, October-December 1984. Volume 7, No. 4. (Nuclear Regulatory Commission, Washington, DC (USA). Office for Analysis and Evaluation of Operational Data). May 1985. 36p. NTIS, PC A03/MF A01 - GPO. File Number TI85901540.

The report states that for this report period, there were two abnormal occurrences at the nuclear power plants licensed to operate. One involved four control rods failing to insert during testing and the other involved degraded upper head injection system accumulator isolation valves. There was one abnormal occurrence at a fuel cycle facility; the event involved buildup of uranium in a ventilation system. There was one abnormal occurrence reported by an Agreement State; the event involved an overexposure of a radiographer trainee. The report also contains information updating some previously reported abnormal occurrences.

30962 (NUREG—0675-Suppl.31) Safety Evaluation Report related to the operation of Diablo Canyon Nuclear Power Plant, Units 1 and 2 (Docket Nos. 50-275 and 50-323). Supplement No. 31. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). Apr 1985. 173p. NTIS, PC A08/MF A01 - GPO. File Number TI85901371.

Supplement 31 to the Safety Evaluation Report for the application by Pacific Gas and Electric Company for a license to operate Diablo Canyon Nuclear Power Plant Unit 2 (Docket 50-323) has been prepared by the Office of Nuclear Reactor Regulation of the US Nuclear Regulatory Commission. This supplement addresses a number of matters related to the issuance of an operating license for Diablo Canyon Unit 2, in particular issues identified by the NRC staff in earlier supplements, commitments made by the applicant and certain license conditions to be included in the Unit 2 operating license.

30963 (NUREG—0797-Suppl.10) Safety Evaluation Report related to the operation of Comanche Peak Steam Electric Station, Units 1 and 2 (Docket Nos. 50-445 and 50-446). Supplement No. 10. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). Apr 1985. 329p. NTIS, PC A15/MF A01 - GPO. File Number TI85900972.

This Supplement provides the results of the staff's evaluation and resolution of approximately 400 technical concerns and allegations in the mechanical and piping area regarding construction practices at the Comanche Peak facility. This report does not address the Walsh/Doyle allegations regarding deficiencies in the pipe support design process and the new allegations recently received by the staff.

30964 (NUREG—0797-Suppl.11) Safety Evaluation Report related to the operation of Comanche Peak Steam Electric Station, Units 1 and 2 (Docket Nos. 50-445 and 50-446). Supplement No. 11. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). May 1985. 347p. NTIS, PC A15/MF A01 - GPO. File Number TI85901541.

Supplement 11 to the Safety Evaluation Report for the Texas Utilities Electric Company application for a license to operate Comanche Peak Steam Electric Station, Units 1 and 2 (Docket Nos. 50-445, 50-446), located in Somervell County, Texas, has been jointly prepared by the Office of Nuclear Reactor Regulation and the Comanche Peak Technical Review Team (TRT) of the US Nuclear Regulatory Commission (NRC) and is in two parts. Part 1 (Appendix 0) of this supplement provides the results of the TRT's evaluation of approximately 124 concerns and allegations relating specifically to quality assurance and quality control (QA/QC) issues regarding construction proctices at the Comanche Peak facility. Part 2 (Appendix P) contains an overall summary and conclusion of the QA/QC aspects of the NRC Technical Review Team efforts as reported in supplemental Safety Evaluation Report SERs 7, 8, 9, and 10. Since QA/QC issues are also contained in each of the other supplements, the TRT considered that such a summary and conclusion from all supplements was necessary for a complete TRT description of QA/QC activities at Comanche Peak.

30965 (NUREG—0857-Suppl.8) Safety Evaluation Report related to the operation of Palo Verde Nuclear Generating Station, Units 1, 2, and 3 (Docket Nos. STN 50-528, STN 50-529, and STN 50-530). Supplement No. 8. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). May 1985. 35p. NTIS, PC A03/MF A01 - GPO. File Number TI85901545.

Purpose of this supplement is to update the Safety Evaluation Report by providing an evaluation of additional information submitted by the applicant since Supplement No. 7 was issued and matters that the staff had under review when Supplement No. 7 was issued, specifically those issues which required resolution prior to plant operation of Unit 1 above 5% full power.

30966 (NUREG—0991-Suppl.4) Safety Evaluation Report related to the operation of Limerick Generating Station, Units 1 and 2 (Docket Nos. 50-352 and 50-353). Supplement No. 4. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). May 1985. 48p. NTIS, PC A03/MF A01 - GPO. File Number TI85901359.

In August 1983 the staff of the Nuclear Regulatory Commission issued its Safety Evaluation Report (NUREG-0991) regarding the application of the Philadelphia Electric Company (the applicant) for licenses to operate the Limerick Generating Station, Units 1 and 2 located on a site in Montgomery and Chester Counties, Pennsylvania. A license (NPF-27) for the operation of Limerick Unit 1 was issued on October 26, 1984. The license, which was restricted to a five percent power level, contained conditions which required resolution prior to proceeding beyond the five percent power level. This Supplement 4 to the SER addresses some of those technical issues and their associated license conditions which require resolution prior to proceeding beyond the five percent power level. The remaining issues to be addressed prior to proceeding beyond the five percent power level will be addressed in a later supplement to this report. This Supplement 4 to the SER also contains the comments made by the Advisory Committee on Reactor Safeguards in its report dated November 6, 1984, regarding full power operation of Limerick Unit 1.

30967 **(NUREG—1032) Evaluation of Station Blackout accidents at nuclear power plants. Technical findings related to Unresolved Safety Issue A-44. Draft report for comment.** Baranowsky, P.W. (Nuclear Regulatory Commission, Washington, DC (USA)). May 1985. 198p. NTIS, PC A09/MF A01 - GPO. File Number TI85901551.

"Station Blackout," which is the complete loss of alternating current (ac) electrical power in a nuclear power plant, has been designated as Unresolved Safety Issue A-44. Because many safety systems required for reactor core decay heat removal and containment heat removal depend on ac power, the consequences of a station blackout could be severe. This report documents the findings of technical studies performed as part of the program to resolve this issue. The important factors analyzed include: the frequency of loss of offsite power; the probability that emergency or onsite ac power supplies would be unavailable; the capability and reliability of decay heat removal systems independent of ac power; and the likelihood that offsite power would be restored before systems that cannot operate for extended periods without ac power fail, thus resulting in core damage. This report also addresses effects of different designs, locations, and operational features on the estimated frequency of core damage resulting from station blackout events.

30968 **(NUREG—1037) Containment performance working group report. Draft report for comment.** (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering). May 1985. 317p. NTIS, PC A14/MF A01 - GPO. File Number TI85900970.

Containment buildings for power reactors have been studied to estimate their leak rate as a function of increasing internal pressure and temperature associated with severe accident sequences involving significant core damage. Potential leak paths through containment penetration assemblies (such as equipment hatches, airlocks, purge and vent valves, and electrical penetrations) have been identified and their contributions to leak area for the containment are incorporated into containment response analyses of selected severe accident sequences to predict the containment leak rate and pressure/temperature response as a function of time. Because of lack of reliable experimental data on the leakage behavior of containment penetrations and isolation barriers at pressures beyond their design conditions, an analytical approach has been used to estimate the leakage behavior of components found in specific reference plants that approximately characterize the various containment types.

30969 **(NUREG—1038-Suppl.2) Safety Evaluation Report related to the operation of Shearon Harris Nuclear Power Plant, Unit No. 1 (Docket No. STN 50-400). Supplement No. 2.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). Jun 1985. 62p. NTIS, PC A04/MF A01 - GPO. File Number TI85901567.

This report, Supplement No. 2 to the Safety Evaluation Report for the application filed by the Carolina Power and Light Company and North Carolina Eastern Municipal Power Agency (the applicants) for a license to operate the Shearon Harris Nuclear Power Plant Unit 1 (Docket No. 50-400), has been prepared by the Office of Nuclear Reactor Regulation of the US Nuclear Regulatory Commission. This supplement reports the status of certain items that had not been resolved at the time of publication of the Safety Evaluation Report and Supplement No. 1.

30970 **(NUREG—1095) Evaluation of responses to IE Bulletin 82-02: degradation of threaded fasteners in reactor coolant pressure boundary of pressurized-water-reactor plants.** Anderson, W.; Sterner, P. (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Emergency Preparedness and Engineering Response). May 1985. 89p. NTIS, PC A05/MF A01 - GPO. File Number TI85901547.

IE Bulletin 82-02 was issued by the NRC on June 2, 1982, to notify licensees about incidents of severe degradation of threaded fasteners. The bulletin required appropriate action including submittal of information from pressurized water reactors having an operating license. Responses from 41 licensees included their recent experience with degradation of threaded fasteners in primary system components. Data from recent regular inspections of reactor coolant pressure boundary component connections of 6-in. size and larger are compiled for technical evaluation. Statistical analysis is used to determine significant factors related to frequency of leakage incidents in connections, occurrence of degradation of bolts and studs, and the need for bolt replacement. Factors examined include the age of the plant, types of components, use of lubricants and sealants, and differences between plants. The compiled data indicate that, on the average, 10% of the bolted connections show evidence of leaking during an 18-month period. Also, 80% of the connections that show evidence of leakage undergo some degradation of the bolting. Results of the analysis show a significant decrease in the occurrence of bolting degradation events as the age of the plant increases. The data also show that valves are less subject to bolting corrosion. A group of 5 of the 41 plants accounted for about one-half of the reported leakage and corrosion events. The common characteristic found for four of these five plants was the lubricant used. The use of nickel-graphite based lubricants appears to offer a significantly reduced incidence of leakage and corrosion, based on late corrections to the reported data. The data also permit the conclusion that the use of molybdenum-disulfide-based lubricants and graphite-based lubricants results in a significantly increased incidence of leakage and corrosion. Reporting of data on lubricants was of poor quality and detracted from the value of the bulletin responses.

30971 **(NUREG—1119) Safety Evaluation Report related to renewal of the operating license for the CAVALIER Training Reactor at the University of Virginia (Docket No. 50-396).** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). May 1985. 62p. NTIS, PC A04/MF A01 - GPO. File Number TI85901502.

This Safety Evaluation Report for the application filed by the University of Virginia for a renewal of Operating License R-123 to continue to operate the CAVALIER (Cooperatively Assembled Virginia Low Intensity Educational Reactor) has been prepared by the Office of Nuclear Reactor Regulation of the US Nuclear Regulatory Commission. The facility is owned and operated by the University of Virginia and is located on the campus in Charlottesville, Virginia. Based on its technical review, the staff concludes that the reactor facility can continue to be operated by the university without endangering the health and safety of the public or the environment.

30972 **(NUREG—1135) Safety Evaluation Report related to the construction permit and operating license for the research reactor at the University of Texas (Docket No. 50-602).** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). May 1985. 86p. NTIS, PC A05/MF A01 - GPO. File Number TI85901542.

This Safety Evaluation Report for the application filed by the University of Texas for a construction permit and operating license to construct and operate a TRIGA research reactor has been prepared by the Office of Nuclear Reactor Regulation of the US Nuclear Regulatory Commission. The facility is owned and operated by the University of Texas and is located at the university's Balcones Research Center, about 7 miles (11.6 km) north of the main campus in Austin, Texas. The staff concludes that the TRIGA reactor facility can be constructed and operated by the University of Texas without endangering the health and safety of the public.

30973 (NUREG/CP—0058-Vol.2, pp 5-15) **TRAC-PF1 analyses of potential pressurized-thermal-shock transients at a Combustion-Engineering PWR.** Koenig, J.E.; Smith, R.C. (Los Alamos National Lab., NM). Jan 1985. NTIS, PC A20/MF A01 - GPO $9.00. File Number TI85900642. (CONF-8410142—Vol.2).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

Los Alamos National Laboratory participated in a program to assess the risk of a pressurized thermal shock (PTS) to the reactor vessel during a postulated overcooling transient in a pressurized water reactor (PWR). Using the Transient Reactor Analysis Code (TRAC), Los Alamos studied the thermal-hydraulic behavior of the three following accident categories: steamline breaks, runaway-feedwater transients, and small-break loss-of-coolant accidents. These accidents were simulated for a Combustion-Engineering (C-E) PWR, Calvert Cliffs, and included multiple operator and equipment failures. The results will be used by Oak Ridge National Laboratory (ORNL) to determine the vessel wall temperature and pressure predicted by TRAC. The study identified the importance of the initial plant conditions and loop flows to the PTS issue. ORNL will extend the results of the Los Alamos study by determining the probability of vessel failure and accident occurrence for an overall assessment of PTS risk.

30974 (NUREG/CP—0058-Vol.2, pp 55-76) **Buoyancy effects in overcooling transients.** Theofanous, T.G.; Iyer, K. (Purdue Univ., Lafayette, IN). Jan 1985. NTIS, PC A20/MF A01 - GPO $9.00. File Number TI85900642. (CONF-8410142—Vol.2).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

This presentation is a short report on Purdue University's contribution to the NRC pressurized thermal shock (PTS) study. Our task was to include stratification/thermal-mixing effects in the thermal-hydraulic scenarios developed by TRAC and RELAP5 calculations. The results from our study provided the input to the fracture mechanics calculations carried out at ORNL. A method was previously presented for predicting the onset of stratification in the cold leg due to HPI. Use of these criteria with the thermal-hydraulic behavior predicted by TRAC and RELAP5 leads to the conclusion that the only practically significant situation where stratification need to be considered is that involving loop flow stagnation. Of principal interest are, therefore, transients leading to complete flow stagnation. The Calvert Cliffs analyses by TRAC have also shown that an asymmetric downcomer condition, obtained by flow stagnation in only one or two of the loops, is also possible. It has been demonstrated that the basic analyses tools developed for the fully stagnated case can be fruitfully employed to address the asymmetric situations also. The analysis was based on the regional mixing model (RMM) and the associated computer code REMIX. These analytical tools were supported by reactor-specific simulations in Purdue's one-half scale PTS facility.

30975 (NUREG/CP—0058-Vol.2, pp 77-88) **Integrated pressurized thermal shock (IPTS) program probabilistic fracture-mechanics analysis and results.** Cheverton, R.D.; Ball, D.G. (Oak Ridge National Lab., TN). Jan 1985. NTIS, PC A20/MF A01 - GPO $9.00. File Number TI85900642. (CONF-8410142—Vol.2). Contract AC05-84OR21400.

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

The pressurized-thermal-shock (PTS) issue is concerned with the possibility of failure of a PWR pressure vessel during a transient that subjects the vessel to severe thermal shock. The ingredients necessary for failure to occur are (1) the occurrence of the transient, (2) the presence of a sharp, cracklike defect (flaw) on the inner surface, (3) exposure of the vessel wall to high fast-neutron fluxes, and (4) high concentrations of copper and nickel. The overall estimated frequency of vessel failure is determined by postulating appropriate transients, estimating their frequency of occurrence, and calculating the probability, P(F/E), of vessel failure for each of these transients. The probabilistic fracture-mechanics (PFM) model used for estimating P(F/E) and the scope and results of the fracture-mechanics studies for the Integrated Pressurized Thermal-Shock (IPTS) Program are the subject of this paper. The scope of the PFM studies includes estimates of (1) P(F/E) for reactor pressure vessels similar to those at Oconee-I, Calvert Cliffs-1, and H. B. Robinson-2, using PTS transients postulated for these plants; (2) the effect of including warm prestressing (WPS) in the calculation of P(F/E); (3) the sensitivity of P(F/E) to fracture toughness, radiation damage, and the primary-system temperature and pressure transients; and (4) the benefit of specific suggested remedial measures (reduction in fluence rate, application of in-service inspection, limit on repressurization, and annealing).

30976 (NUREG/CP—0058-Vol.2, pp 136-147) **Consequence evaluation for pressurized thermal shock.** Barrett, R.J.; Throm, E.D. (Nuclear Regulatory Commission, Washington, DC). Jan 1985. NTIS, PC A20/MF A01 - GPO $9.00. File Number TI85900642. (CONF-8410142—Vol.2).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

The purpose of this paper is to illustrate the logic and methods required to estimate the societal consequences of a large break LOCA resulting from pressurized thermal shock (PTS). The analysis includes an assessment of containment response, radionuclide behavior and offsite consequences. The intent is to demonstrate the type of analysis that might be performed for a plant that is approaching the PTS screening criterion. Much of the data and many of the assumptions used in the analysis are based on experience with previous risk studies. Hence, the results are approximate. The containment and site characteristics are intended to model Oconee Unit 1, a plant for which the frequency and phenomenology of PTS events have been studied in some detail. For the purpose of this paper, it has been assumed that events lead to core melt. Given a core melt, the estimation of risk involves several major steps. First one must define the plant damage state, which describes the status of the primary system and major safety systems. Based on the plant damage states one can deduce the containment response and the magnitude of the radiological releases. Finally, using the calculated releases, the offsite consequences are estimated.

30977 (NUREG/CP—0058-Vol.2, pp 266-305) **Investigation of dispersed flow heat transfer phenomena and assessment of TRAC-PF1/MOD1 heat transfer correlations.** Vojtek, I. (Gesellschaft fuer Reaktorsicherheit mbH, Garching, West Germany). Jan 1985. NTIS, PC A20/MF A01 - GPO $9.00. File Number TI85900642. (CONF-8410142—Vol.2).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

The objectives of this research effort are two-fold: 1) Assessment and improvement of existing TRAC-PF1/MOD heat transfer model. The first part of this investigation has been performed using a Driver computer code. The driver program BOILTRC consists of all TRAC-PF1/MOD1 heat transfer and properties routines and calculates heat transfer coefficients in all TRAC heat transfer regimes as a function of independent variables. The next part of the assessment that was focused mainly at the post-CHF heat transfer regime has been performed using TRAC PF1/MOD1 computer code for the post-test analysis of simple separate effects heat transfer experiments. 2) Evaluation of alternative post-CHF heat transfer models. Three different post-CHF heat transfer models were implemented into the TRAC PF1/MOD1 and have been applied for the calculation of wall-mixture heat transfer components.

30978 (NUREG/CP—0058-Vol.2, pp 306-341) **Results of CCTF upper plenum injection tests.** Murao, Y.; Iguchi, T.; Okabe, K.; Sugimoto, J.; Akimoto, H.; Okubo, T. (Japan Atomic Energy Research Institute, Tokyo). Jan 1985. NTIS, PC A20/MF A01 - GPO $9.00. File Number TI85900642. (CONF-8410142—Vol.2).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

By using the Cylindrical Core Test Facility (CCTF), many tests have been performed in Japan Atomic Energy Research Institute (JAERI) in order to investigate the thermo-hydrodynamic phenomena in the refill and reflood phase during a PWR-LOCA. Most of tests have been conducted by using cold leg injection (CLI) type ECCS for three- or four-loop PWRs. Some two-loop PWRs, however, equip the upper plenum injection (UPI) type ECCS instead of CLI type ECCS. The following two possibilities are considered in the UPI type ECCS. (1) The larger steam binding and the resultant poorer core cooling appears than those in referential CLI type ECCS. (2) The higher upper plenum injection rate causes the poorer core cooling in the UPI type ECCS. In order to investigate the possibilities, two UPI tests were performed. One was a test under no failure assumption of two low pressure coolant injection pumps, and the other was a test under a single failure assumption. The results from two UPI tests and a referential single failure CLI test are compared and analyzed.

30979 (NUREG/CP—0058-Vol.2, pp 342-372) **Status of CCTF/SCTF test programs.** Murao, Y.; Adachi, H.; Iguchi, T.; Sobajima, M.; Okabe, K.; Sugimoto, J.; Akimoto, H.; Iwamura, T.; Okubo, T.; Abe, Y. (Japan Atomic Energy Research Institute, Tokyo). Jan 1985. NTIS, PC A20/MF A01 - GPO $9.00. File Number TI85900642. (CONF-8410142—Vol.2).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

The Cylindrical Core Test Facility (CCTF) and the Slab Core Test Facility (SCTF) are the facilities of the Large Scale Reflood Test Program which was initiated in April, 1976. This program has been built in the 2D/3D project which is performed by USNRC, BMFT and JAERI. The CCTF is designed to model a four-loop 1000MWe PWR with the flow area scaling ratio of 1/21.44 and has a scaled pressure vessel with a full length core and four loops with passive and active components. Using CCTF, the core thermo-hydrodynamic behavior coupled with the system behavior in the primary loops has been investigated for the refill and reflood phases of a PWR-LOCA. The SCTF is being operated to complement the results from CCTF specially in the field of the multi-dimensional thermo-hydrodynamic behavior in a radially wide core and upper plenum. The SCTF has a full length, full radius and one-bundle depth PWR simulated core which is composed of in-line eight bundles, and has downcomer, upper plenum, lower plenum and simplified loop with passive components. In this presentation, the following topics are explained: 1) CCTF best estimate (BE) test; 2) CCTF refill test; 3) CCTF multi-dimensional test; 4) SCTF multi-dimensional test; and 5) related code development.

30980 (NUREG/CP—0058-Vol.2, pp 373-394) **TRAC analyses for CCTF and SCTF tests and UPTF design/operation.** Motley, F.E. (Los Alamos National Lab., NM). Jan 1985. NTIS, PC A20/MF A01 - GPO $9.00. File Number TI85900642. (CONF-8410142—Vol.2).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

The 2D/3D Program is a multinational (Germany, Japan, and the US) experimental and analytical nuclear reactor safety research program. Its main purpose is the investigation of multidimensional thermal-hydraulic behavior in large-scale experimental test facilities having hardware prototypical of pressurized water reactors (PWRs). The Japanese are presently operating two large-scale test facilities as part of this program: the Cylindrical Core Test Facility (CCTF) and the Slab Core Test Facility (SCTF). The German contribution to the program is the Upper Plenum Test Facility (UPTF), a full-scale facility with vessel, four loops, and a steam-water core simulator under construction in Mannheim, Germany. The US contributions to the program are the provision of advanced two-phase flow instrumentation and analytical support. The Los Alamos National Laboratory is the prime contractor to the US NRC in the latter activity. The main analytical tool in this program is in the Transient Reactor Analysis Code (TRAC), a best-estimate, multidimensional, nonequilibrium, thermal-hydraulics computer code developed for the US NRC at Los Alamos. Through code predictions of experimental results and calculations of PWR transients, TRAC provides the analytical coupling between the facilities and extends the results to predicting actual PWR behavior. Activities during fiscal 1984 are discussed.

30981 (NUREG/CP—0058-Vol.2, pp 395-408) **Safety analysis code input automation using the Nuclear Plant Data Bank.** Kopp, H.; Leung, J.; Tajbakhsh, A.; Viles, F. Jan 1985. NTIS, PC A20/MF A01 - GPO $9.00. File Number TI85900642. (CONF-8410142—Vol.2).

The Nuclear Plant Data Bank (NPDB) is a computer-based system that organizes a nuclear power plant's technical data, providing mechanisms for data storage, retrieval, and computer-aided engineering analysis. It has the specific objective to describe thermohydraulic systems in order to support: rapid information retrieval and display, and thermohydraulic analysis modeling. The Nuclear Plant Data Bank (NPBD) system fully automates the storage and analysis based on this data. The system combines the benefits of a structured data base system and computer-aided modeling with links to large scale codes for engineering analysis. Emphasis on a friendly and very graphically oriented user interface facilitates both initial use and longer term efficiency. Specific features are: organization and storage of thermohydraulic data items, ease in locating specific data items, graphical and tabular display capabilities, interactive model construction, organization and display of model input parameters, input deck construction for TRAC and RELAP analysis programs, and traceability of plant data, user model assumptions, and codes used in the input deck construction process. The major accomplishments of this past year were the development of a RELAP model generation capability and the development of a CRAY version of the code.

30982 (NUREG/CP—0058-Vol.3, pp 19-39) **Analysis of small-small-break LOCA sequences in the Oconee-1 power plant.** Dearing, J.F. (Los Alamos National Lab., NM). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

This paper presents an analysis of a particular accident sequence in the Oconee-1 power plant. The initiator for this sequence is a random break of less than 102-mm (4-in.) diameter in the primary-system cold-leg piping. During the course of the accident, the high-pressure recirculation system is assumed to not be functional and the steam generators to remain isolated. The supply of once-through borated water will allow the high pressure injection system (HPIS) system to function while the operator attempts to either restore high-pressure recirculation or bring the primary to conditions under which the low-pressure recirculation system is functional. The response of the primary system is strongly determined by both break size and HPIS flow. For small breaks it may be necessary to limit the amount of HPIS flow to depressurize the primary. This strategy will extend the life of the once-through cooling water, but will also decrease the cooling rate of the primary system. Calculations were performed to indicate the effect of varying break size and operator throttling of the HPIS on several important factors that will help determine the outcome of the accident. These include 1) effectiveness of the HPIS in keeping the primary full, 2) ability to reach conditions of low-pressure recirculation, and 3) time duration that once-through cooling water remains available. The analysis was performed using TRAC/PF1.

30983 (NUREG/CP—0058-Vol.3, pp 40-46) **Integrated TRAC/MIMAS analysis of core damage from a TMLB′ sequence in Oconee-1.** Henninger, R.J.; Smith, R.C.; Boyack, B.E. (Los Alamos National Lab., NM). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

Realistic estimates of radioactive releases in the event of a severe accident require the use of a mechanistic calculational tool that models the entire primary system of a pressurized water reactor (PWR). This tool must begin with an accident initiator and determine the entire accident sequence up to failure of and release of radioactivity from the primary system. The TRAC/MELPROG code under joint development by Sandia and Los Alamos National Laboratories will provide such a capability. The models in the TRAC/MELPROG code will be sufficiently detailed to provide insights into the effects of all the important phenomena occurring in a degraded-core accident including multi-dimensional flow within the reactor vessel. An important step in the development of TRAC/MELPROG is TRAC/MIMAS. Although it is limited by one-dimensional fluids modeling, lack of a debris bed model and one-dimensional modeling of important vessel structures, TRAC/MIMAS provides useful information about a degraded-core accident up to debris bed formation. In this presentation, the authors analyze a sample calculation of a loss of feedwater with failure of the emergency core cooling system (TMLB′) sequence for Oconee-1.

30984 (NUREG/CP—0058-Vol.3, pp 109-121) **Chemical factors affecting fission product transport in BWR severe accidents.** Beahm, E.C.; Wichner, R.P.; Weber, C.F. (Oak Ridge National Lab., TN). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

Chemical changes may significantly alter physical properties of fission product materials, and hence their state and transport rate. Thus, it is possible that an appropriate accounting of chemical change could have a large impact on transport model results. This paper will describe how the chemical reactions of Cs, I, and Te are being implemented in the transport model that is used in the Severe Accident Sequence Analysis (SASA) Program at Oak Ridge National Laboratory (ORNL).

30985 (NUREG/CP—0058-Vol.3, pp 122-135) **Fission product transport analysis in a loss of decay heat removal accident at Browns Ferry.** Wichner, R.P.; Weber, C.F.; Hodge, S.A. (Oak Ridge National Lab., TN). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

This paper summarizes an analysis of the movement of noble gases, iodine, and cesium fission products within the Mark-I containment BWR reactor system represented by Browns Ferry Unit 1 during a postulated accident sequence initiated by a loss of decay heat removal (DHR) capability following a scram. The event analysis showed that this accident could be brought under control by various means, but the sequence with no operator action ultimately leads to containment (drywell) failure followed by loss of water from the reactor vessel, core degradation due to overheating, and reactor vessel failure with attendant movement of core debris onto the drywell floor. The analysis of fission product transport presented in this paper is based on the no-operator-action sequence and provides an estimate of fission product inventories as a function of time within 17 control volumes outside the core, with the atmosphere considered as the final control volume in the transport sequence. The paper includes discussion of fission product transport calculation features, control volumes, loss of decay heat removal accident sequence, and results, i.e., predicted radioactive inventories in major reactor zones.

30986 (NUREG/CP—0058-Vol.3, pp 217-233) **Preliminary results of the KFK molten core/concrete experimental β facility.** Alsmeyer, H.; Reimann, M.; Hosemann, J.P. (Kernforschungszentrum Karlsruhe, West Germany). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

The investigations discussed in this paper are part of the core meltdown accident research in the Federal Republic of Germany (FRG) which concentrates on risk assessment and is not regarded as a basis for licensing procedures. First, a brief summary of the FRG view on severe pressurized water reactor accidents is given. The special objectives of the melt/concrete investigations in light of source term evaluation, a description of the β test facility, experimental results, and a comparison of the results with the WECHSL code are discussed, and conclusions are presented.

30987 (NUREG/CP—0058-Vol.3, pp 290-301) **Mechanisms in dryout of debris beds.** Theofanous, T.G.; Hu, K. (Purdue Univ., Lafayette, IN). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

Experimental results from Purdue's Large Scale Debris Bed Coolability Facility have identified an important aspect of the dryout behavior that not only provides definitive direction concerning the controlling mechanism but have also provided the means for precise definition and measurement of Dryout Inception Power (DIP). The first data on transient development of dryout for powers exceeding the DIP are also presented. By taking into account the power-to-dryout time delay an unambiguous definition of dryout inception was developed which together with a well instrumented bed provided highly reproducible dryout inception data. These data are unique in bed dimensions (near full scale) and particulate characteristics (non-spherical particles). Based on the data, the Theofanous-Saito correlation is recommended for use in LWR severe accident assessments.

30988 (NUREG/CP—0058-Vol.3, pp 323-337) **Steam explosion studies at Winfrith.** Briggs, A.J. (United Kingdom Atomic Energy Authority, Winfrith, England). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

Studies of molten fuel-coolant interaction, (MFCI), were started at the Winfrith establishment of the UKAEA in 1975 and have continued since that time. Early in the program the main interest was in fast reactor applications, but more recently much of the work has been concerned with PWR applications, because of the proposal to build a PWR in the UK at Sizewell. This program has concentrated on experimental work which has had three overlapping stages. Stage 1 used simulant materials to observe the characteristics of an explosion in a system large enough for propagation to be important. Stage 2 used thermite-generated molten UO_2 to study the interaction of small masses of higher temperature melt with water and sodium. Stage 3 is investigating the interaction of larger masses of high temperature melt in situations more closely related to reactor accident conditions. Stage 3 of the program is discussed in the paper. Within the overall aim of improving understanding of MFCI phenomena three topics are included in the Winfrith program which particularly relate to the uncertainty of a large in-vessel steam explosion leading to early containment failure: 1) scaling; 2) mixing limitations; and 3) trigger phenomena. These topics and some basic studies being conducted are discussed.

30989 (NUREG/CP—0058-Vol.3, pp 401-422) **BNL severe accident sequence experiments and analysis program.** Greene, G.A.; Ginsberg, T.; Tutu, N.K. (Brookhaven National Lab., Upton, NY). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

Analyses of LWR degraded core accidents require mathematical characterization of two major sources of pressure and temperature loading on the reactor containment buildings: (1) steam generation from core debris-water thermal interactions and (2) molten core-concrete interactions. Experiments are in progress at BNL in support of analytical model development related to aspects of the above containment loading mechanisms. The work supports development and evaluation of the CORCON, MARCH, CONTAIN and MEDICI computer under development at other NRC-contractor laboratories. The thermal-hydraulic behavior of hot debris located within the reactor core region upon sudden introduction of cooling water is being investigated in a joint experimental and analytical program. This work supports development and evaluation of the SCDAP computer code being developed at EG and G to characterize in-vessel severe core damage accident sequences. Progress is described in the two areas of: 1) core debris thermal-hydraulic phenomenology and 2) heat transfer in core-concrete interactions.

30990 (NUREG/CP—0058-Vol.3, pp 445-459) **COBRA-NC application to containment analysis.** Wheeler, C.L.; Thurgood, M.J. (Battelle, Pacific Northwest Lab., Richland, WA). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

The COBRA-NC (Nuclear Containment) computer code has been developed for the US NRC at the Battelle-operated Pacific Northwest Laboratory to analyze thermal-hydraulic transients in light water reactor containment buildings. It is designed to predict room pressurization, pressure differentials between rooms, jet impingement forces, and asymmetric loads during a loss-of-coolant accident. It is also designed to predict the distribution of hydrogen and noncondensable gases within the containment building, both during and following a loss-of-coolant accident where hydrogen may be generated by metal-water reactions or by radiolysis. Code improvements and applications are discussed in this paper.

30991 (NUREG/CP—0058-Vol.3, pp 460-480) **Statistical evaluation of the heat transfer data obtained in the HDR containment tests.** Almenas, K.; Lee, U.C. (Univ. of Maryland, College Park). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

The containment tests conducted at the HDR facility have greatly expanded the experimental data base for energy transfer in large, complex geometry volumes. This data has been made available in a sequence of experimental reports, and its affect on heat-transfer modeling has been analyzed in several studies. Two categories of energy transfer data are provided by the experiments: 1) Integral energy transfer rate, either overall or compartment dependent, has to be inferred from appropriate energy balances utilizing experimental pressure, temperature and blow down rate measurements; 2) Local energy transfer rate is measured directly at up to 12 locations within the containment. The HDR heat-transfer measurements have become the fundamental data-base for benchmarking containment heat transfer modeling. The approaches taken in the modeling are discussed in detail.

30992 (NUREG/CP—0058-Vol.3, pp 512-535) **FRAPCON-2 assessment: power reactor fuel performance data and code evaluation status.** Coleman, D.R. Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

The Nuclear Regulatory Commission's Division of Accident Evaluation (DAE) is sponsoring a fuel behavior research program entitled "Evaluation of Power Reactor Fuel Performance Analysis Capabilities". The main program objective is to evaluate the performance and accuracy of DAE-sponsored fuel rod material behavior codes for application to commercial fuel design and operational conditions. Program emphasis to data has been on the steady state fuel rod model, FRAPCON-2. During each of 2 FRAPCON activity phases, available high burnup results from EPRI and DOE sponsored power reactor fuel surveillance programs have been acquired, reviewed, and analyzed to provide the basic code input and fuel performance data. This data is then applied to the generation of FRAPCON predictions, the systematic comparison of key predicted and measured fuel performance parameters, and the interpretation of results to identify code capabilities and outstanding model development requirements. The program activities are documented in the form of Data and Code Evaluation Reports.

30993 (NUREG/CP—0058-Vol.3, pp 536-556) **Degraded core analysis.** Gittus, J.H. (United Kingdom Atomic Energy Authority). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

An analysis of the likelihood and the consequences of degraded core accidents has been undertaken for the proposed Sizewell B PWR, by the UK Atomic Energy Authority, the Industry, and the National Radiological Protection Board. This analysis, results of which are summarized in the present paper, discloses an encouraging situation revealing that the risks posed by the plant to the public have been held to very low levels.

30994 (NUREG/CP—0058-Vol.3, pp 557-566) **EPRI core materials program.** Franklin, D.; Gehl, S.; Machiels, A.; Santucci, J. (Electric Power Research Institute, Palo Alto, CA). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

The EPRI Core Materials program investigates the behavior of materials whose properties are significantly influenced by the irradiation field of the core. The components of current primary interest are fuel rods and assemblies, control materials, BWR stainless steel structural core components, and BWR fuel channels. The primary emphasis is on reliability. The secondary emphasis is on extending the service life of periodically replaced components. The following discussion is limited to research on fuel performance. The primary issues are fuel reliability, waterside corrosion, Zircaloy hydriding and corrosion, fission-product release, and deformation. The paper begins with a presentation of the EPRI goals. This is followed by a discussion of the primary technical issues associated with fuel performance and the improved designs being pursued.

30995 (NUREG/CP—0058-Vol.3, pp 567-573) **US Department of Energy extended burnup program.** Lang, P.M. (Dept. of Energy, Washington, DC). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

For several years the Department of Energy and other organizations have been supporting projects to extend the burnup of nuclear fuel in light water reactors. This paper reviews the Department's research and development projects under which a large number of test assemblies are being irradiated in power reactors and under which experiments and studies on individual technical issues, such as fission-gas release, are being conducted. The principal motivations for extended burnup are improved fuel performance and economics and reduced spent fuel generation, rather than safety. Nevertheless, safety related work has been included as an integral part of extended burnup development, since licensing of burnup extension is a necessary part of its implementation. In addition, burnup extension yields safety and environmental advantages: improved fuel integrity, reduced occupational radiation exposures, reduced fast neutron flux to the reactor vessel, and reduced generation of the spent fuel waste. This paper reviews the status of extended burnup research and development, highlighting the safety related work, and concludes with a discussion of the implementation of program results in commercial reactors.

30996 (NUREG/CP—0058-Vol.3, pp 574-583) **Radionuclide release to the environment under specific LWR accident conditins.** Gieseke, J.A.; Cybulskis, P.; Denning, R.S.; Kuhlman, M.R.; Lee, K.W. (Battelle Columbus Labs., OH). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

Analyses were performed to obtain more realistic estimates of the release of radionuclides to the environment in severe accidents. Results are presented for a variety of accident sequences in five different LWR plant designs. The predicted environmental release fractions obtained in these analyses are in most cases significantly lower than those in the WASH-1400 study. The methodology developed for this study is expected to form the technical basis for upgrading the methods used to analyze source terms in regulatory practice.

30997 (NUREG/CP—0058-Vol.3, pp 584-594) **Perspectives on technical issues evolving from the source term reassessment.** Denning, R.S. (Battelle Columbus Labs., OH). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

In the Source Term Reassessment Study, analyses have been performed for sequences in six references plants. The number of sequences selected for analysis was limited to a few risk-dominant sequences, augmented by additional sequences that cover a range of severe accident conditions. The computer codes used in the study to predict the thermal-hydraulic behavior, release of fission products from the fuel, transport through the reactor coolant system, transport through the containment and release to the environment are identified. Although major improvements have been made in source term methodology since WASH-1400, a number of residual technical issues have been identified in the Source Term Reassessment Study which lead to substantial uncertainties in source term estimation. The purpose of this paper is to identify the more significant of these issues and to provide perspective on their potential impacts on source term estimates.

30998 (NUREG/CP—0058-Vol.3, pp 607-631) **BWR safety research in Japanese industry.** Omoto, A. (Tokyo Electric Power Company, Inc., Japan). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

The paper describes the events that led to the inception of the Japanese Joint Study research programs for light water reactors and outlines the focus and achievements in reliability and technical development. Safety-related research in the fields of loss of coolant accidents (LOCA), iodine behavior, containment integrity, siting evaluation, and transients and stability are discussed with emphasis on LOCA and ECCS research.

30999 (NUREG/CP—0058-Vol.3, pp 632-650) **LOCA/ECCS integral tests with Two Bundle Loop.** Murase, M.; Ikeda, T.; Naitoh, M. (Energy Research Lab., Hitachi, Japan). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

Simulation tests of a single-ended BWR recirculation line break have been conducted using the Two Bundle Loop (TBL) with two full-size, electrically heated bundles. In the tests, a single failure of the high pressure core spray system was assumed and the test parameter was the break size. The uncovery period and the peak cladding temperature of the heated rods showed maximum values in a small break test; the highest peak cladding temperature was 806°K. Heatup initiations of the rods were delayed in the high power bundle due to the parallel channel effect, in the case of a large break where a mixture level was formed in the lower plenum and liquid drainage was limited at the bundle entry orifices due to the counter-current flow limitation.

31000 (NUREG/CP—0058-Vol.3, pp 651-662) **TBL analysis by best estimate codes.** Matsumoto, T.; Naitoh, M.; Sugisaki, T. (Energy Research Lab., Hitachi, Japan). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

TRAC-BD1 (Version 12) is a three-dimensional thermal-hydraulic code for analyzing boiling water reactor (BWR) loss of coolant accidents (LOCAs). The code was developed by EG and G Idaho, Inc. and General Electric Co. (GE) under the sponsorship of the US Nuclear Regulatory Commission. SAFER, which was developed under the cooperative efforts of GE, Hitachi and Toshiba as a licensing code, is a one-dimensional thermal-hydraulic code for analyzing long term coolant inventory of the reactor system in BWR-LOCAs. Analyses for large and small break tests conducted with the Two-Bundle Loop (TBL) have been performed to assess the capabilities of these codes. The TBL was constructed to simulate thermal-hydraulic behaviors during LOCAs in a BWR/5 plant. It is the only integral test facility with two full size electrically heated bundles and consists of two full length jet pumps, vessel internals, two recirculation loops, two blowdown lines and emergency core cooling systems.

31001 (NUREG/CP—0058-Vol.3, pp 663-674) **TBL analysis by best estimate codes.** Aoki, H.; Itoya, S.; Abe, N.; Arai, K. (Toshiba Corp., Yokohama, Japan). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

SAFER and TRAC-BDI are advanced, realistic-estimate system computer codes for BWR loss-of coolant accident (LOCA) analysis. Analyses of the two bundle loop (TBL) small break loss-of-coolant accident test have been performed using these computer codes. The purpose of these analyses is to assess SAFER and TRAC-BDI for the TBL test results which include the characteristic phenomena due to two channels with full length. This paper describes comparisons between calculations and test data. From present analysis, it was found that both codes predicted overall data trend and key phenomena very well. Furthermore, it was confirmed that SAFER predicted the higher peak cladding temperature due to the conservative heat transfer model.

31002 (NUREG/CP—0058-Vol.3, pp 675-692) **BWR core cooling in refill/reflood phase.** Nagasaka, H.; Yamada, K.; Kuwako, A. (Toshiba Corp., Yokohama, Japan). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

Recent experimental studies investigating a hypothetical boiling water reactor loss of coolant accident (BWR LOCA) have shown that there is a large safety margin in the licensing evaluation code calculations. One of the main reasons is the core cooling model in the current evaluation code, in which the uncovered region of the reactor core is assumed to be cooled only by the rated core spray water. And another is counter current flow limiting (CCFL) phenomena at core inlet orifices, which is neglected in the evaluation model. In the real condition estimated by the integral tests, the lower part of the core is reflooded due to the core inlet CCFL before the lower plenum becomes refilled and the upper part is cooled not only by the spray water but also the lower plenum flashing steam. In addition, when two-phase pool is held up in the upper plenum due to upper tie-plate (UTP) CCFL, the droplets through UTP contribute to the core cooling. To evaluate the core cooling characteristics, the following tests have been performed: (1) steam cooling test; (2) core inlet orifice CCFL test; and (3) spray heat transfer test. This paper summarizes the main results of the tests.

31003 (NUREG/CP—0058-Vol.3, pp 693-705) **BWR upper plenum mixing test.** Miura, S.; Sugisaki, T.; Horiuchi, T. (Hitachi, Ltd., Japan). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

The function of ECCS has been verified by LOCA/ECCS integral test simulating the phenomenon in the reactor pressure vessel from the beginning of LOCA to core reflooding due to ECCS actuation. The test facility which simulates full scale upper core and upper plenum (UPSET: Upper Plenum Simulation Equipment) was developed referring to the BWR plant in order to grasp the thermal hydraulic behaviors in the upper plenum of core under the multi-channel condition same as actual plant. Using this facility, the test to confirm the behavior of spray water in steam atmosphere had been performed. As a result, it was verified that the rate of channel dropping water in peripheral area of core exceeds the limited value of CCFL because of the effect of subcool water from the core spray system, thus contributing to the early core reflooding. Also, it was observed that the spray water is not carried out of system by entrainment and flows in the channel and bypass, thus contributing to the reflooding. Considering the results of LOCA/ECCS integral test, the simulated test of spray water behavior inside the upper plenum from the beginning of LOCA to core reflooding was performed.

31004 (NUREG/CP—0058-Vol.3, pp 706-721) **18° sector system test (ESTA-II).** Nagasaka, H.; Katoh, M.; Yokobori, S. (Toshiba Corp., Kawasaki, Japan). Jan 1985. NTIS, PC A99/MF A01 - GPO $12.00. File Number TI85901093. (CONF-8410142—Vol.3).

From 12. water reactor safety research information meeting; Gaithersburg, MD, USA (23 Oct 1984).

Recent emergency core cooling system (ECCS) tests simulating the hypothetical loss of coolant accident (LOCA) of BWR, have clarified that counter current flow limiting (CCFL) and CCFL breakdown phenomena at upper tie-plate (UTP) and core inlet orifice (SEO) play an important role in BWR refill-reflood phase. The 18° sector test apparatus (ESTA) which mocks up a BWR plant with full height from the jet pump bottom to standpipe top tested the separate effects of CCFL and CCFL breakdown. Following these tests, the apparatus was modified for system interaction testing. The objectives of this system response test by ESTA-II are to assess the multi-channel effect associated with CCFL and CCFL breakdown phenomena at UTPs and SEOs and to evaluate the full-scale, multi-channel refill-reflood scenario. Final goals are to confirm the validity of more realistic evaluation model SAFER, which treats the thermal hydraulic behaviors basically as one dimensional. This paper also includes the analysis of water level transients of each region inside shroud by TRAC-BD1, to check the data of these system tests theoretically.

31005 **(NUREG/CR—2000-Vol.4-No.4) Licensee Event Report (LER) compilation for month of April 1985. Volume 4, No. 4.** (Oak Ridge National Lab., TN (USA)). May 1985. Contract AC05-84OR21400. 85p. (ORNL/NSIC—200-Vol.4-No.4). NTIS, PC A05/MF A01 - GPO. File Number TI85012784.

This monthly report contains Licensee Event Report (LER) operational information that was processed into the LER data file of the Nuclear Safety Information Center (NSIC) during April 1985. The LERs, from which this information is derived, are submitted to the Nuclear Regulatory Commission (NRC) by nuclear power plant licensees in accordance with federal regulations. The LER summaries in this report are arranged alphabetically by facility name and then chronologically by event date for each facility. Component, system, keyword, and component vendor indexes follow the summaries.

31006 **(NUREG/CR—2531-Rev.3) Introductory user's manual for the US Nuclear Regulatory Commission Reactor Safety Research Data Bank. Revision 3.** Hardy, H.A.; Laats, E.T. (EG and G Idaho, Inc., Idaho Falls (USA)). Mar 1985. Contract AC07-76ID01570. 94p. (EGG—2164-Rev.3). NTIS, PC A05/MF A01 - GPO. File Number TI85011271.

The United States Nuclear Regulatory Commission (USNRC) has established the NRC/Division of Accident Evaluation (DAE) Data Bank Program to collect, store, and make available data from the many domestic and foreign water reactor safety research programs. Local direction of the program is provided by EG and G Idaho, Inc., prime contractor for the Department of Energy (DOE) at the Idaho National Engineering Laboratory (INEL). The NRC/DAE Data Bank Program provides a central computer storage mechanism and access software for data to be used by code development and assessment groups in meeting the code correlation needs of the nuclear industry. The administrative portion of the program provides data entry, documentation, training, and advisory services to users and the USNRC. The NRC/DAE Data Bank and the capabilities of the data access software are described in this document.

31007 **(NUREG/CR—2718) Steam explosion experiments with single drops of iron oxide melted with a CO_2 laser. Part II. Parametric studies.** Nelson, L.S.; Duda, P.M. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1985. Contract AC04-76DP00789. 146p. (SAND—82-1105). NTIS, PC A07/MF A01 - GPO. File Number TI85012600.

The steam explosion experiments performed with single drops of molten iron oxide melted with a CO_2 laser, described in Part I of this report, were extended here. The following major parameters were varied: ambient pressure, water temperature and subcooling, melt temperature,and melt composition. Also, a few scoping experiments were performed to explore the effects of changing the nature of the coolant, and the viscosity of the melt. As each of the four major parameters was varied, thresholds could be located beyond which explosions were suppressed. However, in general, the explosions could be reinitiated by increasing the magnitude of the triggering pulse. The effects of increasing the ambient pressure up to 1.12 MPa were faster and finer melt fragmentation, and faster and more complete transfer of heat from melt to water. Moreover, triggering became easier over the range of ambient pressure between about 0.15 MPa and approximately 0.7 MPa.

31008 **(NUREG/CR—3317) Technical bases and user's manual for the prototype of a Suppression Pool Aerosol Removal Code (SPARC).** Owczarski, P.C.; Schreck, R.I.; Postma, A.K. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 65p. (PNL—4742). NTIS, PC A04/MF A01 - GPO. File Number TI85013318.

This code was written to calculate the capture of aerosol particles in the pressure suppression pool (wet well) of a boiling water reactor under hypothetical accident conditions. The code incorporates five aerosol scrubbing models and two thermal-hydraulic models. The scrubbing models describe (1) steam condensation, (2) soluble particle growth in a humid atmosphere, (3) gravitational settling, (4) inertial deposition, (5) diffusional deposition. Mechanical entrainment of pool liquid by breaking of bubbles at the surface was also considered. An optional model for equilibrium pool temperature and a model for steam evaporation are the two thermal-hydraulic models used in the code. Steam evaporation was found to significantly retard deposition processes in pools near the boiling point. The code user supplies the values of several controlling variables in the code input. The SPARC output can include the decontamination factors (DF) of twenty different particle size groups, an overall DF for the whole particle distribution, particle log normal distribution parameters, and mass flow rates of particles (wet and dry) leaving the pool.

31009 **(NUREG/CR—3551) Safety implications associated with in-plant pressurized gas storage and distribution systems in nuclear power plants.** Guymon, R.H.; Casto, W.R.; Compere, E.L. (Oak Ridge National Lab., TN (USA)). May 1985. Contract AC05-84OR21400. 78p. (ORNL/NOAC—214). NTIS, PC A05/MF A01 - GPO. File Number TI85012807.

Storage and handling of compressed gases at nuclear power plants were studied to identify any potential safety hazards. Gases investigated were air, acetylene, carbon dioxide, chlorine, Halon, hydrogen, nitrogen, oxygen, propane, and sulfur hexaflouride. Physical properties of the gases were reviewed as were applicable industrial codes and standards. Incidents involving pressurized gases in general industry and in the nuclear industry were studied. In this report general hazards such as missiles from ruptures, rocketing of cylinders, pipe whipping, asphyxiation, and toxicity are discussed. Even though some serious injuries and deaths over the years have occurred in industries handling and using pressurized gases, the industrial codes, standards, practices, and procedures are very comprehensive. The most important safety consideration in handling gases is the serious enforcement of these well-known and established methods. Recommendations are made concerning compressed gas cylinder missiles, hydrogen line ruptures or leaks, and identification of lines and equipment.

31010 **(NUREG/CR—3651) Assessment of the adequacy of ORNL instrumentation in reflood test facilities.** Hardy, J.E.; Herskovitz, M.B. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 53p. (ORNL/TM—9067). NTIS, PC A04/MF A01 - GPO. File Number TI85010620.

Instrumentation for making two-phase measurements in experimental refill-reflood test facilities was developed through the Advanced Instrumentation for Reflood Studies (AIRS) program. These unique instrumentation systems were designed to survive the severe in-vessel environmental conditions that exist during a simulated pressurized water reactor loss-of-coolant accident (LOCA). The measurements include two-phase flow velocity, void fraction, and film thickness and velocity, and are required for better understanding of reactor behavior during LOCAs. The adequacy (survivability and data quality) of the instrumentation systems installed in four experimental reflood test facilities is assessed. Signal conditioning electronics and sensor thermocouples functioned extremely well. For the first time, two-phase flow measurements were made in-core during a simulated LOCA. Because of the harsh environment and geometrical constraints, some sensor failures were considered likely; the number actually failing in service was within expectations. An exception to this record occurred in the Slab Core Test Facility - Core 1. A chloride-ion stress corrosion problem destroyed signal cables at the vessel seal for most sensors. This problem was corrected by changing the sealant material at the vessel penetration in the subsequent facilities. Overall, the performance of the instrumentation was very satisfactory yielding valuable data during simulated LOCAs in refill-reflood test facilities.

31011 **(NUREG/CR—3810-Vol.4) Reactor safety research programs. Quarterly report, October-December 1984. Volume 4.** Edler, S.K. (ed.). (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 29p. (PNL—5106-4-Vol.4). NTIS, PC A03/MF A01 - GPO. File Number TI85012832.

Results from an instrumented fuel assembly irradiation program being performed at Halden, Norway, are reported. Accelerated pellet-cladding interaction modeling is being conducted to predict the probability of fuel rod failure under normal operating conditions. Experimental data and analytical models are being provided to aid in decision making regarding pipe-to-pipe impacts following postulated breaks in high-energy fluid system piping. Fuel assemblies and analytical support are being provided for experimental programs at the Power Burst Facility, Idaho National Engineering Laboratory, Idaho Falls, Idaho. High-temperature materials property tests are being conducted to provide data on severe core damage fuel behavior. Thermal-hydraulic computer programs are providing best-estimate analyses for a variety of safety issues in light-water reactors. 8 figs., 1 tab.

31012 **(NUREG/CR—3862) Development of transient initiating event frequencies for use in probabilistic risk assessments.** Mackowiak, D.P.; Gentillon, C.D.; Smith, K.L. (EG and G Idaho, Inc., Idaho Falls (USA)). May 1985. Contract AC07-76ID01570. 277p. (EGG—2323). NTIS, PC E14/MF A01 - GPO. File Number TI85013441.

Includes 2 sheets of 24x reduction microfiche.

Transient initiating event frequencies are an essential input to the analysis process of a nuclear power plant probabilistic risk assessment. These frequencies describe events causing or requiring scrams. This report documents an effort to validate and update from other sources a computer-based data file developed by the Electric Power Research Institute (EPRI) describing such events at 52 United States commercial nuclear power plants. Operating information from the United States Nuclear Regulatory Commission on 24 additional plants from their date of commercial operation has been combined with the EPRI data, and the entire data base has been updated to add 1980 through 1983 events for all 76 plants. The validity of the EPRI data and data analysis methodology and the adequacy of the EPRI transient categories are examined. New transient initiating event frequencies are derived from the expanded data base using the EPRI transient categories and data display methods. Upper bounds for these frequencies are also provided. Additional analyses explore changes in the dominant transients, changes in transient outage times and their impact on plant operation, and the effects of power level and scheduled scrams on transient event frequencies. A more rigorous data analysis methodology is developed to encourage further refinement of the transient initiating event frequencies derived herein. Updating the transient event data base resulted in ~2400 events being added to EPRI's ~3000-event data file. The resulting frequency estimates were in most cases lower than those reported by EPRI, but no significant order-of-magnitude changes were noted. The average number of transients per year for the combined data base is 8.5 for pressurized water reactors and 7.4 for boiling water reactors.

31013 **(NUREG/CR—3904) Comparison of uncertainty and sensitivity analysis techniques for computer models.** Iman, R.L.; Helton, J.C. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1985. Contract AC04-76DP00789. 116p. (SAND—84-1461). NTIS, PC A06/MF A01 - GPO. File Number TI85013272.

p.
Uncertainty analysis and sensitivity analysis are important elements in the development and implementation of computer models for complex processes. Typically, there are many uncertainties associated with both the development and the application of such models. Understanding of these uncertainties and their causes is required to effectively interpret model behavior. Many different techniques have been proposed for performing uncertainty and sensitivity analyses. The objective of the present study is to compare several widely used techniques on three models having large uncertainties and varying degrees of complexity in order to highlight some of the problem areas that must be addressed in actual applications. The following approaches to uncertainty and sensitivity analysis are considered: (1) response surface methodology based on input determined from a fractional factorial design, (2) Latin hypercube sampling with and without regression analysis, and (3) differential analysis. These techniques are compared on the basis of (1) ease of implementation, (2) flexibility, (3) estimation of the cumulative distribution function of the output, and (4) adaptability to different methods of sensitivity analysis. With respect to these criteria, the technique using Latin hypercube sampling and regression analysis gives the best results overall. The models used in the comparisons are well documented, thus making it possible for researchers to make comparisons of other techniques with the results in this study.

31014 **(NUREG/CR—3977) RELAP5 thermal-hydraulic analyses of pressurized thermal shock sequences for the H.B. Robinson Unit 2 pressurized water reactor.** Fletcher, C.D.; Bolander, M.A.; Waterman, M.E.; Burtt, J.D.; Stitt, B.D.; Kullberg, C.M.; Davis, C.B.; Ogden, D.M. (EG and G Idaho, Inc., Idaho Falls (USA)). Apr 1985. Contract AC07-76ID01570. 233p. (EGG—2341). NTIS, PC A11/MF A01 - GPO. File Number TI85012870.

Thermal-hydraulic analyses of fourteen hypothetical pressurized thermal shock (PTS) scenarios for the H.B. Robinson, Unit 2 pressurized water reactor were performed using the RELAP5 computer code. The scenarios, which were developed at Oak Ridge National Laboratory (ORNL), contain significant conservatisms concerning equipment failures, operator actions, or both.

31015 **(NUREG/CR—3980-Vol.3) Light-water-reactor safety fuel systems research programs. Quarterly progress report, July-September 1984. Volume 3.** (Argonne National Lab., IL (USA)). Apr 1985. Contract W-31-109-ENG-38. 48p. (ANL—84-61-Vol.3). NTIS, PC A03/MF A01 - GPO. File Number TI85011200.

This progress report summarizes work performed by the Materials Science and Technology Division of Argonne National Laboratory during July, August, and September 1984 on water reactor safety problems related to fuel and cladding. The research and development areas covered are Transient Fuel Response and Fission Product Release and Clad Properties for Code Verification. 17 refs., 23 figs., 5 tabs.

31016 **(NUREG/CR—4044) TRAC-PF1 LOCA calculations using fine-node and coarse-node input models.** Dobranich, D.; Buxton, L.D.; Wong, C.N.C. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 83p. (SAND—2305). NTIS, PC A05/MF A01 - GPO. File Number TI85013275.

TRAC-PF1 calculations of a 200% cold-leg break LOCA have been completed for a UHI (upper head injection accumulator) plant using both fine-node (with 776 mesh cells) and coarse-node (with 320 mesh cells) input models. This study was performed to determine the effect of noding on predicted results and on computer running time. It was found that the overall sequence of events and the important trends of the transient were predicted to be nearly the same with both the fine-node and coarse-node models. There were differences in the time-dependent behavior of the cold-leg accumulator injection, and the predicted PCT for the coarse-node calculation was about 75 K less than that for the fine-node calculation. The higher PCT of the fine-node calculation is attributed primarily to three-dimensional flow effects in the core. The complete (steady state plus transient) coarse-node calculation required 13.5 hours of CYBER 76 computer time compared to 68.3 hours for the fine node calculation, yielding an overall factor of five decrease in running time. Thus, we conclude that for any large break LOCA analyses in which only the overall trends are of concern, the loss of accuracy resulting from use of such a coarse-node model will normally be inconsequential compared to the savings in resources that are realized. However, if the objective of the analyses is the investigation of the effects of multi-dimensional flows on clad temperatures, then a detailed model is required.

31017 (NUREG/CR—4079) Analytic studies pertaining to steam generator tube rupture accidents. Kashiwa, B.A.; Mjolsness, R.C. (Los Alamos National Lab., NM (USA)). Mar 1985. Contract W-7405-ENG-36. 83p. (LA—10307-MS). NTIS, PC A05/MF A01 - GPO. File Number TI85010350.

A study of the thermal-hydraulic phenomena of possible steam generator tube rupture (SGTR) accidents leads to the conclusions that (1) flashing will not occur upstream of the tube rupture, so that the flow will be resistance limited rather than choked, (2) there is considerable potential for discharging the primary fluid in the form of micron-sized droplets, particularly when the fluid discharges into a vapor cavity surrounding the tube rupture, and (3) that the surrounding of the rupture site by water rather than vapor may be a means for preventing the formation of micron-sized droplets. The presence or absence of micron-sized droplets is considered to be a key issue for the damage assessment of SGTR accidents because they are currently throught to be the most likely route for radioactive iodine to be released to the atmosphere.

31018 (NUREG/CR—4093) Safety/safeguards interactions during safety-related emergencies at Nuclear Power Reactor Facilities. Moul, D.A.; Pilgrim, M.K.; Schweizer, R.L.; McEwen, J.E. Jr. (Brookhaven National Lab., Upton, NY (USA); Wackenhut Advanced Technologies Corp., Reston, VA (USA)). Mar 1985. Contract AC02-76CH00016. 228p. (BNL-NUREG—51848). NTIS, PC A11/MF A01 - GPO. File Number TI85012310.

This report contains an analysis of the safety/safeguards interactions that could occur during safety-related emergencies at licensed nuclear power reactors, and the extent to which these interactions are addressed in existing or proposed NRC guidance. The safety/safeguards interaction during a series of postulated emergencies was systematically examined to identify any potential performance deficiencies or conflicts between the Operations (safety) and Security (safeguards) organizations. This examination included the impacts of coordination with off-site emergency response personnel. Duties, responsibilities, optimal methods, and procedural actions inherent in these interactions were explored.

31019 (NUREG/CR—4105) Assessment of thermal gradient tube results from the HI series of fission product release tests. Norwood, K.S. (Oak Ridge National Lab., TN (USA)). Mar 1985. Contract AC05-84OR21400. 63p. (ORNL/TM—9506). NTIS, PC A04/MF A01. File Number TI85010347.

A thermal gradient tube was used to analyze fission product vapors released from fuel heated in the HI test series. Complete deposition profiles were obtained for Cs, I, Ag, and Sb. The cesium profiles were complex and probably were dominated by Cs-S-O compounds formed by release of sulfur from furnace ceramics. The iodine profiles were simple, indicating that more than 99.5% of the released iodine behaved as a single nonvolatile species, probably CsI. Mass transfer coefficients for this species onto platinum were estimated to be 1.9 to 5.8 cm/s. Silver was probably released in elemental form, condensed to an aerosol, and captured by filters. Antimony was released as the element and reacted rapidly with platinum (or gold) as it deposited. Antimony profiles were calculated a priori with some success. A method was developed for isolating tellurium from platinum and mixed fission products in a form suitable for neutron activation analysis. The platinum samples were completely dissolved in acid (HCl/HNO_3), and the tellurium was precipitated on selenium carrier by reduction. Finally, tellurium was loaded onto Dowex 1X-4 ion-exchange resin for activation and analysis. Tellurium recovery was ~ 88%, and the theoretical sensitivity was ~ 30 ng.

31020 (NUREG/CR—4106) Pressurized-thermal-shock test of 6-in.-thick pressure vessels. PTSE-1: investigation of warm prestressing and upper-shelf arrest. Bryan, R.H.; Bass, B.R.; Bolt, S.E.; Bryson, J.W.; Edmonds, D.P.; McCulloch, R.W.; Merkle, J.G.; Nanstad, R.K.; Robinson, G.C.; Thoms, K.R. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 289p. (ORNL—6135). NTIS, PC A13/MF A01 - GPO. File Number TI85010580.

The first pressurized-thermal-shock test of a 148-mm-thick steel pressure vessel with a 1-m-long flaw was performed to investigate fracture behavior of a vessel under conditions relevant to a flawed nuclear reactor pressure vessel during an overcooling accident. The objectives were to observe crack arrest and stability on the ductile upper shelf and the effects of warm prestressing on crack initiation. Three coordinated pressure and thermal transients were imposed on the vessel, which was preheated to ~290°C. Two episodes of crack propagation and arrest occurred. The thermal transients were induced by coolant at -29 to 15°C. Pressure transients were as high as 94.4 MPa. The experimental objectives were attained. The inhibiting effects of warm prestressing were definitely demonstrated. Crack propagation was nearly pure cleavage. Fracture-mechanics analysis of brittle fracture based on small-specimen toughness measurements was reasonably accurate.

31021 (NUREG/CR—4140) Dominant accident sequences in Oconee-1 pressurized water reactor. Dearing, J.F.; Henninger, R.J.; Nassersharif, B. (Los Alamos National Lab., NM (USA)). Apr 1985. Contract W-7405-ENG-36. 108p. (LA—10351-MS). NTIS, PC A06/MF A01 - GPO. File Number TI85013270.

A set of dominant accident sequences in the Oconee-1 pressurized water reactor was selected using probabilistic risk analysis methods. Because some accident scenarios were similar, a subset of four accident sequences was selected to be analyzed with the Transient Reactor Analysis Code (TRAC) to further our insights into similar types of accidents. The sequences selected were loss-of-feedwater, small-small break loss-of-coolant, loss-of-feedwater-initiated transient without scram, and interfacing systems loss-of-coolant accidents. The normal plant response and the impact of equipment availability and potential operator actions were also examined. Strategies were developed for operator actions not covered in existing emergency operator guidelines and were tested using TRAC simulations to evaluate their effectiveness in preventing core uncovery and maintaining core cooling.

31022 (NUREG/CR—4168) GT2F: a computer code for estimating light water reactor fuel rod failures. Williford, R.E.; Lanning, D.D.; Beyer, C.E. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 275p. (PNL—5354). NTIS, PC A12/MF A01 - GPO. File Number TI85012551.

This report describes the development, benchmarking and results of a computer code designed to permit comparison of BWR and PWR fuel rod failure behaviors during postulated reactor off-normal events such as control rod withdrawal errors. The code is called GT2F, and was developed from the GAPCON-THERMAL-2 code by the addition of new models for calculating transient temperatures, fission gas release, mechanical interaction between fuel and cladding, and Zircaloy cladding fracture behavior. Results indicate that for the conservatively severe overpower transient scenarios assumed, a full length commercial BWR fuel rod has a failure probability between 1% and 4.5% at 27 MWd/kgM when the transient begins from high operating power. A full-length commercial PWR fuel rod has a failure probability between 2% and 11% at 28 MWd/kgM when the transient begins from low power. Failure probabilities are substantially smaller at lower burnups and for less extreme transient conditions.

31023 (NUREG/CR—4177-Vol.1) Management of severe accidents. Perspectives on managing severe accidents in commercial nuclear power plants. Vol. 1. DiSalvo, R.; Leonard, M.; Manahan, M.; Wreathall, J. (Battelle Columbus Labs., OH (USA)). May 1985. 98p. (BMI—2123-Vol.1). NTIS, PC A05/MF A01 - GPO. File Number TI85901530.

Accident management is examined from several different perspectives. The emphasis is on the role of the operating crew and the technical support provided to them before, during, and after an accident. The relationship among accident management, risk management, and emergency management is examined. The roles played by industry, regulation, and research are reviewed. Finally, the results of viewing accident management from these various perspectives are reflected in the articulation of issues and some proposals for their resolution.

31024 (NUREG/CR—4177-Vol.2) **Management of severe accidents. Extending plant operating procedures into the severe accident regime. Vol. 2.** Wreathall, J.; Leonard, M.; DiSalvo, R. (Battelle Columbus Labs., OH (USA)). May 1985. 73p. (BMI—2123-Vol.2). NTIS, PC A04/MF A01 - GPO. File Number TI85901531.

This study examines the feasibility and value/impact of extending emergency operating procedures into the severe accident regime. It reviews the types of knowledge needed to develop such procedures and the applicability of existing regulatory review criteria. A method is developed and illustrated in two test cases. This study concludes that it is feasible to develop procedures for operators to mitigate the consequences of accident progressing past the onset of core damage. A preliminary value/impact assessment indicates a significant likelihood of there being an overall net positive benefit of developing mitigative procedures. A phased program has been proposed. First a pilot study should develop the application of the methods used in this feasibility study and provide more precise information for a detailed value-impact assessment. Based on the results of the pilot study, extension to a greater population of plants may be justified.

31025 (NUREG/CR—4196) **Overview of TRAC-BD1 (Version 12) assessment studies.** Kullberg, C.M. (EG and G Idaho, Inc., Idaho Falls (USA)). Apr 1985. Contract AC07-76ID01570. 51p. (EGG—2382). NTIS, PC E07/MF $6.75 - GPO. File Number TI85012991.

Includes 15 sheets of 24x reduction microfiche.

A series of simulations were performed to continue the advancement of Boiling Water Reactor (BWR) safety research, with the TRAC-BD1 (Version 12) computer code. The principal motivation for performing these simulations was to assess the code's capability to calculate Loss-of-Coolant Accident (LOCA) related phenomena. The results of a number of TRAC-BD1 (Version 12) simulations, which cover a broad range of conditions during different types of LOCA scenarios, are summarized in this document. Selected comparisons between calculated and measured results are presented. Conclusions derived from those comparisons are given.

31026 (NUREG/CR—4205) **TRAP-MELT2 user's manual.** Jordan, H.; Kuhlman, M.R. (Battelle Columbus Labs., OH (USA)). May 1985. 71p. (BMI—2124). NTIS, PC A04/MF A01 - GPO. File Number TI85901543.

In hypothetical severe accidents in light water reactors, radionuclides released from the melting core will undergo chemical and physical changes and will deposit on various surfaces as they are transported through the reactor coolant system (RCS) to the containment. It is of considerable interest to know what fraction of these released materials actually reaches the containment and is potentially available for leakage to the environment. The TRAP-MELT2 computer code contains radionuclide transport and deposition models that are consistent with the emerging state of knowledge regarding release of radionuclides from melting cores and thermal-hydraulic behavior of the RCS during hypothetical meltdown accidents. This model is a modification and further development of the previously published TRAP-LOCA code developed for analysis of fission product transport and deposition in a terminated loss-of-coolant accident and the TRAP-MELT code described in a previous manual.

31027 (NUREG/CR—4230) **Probability-based evaluation of selected fire protection features in nuclear power plants.** Azarm, M.A.; Boccio, J.L. (Brookhaven National Lab., Upton, NY (USA)). May 1985. Contract AC02-76CH00016. 91p. (BNL-NUREG—51878). NTIS, PC A05/MF A01 - GPO. File Number TI85013092.

A probabilistic approach for the evaluation of major fire protection measures in nuclear power plants is described. The methods developed are applied to two representative fire areas - one similar to a cable routing room and the other typical of a diesel generator room. The fire areas chosen for application, the fire scenarios described, and the various fire-damage states specified in the two illustrative examples are used to evaluate those fire-protection guidelines which deal with automatic/manual fire detection and suppression systems, rated barriers, divisional separation, drainage systems, dampers, and fire rating of electrical cables. Tabular results are presented, which reflect the relative merits of these systems/features in terms of conditional probabilities of achieving various room-damage states. The conclusions drawn and the lessons learned through the course of this study are discussed, and the areas that may need further investigation are identified.

31028 (NUREG/CR—4231) **Evaluation of available data for probabilistic risk assessments (PRA) of fire events at nuclear power plants.** Krasner, L.M.; Ganti, C.S.; Vincent, B.G.; Samanta, P.K.; Boccio, J.L. (Factory Mutual Research Corp., Norwood, MA (USA); Brookhaven National Lab., Upton, NY (USA)). May 1985. Contract AC02-76CH00016. 71p. (BNL-NUREG—51879). NTIS, PC A04/MF A01 - GPO. File Number TI85013093.

Several crucial parameters are needed in the assessment of fire risk in nuclear power plants. Among those that need to be developed from a data base are: (1) fire frequency, (2) fire detection time, and (3) fire suppression time. Currently, the data base for nuclear power plants is not large enough to develop these parameters, considering fuel location, fuel geometry, combustion properties, enclosure geometry, etc. This study attempts to augment the nuclear data base by investigating the usefulness of other nonnuclear data bases which contain fire incident loss experience of occupancy classes having somewhat similar physical features and fire protection engineering systems normally found in nuclear power plants. This study has found that indeed some useful information can be gleaned from nonnuclear sources; in particular, detection and suppression times. However, other fire-risk data needs such as fire frequency and fire size would require other forms of data searches and data analyses that at this stage can only be conceptualized.

31029 (NUREG/CR—4254) **Occupational dose reduction and ALARA at nuclear power plants: study on high-dose jobs, radwaste handling, and ALARA incentives.** Dionne, B.J.; Baum, J.W. (Brookhaven National Lab., Upton, NY (USA)). May 1985. Contract AC02-76CH00016. 102p. (BNL-NUREG—51888). NTIS, PC A06/MF A01 - GPO. File Number TI85013084.

This report provides the NRC and the nuclear industry with information and data which will be useful for occupational dose reduction at nuclear power plants. An examination of high-dose jobs, reliable equipment selection, radioactive waste handling improvements, and ALARA incentives at nuclear power plants has been performed. The information and data in this report are being provided to the nuclear power industry not only for purposes of occupational dose reduction at nuclear power plants but also to reduce the cost to generate electricity through cost savings associated with dose reduction. 15 refs., 6 figs., 10 tabs.

31030 (NUREG/CR—4262-Vol.1) **Effects of control system failures on transients and accidents at a General Electric boiling water reactor. Volume 1. Main report.** Bruske, S.J.; Baxter, D.E.; Ransom, C.B.; Stromberg, H.M.; Fineman, C.P.; Hanson, R.G. (EG and G Idaho, Inc., Idaho Falls (USA)). May 1985. Contract AC07-76ID01570. 84p. (EGG—2394-Vol.1). NTIS, PC A05/MF A01 - GPO. File Number TI85013358.

This report documents the evaluation of the effects of nonsafety grade control system failures on a typical boiling water reactor plant. The methods utilized in this evaluation include a system level failure modes and effects analysis, deterministic computer analysis, a review of 3 years of recorded plant occurrences, a probability analysis and a review of applicable NRC criteria pertaining to control systems. This study identified three system failures that could cause transients leading to a reactor vessel overfill and of these three failures, two could also lead to a reactor coolant cooldown of greater than 100°F per hour. This study concluded that the existing NRC criteria, concerning control systems, adequately address the potential problem areas that were identified during this evaluation. It was recommended that the consequences and risk associated with overfill and overcool transients be further investigated.

31031 **(NUREG/CR—4262-Vol.2) Effects of control system failures on transients and accidents at a General Electric boiling water reactor. Volume 2. Appendices.** Bruske, S.J.; Baxter, D.E.; Ransom, C.B.; Stromberg, H.M.; Fineman, C.P.; Hanson, R.G. (EG and G Idaho, Inc., Idaho Falls (USA)). May 1985. Contract AC07-76ID01570. 340p. (EGG—2394-Vol.2). NTIS, PC A15/MF A01 - GPO. File Number TI85013359.

The following appendices are included: Failure mode and effects analysis tables, Detailed BWR computer model description, Scenario computer analysis and effects, BWR failure data base search, and Significant transient excerpts.

31032 **(ORNL/TM—8842) Review of the status of validation of the computer codes used in the severe accident source term reassessment study (BMI-2104).** Kress, T.S. (comp.). (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 477p. NTIS, PC A21/MF A01 - GPO. File Number TI85010582.

The determination of severe accident source terms must, by necessity it seems, rely heavily on the use of complex computer codes. Source term acceptability, therefore, rests on the assessed validity of such codes. Consequently, one element of NRC's recent efforts to reassess LWR severe accident source terms is to provide a review of the status of validation of the computer codes used in the reassessment. The results of this review is the subject of this document. The separate review documents compiled in this report were used as a resource along with the results of the BMI-2104 study by BCL and the QUEST study by SNL to arrive at a more-or-less independent appraisal of the status of source term modeling at this time.

31033 **(PNL-SA—12829) ESF collection effectiveness, a study in fine particle dynamics.** Winegardner, W.K.; Owczarski, P.C. (Pacific Northwest Labs., Richland, WA (USA)). Apr 1985. Contract AC06-76RL01830. 17p. (CONF-850406—7). NTIS, PC A02/MF A01 - GPO. File Number TI85010966.

From International symposium and workshop on particulate and multi-phase processes and the 16th annual meeting of the Fine Particle Society; Miami Beach, FL, USA (22 Apr 1985).

The characterization and dynamic behavior of fine particles are the main subjects of an ongoing investigation of the particle collection effectiveness of the engineered safety feature (ESF) systems in nuclear power plants. This investigation is part of a larger study of the release of radionuclides to the environment from such plants during postulated accidents that are severe but extremely unlikely. The ESF systems are installed to prevent the occurrence of severe accidents or mitigate their consequences. Several of these engineered systems can serve as particle collection devices. This report focuses on the analytical models that were developed to predict particle behavior in two systems that were not specifically designed for particle retention: the ice compartments of ice condenser containment systems in Pressurized Water Reactors (PWRs) and the suppression pools of Boiling Water Reactors (BWRs). The following section summarizes the topics considered in the development of models and computer codes for estimating the particle retention effectiveness of these two ESF systems. After the summary this paper describes the two ESF systems in more detail and discusses the behavior of particles in both situations.

31034 **(SAND—84-2043C) Investigation of fuel and clad relocation during LMFBR initiation phase accidents: the STAR experiment program.** Wright, S.A.; Schumacher, G.; Henkel, P.R. (Sandia National Labs., Albuquerque, NM (USA); Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). 1985. Contract AC04-76DP00789. 10p. (CONF-850410—51). NTIS, PC A02/MF A01; 1 - GPO; GPO Dep. File Number TI85012354.

From ANS/ENS fast reactor safety meeting; Knoxville, TN, USA (21 Apr 1985).

The reactivity effects of fuel and clad motion during Unprotected Loss of Flow accidents (ULOFs) strongly influence the accident progression in LMFBRs. To study these phenomena, a series of in-pile experiments (the STAR experiments) are being performed in which clad motion and fuel dispersal are observed in small pin bundles with high-speed cinematography. The major parameters varied in the series are power level, fuel type (fresh versus preirradiated), and number of pins. Results of the first four experiments are presented in the report. The irradiated fuel tests show early fuel disruption caused by fission products followed by rapid fuel sweep out and axial clad relocation.

31035 **(SKBF-KBS-TR—79-21) Technology and cost for decommissioning Swedish nuclear power plants.** (Swedish Nuclear Fuel Supply Co., Stockholm. Div. KBS). Oct 1979. 184p. (In Swedish). NTIS (US Sales Only), PC A09/MF A01. File Number DE85701245.

Various estimates concerning the costs of decommissioning a redundant nuclear power reactor to the green fields state are given in the literature. The purpose of this study is to provide background material for the Swedish nuclear power utilities to estimate the costs and time required to dismantle an ASEA-ATOM Boiling Water Reactor. The units Oskarshamn II and Barsebeck 1, both with an installed capacity of approximately 600 MW, serve as reference plants. The time of operation before final shutdown is assumed to be 40 years. Dismantling operations are initiated one year after shutdown. When the dismantling of the plant is finished the site shall be released for unrestricted use. The costs for dismantling and subsequent final disposal of the radioactive waste are estimated to approximately 500 million Swedish crowns (approx. 115 MUS$) in terms of 1979 crowns. The sum includes 25 per cent contingency. The dismantling cost is equivalent to 10-15 per cent of the installation cost of a corresponding new nuclear power plant. The exact percentage is dependent on the interest rate used during the construction period. It is shown in the study that a total dismantling can be accomplished in less than five years. This report is a compilation of studies performed by ASEA-ATOM and VBB based on premises given by KBS. The reports from these studies are collected in appendices, where also a short technical description of one of the reference plants is given.

31036 **(SKI-B—6-83) Thermal fatigue cracking in T-fittings of feed water systems. Development of testing methods for the determination of the depth of cracks.** Oesterberg, J. (Swedish Nuclear Power Inspectorate, Stockholm; Swedish Plant Inspectorate, Stockholm). Mar 1983. 171p. (In English and Swedish). NTIS (US Sales Only), PC A08/MF A01. File Number DE85701242.

The existence of thermal fatigue cracks can be determined by ultrasonic methods. The depth of the cracks will be of importance for evaluation of the seriousness of the situation. Currently, no method is available for determining depth of cracks without cutting and grinding. Methods for gaining information of crack depth have been discussed with leading European materials testing institutes. More elaborate ultrasonic methods have been tested with negative results. On testing signals from crack corners flood possible signals from the crack tips. At present no reliable technique based on ultrasonics exist (in Europe, that will give information of crack depth.

31037 **(SKI-B—32-82) Project CSNI - CASP. Summarizing final report 1983-03-15.** Marklund, J.E. (Swedish Nuclear Power Inspectorate, Stockholm). Mar 1983. 22p. (In Swedish). (STUDSVIK-SD—83-11; STUDSVIK-NR—83-248). NTIS (US Sales Only), PC A02/MF A01. File Number DE85701240.

The report contains a brief summary of the results of the February 1982 meeting of the Containment Working Group within OECD-CSNI/NEA. It also contains a summary of a parameter study made with the Swedish computer program COPTA on the OECD-CSNI containment standard problem CASP2. The tasks of the Containment Working Group has later been transferred to a new larger group PWG2 Transients and Breaks. Among the containment issues treated in this last meeting were -standards prob-

lems, and Benchmark problems, -State-of-the-art reports, -test sites and ongoing research, -The hydrogen question, including a large EC study.

31038 (PNL-tr—447) **Feasibility of dismantling the biological shield by the blast-hole technique. Final report.** Freund, H.U.; Schumann, S.; Bol, J.; Haas, W.; Kaul, J.; Nickel, N.; Witterhold, F.G.; Rossmann, K. (Pacific Northwest Labs., Richland, WA (USA); Battelle-Institut e.V., Frankfurt am Main (Germany, F.R.)). 7 May 1985. Contract AC06-76RL01830. Translation of BIeV-R-65.036-4, August 1983. 173p. NTIS (US Sales Only), PC A08/MF A01; 1; GPO Dep. File Number DE85012910.

In order to demolish a decommissioned nuclear power plant, the first step is necessarily dismantling of the activated and contaminated structures. A careful explosive dismantling technique is developed for separation of the radioactive inner part of the biological shield (steel-reinforced concrete) of light-water reactors, and the parameters which determine the effectiveness of the technique are examined. These parameters include those characteristics of the technique which depend on the blast-hole technique, as well as the side effects on the surroundings, particularly building shock load and release and containment of aerosols. It is concluded that stepwise separation of the radioactive concrete can be achieved in several large-area blasts in compliance with the safety regulations. In this process the radioactive concrete is ejected in the form of small-size rubble from the reinforcing framework, so that the reinforcing bars, which contain the major part of the radioactivity, can be conditioned separately.

31039 (LA-tr—85-26) **Transient three-phase three-component systems. Part 1. Formulation of the system of differential equations.** Kolev, N.I. (Los Alamos National Lab., NM (USA); Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). 1985. Contract W-7405-ENG-36. Translation of KfK-3910. 64p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85013267.

On the basis of the laws of conservation, the non-conservative form of a system of 18 quasi-linear partial differential equations was developed to describe a three-phase, three-component flow. The flow was described with three fields of velocity. Each field of flow consists of one inert and one non-inert component. Full thermodynamic and mechanical non-equilibrium between the fields was modeled. The simplest possible concentrations and entropy equations were obtained, with no simplifying assumptions. Also obtained was the definition of the Mach number and of the critical mass velocity, and thus the local criticality condition.

31040 **Hydrogen combustion in nuclear plant accidents and associated containment loads.** Sherman, M.P. (Sandia National Labs., Albuquerque, NM (USA)). *Nuclear Engineering and Design;* **82**: No. 1, 13-24(Oct 1984). (CONF-830864—). Contract AC04-76DP00789.

From 4. international seminar on fluid/structure dynamics and containment of nuclear reactors; Chicago, IL, USA (29 Aug 1983).

The objective of this paper is to describe the reactor safety problems in severe accidents due to hydrogen combustion. The generation of hydrogen is discussed. The combustion of hydrogen is considered in terms of diffusion flames, deflagrations, flammability limits, incomplete combustion of very lean deflagrations, detonations and accelerated flames. An example of analyses of hydrogen combustion in a Mark III BWR is given. The example shows the strong dependence of the predicted peak pressure and number of burns on the assumptions of the analyses, the compartmentalization of the model and the inclusion of buoyancy-driven flows.

31041 **Transport and release of fission products during nuclear reactor accident.** Lee, K.W.; Kuhlman, M.R.; Gieseke, J.A. (Battelle Columbus Labs., OH (USA)). pp 441-444 of '84 Proceedings of Korea symposium on science and technology. Seoul, Republic of Korea; The Korean Federation of Scientific and Technological Societies (1984). (CONF-840765—).

From Korea international symposium on science and technology; Seoul, Korea (2 Jul 1984).

This study represents the identification and formulation of a systematic, mechanistic approach to estimating source terms and the implementation of this approach through calculations of fission products release to the environment for a large PWR reactor under a selected set of accident conditions. The development and improvement of calculational procedures is an evolutionary process and in the long term must be verified through experimental studies. It is anticipated that as additional information is obtained the accuracy of predictions can be improved and uncertainties reduced. Transport and deposition of radionuclides were found to be quite dependent on the accident sequences and the corresponding thremal hydraulic conditions. Reduced temperatures led to increased deposition of vapor species, and reduced flow rates to increased aerosol deposition. It is to be recognized that the estimates of release fractions are subject to uncertainties in the data and computer models employed in the calculations and are expected to have been influenced by assumptions regarding plant geometry, thermal hydraulics, deposition mechanisms, and sequence events. The effects of these assumptions will be investigated as this study continues.

25 ENERGY STORAGE

2502 Compressed Gas

31042 (TVA/PUB—84/21c, pp 1408-1417) **Compressed air energy storage at New York State hydropower sites.** Pakenas, L.J.; Driggs, C.L. (New York State Energy Research and Development Authority, Albany). 1983. NTIS, PC A20/MF A01. File Number DE84007687. (CONF-830939—Vol.3).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The use of hydraulic air compressors and air expander turbines to generate electric power from low-head hydropower sites on rivers, streams, and other bodies of water is evaluated. The concept is referred to as Air Storage Hydro. The evaluation of this concept has concentrated on plant capacities in the range of 1 to 5 MW at sites in New York State offering 15 feet of head or less. The hydraulic air compressor (HAC) is a low technology device, involving construction of underground shafts in rock formations. The HAC produces compressed air using water flowing through a change in stream elevation. Air is entrained in a water flow (in the form of bubbles) and compressed in a falling column of water. The air is allowed to separate out in a stilling chamber, where it is collected and stored for use. Process water subsequently returns to the source stream at a lower elevation. Environmental, regulatory and land use restrictions do not appear to represent major obstacles. Water quality may actually be improved by a plant installation as water passing through an HAC becomes saturated with oxygen. Capital costs of the studied plant arrangements ranged from $900 to $1300 per kilowatt, assuming 15 feet of head and single 5 MW fuel-fired turbine set. The plant competes with combustion turbines, cycling oil-fired steam plants, pumped storage, and purchase power on a cost of production basis. The plant also competes with development of conventional run-of-river hydro at the same site. Selection of the development approach requires a comparison of return on investment.

onds. The managerial control of commissioning activities and early operating problems are discussed.

31044 (TVA/PUB—84/21b, pp 832-840) **Technology in manufacturing and operation of hydraulic turbines.** Okada, M.; Senco, K.; Yokoyama, T. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

To take advantages of hydroelectric power, trends of hydraulic turbine technology is diverging to large capacity of a unit and to small-scaled low head plant. Under this circumstance, hydraulic performance is being improved by introducing computer-aided flow analysis and leakage water reduction. Reliability of mechanical parts is being secured by applying finite element method and field-measured information to static and dynamic strength of runner. For more economical pumped-storage plant, a double stage pump-turbine with regulatory guide vanes up to 1000m head has been developed and is being developed up to 1500m head. Important field data of transient draft-pressure drop after load rejection and of condenser operation are fed back to the planning and designing of more advanced pump-turbines.

31045 (TVA/PUB—84/21b, pp 851-860) **Putting Raccoon Mountain pumped-storage plant to work.** Adkins, F.E. (Tennessee Valley Authority, Chattanooga). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The Raccoon Mountain plant is still a pumped-storage plant of significant dimension. So far as is known, the power capacity of the individual reversing units has not yet been exceeded in service elsewhere. The assimilation of the plant as a functioning unit of the TVA power system is described and the changes made and experiences gained in moving toward that end are discussed. A variety of delays has occurred. Many of these are traceable to random hydraulic forces generated during the operation of the pump-turbines. These appear to have been greater than anticipated. Cavitation erosion of the pump-turbine runners was another major problem. A variety of setbacks occurred in the generators including a major stator winding failure and a cracked shaft forging. The semiconductor start-stop converter-inverter for pump starting, etc., has worked very satisfactorily. Switchgear at generator terminal voltage appears to be overworked in terms of the frequency of its operation. In the main switchyard, exploding 161-kV current transformers were a problem; operation of the plant could have been limited by the late arrival of the 161/500-kV transformers. The in-plant control system, as designed, worked almost without fault; but developing experience showed that for safe operation the plant would need a greater degree of manned operation than had been planned. It was also found desirable to provide local supervision and a maintenance force dedicated solely to this plant. Operating experience, as it affects the power system, is discussed. In the conclusions efforts are made to identify areas where further evaluation might lead to improvements.

31046 (TVA/PUB—84/21b, pp 861-870) **Salina Pumped-Storage Project - design and operating history.** Holway, D.K.; Moody, J.R. Jr. (Benham-Blair-Holway and Spragins, Tulsa, OK). 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

The design, operating history and economics of the Salina Pumped-Storage Project are described. This project is one of the nation's earliest reversible-unit hydroelectric power projects. The project is owned and operated by the State of Oklahoma, Grand River Dam Authority, and is located in northeastern Oklahoma. The four-phase project will ultimately include 12 units with a maximum production capability of 520 MW. Construction began in 1965, with the first phase (3 units) in July 1971. The third and fourth phases are pending. Since the first phase of the project began commercial operation in 1968, the project has experienced a successful operating record of 15 years with relatively minor operating problems.

31047 (TVA/PUB—84/21b, pp 871-880) **Ludington Pumped Storage - ten years later.** Seguin, R.L. 1983. NTIS, PC A99/MF A01. File Number DE84008049. (CONF-830939—Vol.2).

From Waterpower '83 - international conference on hydropower; Knoxville, TN, USA (18 Sep 1983).

A summation of the design and operating problems that have occurred at the Ludington Pumped Storage Plant during the first ten years of operation is presented. The remedies to these problems are also discussed with a review of those involved.

31048 (DTH-LET-RE—84-1) **Seasonal thermal energy storage in district heating systems.** Boldt, J.; Qvale, B. (Danmarks Tekniske Hojskole, Lyngby. Lab. for Energiteknik). Sep 1984. 223p. NTIS (US Sales Only), PC A10/MF A01. File Number DE85750797.

The technical and economic aspects of incorporating large-scale seasonal thermal energy storage into existing or planned district heating systems have been studied with the help of mathematical systems simulation. Realistic systems (present and future) and components have been used. The aim has been to arrive at results that could be generalized. The study has been limited to seasonal storage with only one storage cycle per year. Seasonal heat storage has been examined in relation to two types of district heating systems: Systems with a major part of the heat generated by cogeneration plants, and systems, where the main part of the heat is delivered from low-temperature heat sources, such as industrial surplus heat. Finally, the use of seasonal heat stores in connection with long-distance heat transmission pipelines have been studied.

31049 (FRNC-TH—1612) **Study of phase transitions of macroscopic and dispersed salt hydrates. Application to low temperature heat storage.** Combes, B. (Pau Univ., 64 (France)). Jun 1982. 150p. (In French). NTIS (US Sales Only), PC A07. File Number DE85751346.

Phase transformations of materials with latent heat adapted to low temperature thermal storage is studied. Three salt hydrates: sodium sulfate, thiosulfate, acetate and a ternary mixture of water, sodium sulfate and sodium carbonate are examined. Volumes of few cubic centimeters or cubic millimeters are studied during heating and cooling cycles. Thermal performance of the ternary mixture is evaluated. Dispersions of salt hydrate systems are studied for long term heat storage and heat recovery by induced nucleation.

2508 Chemical

31050 (DGRST—80-7-0026) **Thermocompressor or heat pump using metal hydrides.** Blondeau, M.; Bonneton, M.; Jannot, M. (Delegation Generale a la Recherche Scientifique et Technique (DGRST), 75 - Paris (France)). Aug 1981. 154p. (In French). NTIS (US Sales Only), PC A08. File Number DE85751352.

Metallic hydrides present interesting prospects for use in hydrogen storage and in thermodynamic sorption-desorption cycle machines. First the state of art of work at national and international level are exposed. The technical study leads to the choice of an exchanger technology, and to the development of a model and a test bed which allows one to simulate the thermocompressor function. The tests produce information regarding the choice of parameters with a view to designing "three source" thermodynamic machines. The hybride $LaNi_5$ is chosen for the tests. Analysis of the results, evaluations of the performances anticipated of hybride based machines and orientations of further research are given.

31051 (NP—5770294) **Energy storage by means of chemical reactions.** Iyimen-Schwarz, Z. (Osnabrueck Univ. (Germany, F.R.). Fachbereich Biologie/Chemie). 1983. 151p. (In German). NTIS (US Sales Only), PC A08/MF A01. File Number DE85770294.

A number of hydrates, alcoholates and hydrogen carbonates were studied with a view to their suitability as thermochemical energy storage media in the low-temperature range. The following hydrates were investigated: potassium alum, magnesium chloride-6-hydrate, calcium chloride-2-hydrate, strontium chloride-6-hydrate, barium chloride-2-hydrate, and calcium chloride semihydrate. Other substances studied were alcoholates of MgCl and CaCl with methanol and ethanol. Sodium bicarbonate and potassium bicarbonate have high energy densities. However, the reaction between two gaseous components poses some problems. The author's experiments did not result in definite statements on the storage characteristics of the substances investigated. A more accurate assessment requires further studies of a large number of cycles and a further scale-up (e.g. up to 1 m^3).

31052 (AD-A—151975/0/XAB) **Calcium/thionyl chloride battery technology. Interim report, June 1983-May 1984.** Higgins, R.I.; Potts, I. (Eagle-Picher Industries, Inc., Joplin, MO (USA). Electronics Div.). Jan 1985. 51p. NTIS, PC A04/MF A01.

This program is structured to develop both active and reserve configuration calcium-thionyl chloride electrochemical cells. The active configuration has required extensive work toward the storability on the calcium anode in electrolyte solution. A variety of electrolyte salts have been screened in an effort to improve storage characteristics. The reserve configuration could lend itself to high-temperature operation since calcium has such a high melting point when compared to lithium. Emphasis has been on the development of a high-discharge-rate cathode structure.

31053 (ANL/OEPM—85-1) **Development of a supported liquid membrane as a nickel-zinc secondary battery separator.** Poa, D.S.; Miller, J.F.; Yao, N.P. (Argonne National Lab., IL (USA)). May 1985. Contract W-31-109-ENG-38. 36p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012591.

A liquid tertiary amine complexing agent is dissolved in an organic solvent and absorbed into and held within the pores of a microporous polymeric film (Celanese Celgard 2400 polypropylene) by either capillary or surface force. Screening tests were performed to identify the optimum tertiary amine/organic solvent combinations, as well as the optimum concentration range of the amine solutions. The treatment of Celgard 2400 microporous film with certain tertiary amine/organic solvent solutions, such as triethylamine/xylene or tripropylamine/xylene, had no significant effect on either zinc penetration resistivity (ZPR) or electrolytic resistivity of the membrane. When the film was treated with tri-n-octylamine solutions of very high amine concentration (above 75 vol %), the potential difference between the zinc cathode and the $Ni(OH)_2$ counter electrode, as well as the electrolytic resistance of the membrane, increased sharply (from 300 to 700%). Among the tertiary amine solutions tested in this study, trihexylamine/xylene, tri-n-octylamine (10 to 30 vol %)/toluene, and tri-n-octylamine (10 to 30 vol %)/xylene appeared to be the most promising, especially the last one. The treatment of the Celgard 2400 film with that solution increased the zinc penetration resistivity of the membrane by as much as 400%. Furthermore, this solution treatment also improved the electrolytic conductivity of the Celgard 2400 film.

31103 **(EPRI-EM—3872) Updated cost estimate and benefit analysis of customer-owned battery energy storage.** Stolte, W.J.; Eckroad, S.W. (Bechtel Group, Inc., San Francisco, CA (USA)). Jan 1985. 137p. Research Reports Center, P.O. Box 50490, Palo Alto, CA 94303 $16.00. File Number TI85920552.

Previous phases of EPRI Research Project 1275-12 have shown that, for appropriate load demand situations, commercially available battery systems can be an economically and technically viable approach to load management, providing benefits to both electric utilities and their customers. Phase I (reported in EPRI EM-2769) estimated equipment costs and economic feasibility of generically defined systems. Phase II (EPRI EM-3535) determined economic benefits for sixteen specific utility customer applications. The results of a third phase of the project are presented. Phase I equipment, balance-of-plant (BOP) and operating costs have been refined and a simplified method of estimating economic benefit for specific customer applications is developed. The refined costs and benefit analysis method were based on a relatively detailed conceptual engineering design and cost analysis of a 500 kWh/500 kW lead-acid battery storage plant. Comparison of Phase III costs with the initial Phase I cost estimates indicates that while estimated battery costs have decreased, estimated converter and BOP costs have increased. Maintenance costs are also larger than initially estimated. Although overall estimated system costs have increased over initial estimates, customer-side battery storage plants remain economically attractive for many customer load profiles and existing utility rate structures. A standardized plant design with substantially reduced footprint, to be investigated in Phase IV of the project, would reduce costs and make even more attractive the use of batteries as a load-management tool.

31104 **(N—85-17130) Polymer electrolytes: an investigation of some poly (N-propylaziridine)/lithium salt compositions.** Baldwin, K.R.; Golder, A.J.; Knight, J. (Royal Aircraft Establishment, Farnborough (UK)). Apr 1984. 26p. (RAE-TR—84036). NTIS, PC A03/MF A01.

Poly (N-propylaziridine)/lithium salt compositions were synthesized and their electrical conductivities were measured to assess their suitability as electrolytes in safe, leakproof, high energy-density lithium batteries operating at ambient temperature. The effects on conductivity of temperature, and the nature and concentration of the salt were studied. The salts markedly improve conductivity of the compositions over that of the undoped polymer but they are insufficiently conducting to be considered as battery electrolytes, due possibly to ion pairing. Their creep resistance is also low. Less fluid compositions containing higher molecular weight polymers better able to promote ion separation are more suitable. (ESA)

31105 **(SAND—83-2269) Characterization of sheet calcium for Ca/CaCrO$_4$ thermal batteries.** Guidotti, R.A.; Reinhardt, F.W.; Nelson, G.C. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1985. Contract AC04-76DP00789. 46p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85013231.

The physical and chemical properties of sheet calcium were examined in an attempt to explain the varied performance of different lots in five-cell Ca/CaCrO$_4$ thermal batteries. Properties evaluated included microhardness, phase and texture analysis, heat capacity, melting point, transition temperature, and heat of transition. The surface chemistry was examined by Auger electron spectroscopy, secondary ion mass spectroscopy, and low-energy ion-scattering spectroscopy. None of these properties could be correlated to battery performance. The bulk chemistry of the calcium was characterized by analysis for metallic and interstitial impurities. Only the nitrogen content exerted any measurable influence upon battery performance, with the best overall results observed for samples with >0.40% nitrogen.

31106 **(SAND—83-2334-Rev.) Testing of sealed lead-acid batteries. Revision.** Bush, D.M.; Sealey, J.D.; Miller, D.W. (Sandia National Labs., Albuquerque, NM (USA)). May 1985. Contract AC04-76DP00789. 20p. NTIS, PC A02/MF A01. File Number DE85011804.

Supersedes SAND—83-2334, February 1984.

In early January 1981, Sandia began testing sealed lead-acid batteries which were being developed under Sandia contracts. Goal was to develop a totally maintenance-free sealed lead-acid battery capable of deep-discharge operation in a photovoltaic power system. During contracts with Gould and Eagle-Picher, batteries were received quarterly and placed on test. Testing of these batteries has now been completed. With proper charging, battery life averaged over 800 deep cycles. This was achieved with both the standard NEMA cycle test as well as a partial state of charge test. Charging voltages above 2.50 volts per cell appeared to be detrimental to the performance of the Gould batteries.

31107 **(SAND—84-0799) Final battery evaluation report: Energy Research Corporation zinc/bromine battery.** Butler, P.C.; Miller, D.W.; Robinson, C.E.; Leo, A. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1984. Contract AC04-76DP00789. 194p. NTIS, PC A09/MF A01; 1; GPO Dep. File Number DE85011144.

The results of an evaluation of an Energy Research Corporation zinc/bromine, flowing electrolyte battery are described. This work was performed at Sandia National Laboratories for the US Department of Energy and the Electric Power Research Institute. Included in the report is a description of the battery, charge/discharge cycle test results, failure analysis investigations, and conclusions summarizing what was learned from the evaluation. Extensive appendices are included with detailed descriptions, data, and failure analyses photographs. The battery operated for 163 charge/discharge cycles with an average electrochemical energy efficiency of 54 +- 10%. The primary causes of failure were electrode de-bonding from flow frame assemblies and non-uniform electrolyte flow distribution.

31108 **(SAND—84-1098) Characterization of cathodic corrosion products in the Ca/CaCrO$_4$ thermal battery.** Guidotti, R.A.; Reinhardt, F.W.; Venturini, E.L.; Rogers, J.W. Jr.; Cathey, W.N. (Sandia National Labs., Albuquerque, NM (USA); Nevada Univ., Reno (USA). Dept. of Physics). May 1985. Contract AC04-76DP00789. 35p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85013442.

Using thermal analysis techniques, we investigated the corrosion process resulting from the reaction of iron, nickel, and stainless steel (used as current collectors in Ca/CaCrO$_4$ thermal batteries) with CaCrO$_4$ dissolved in LiCl-KCl eutectic. The reaction product for iron was synthesized in bulk external to the battery and was characterized by chemical analysis, X-ray diffraction, Moessbauer spectroscopy, X-ray photoelectron spectroscopy, static magnetization, and electrical conductivity. This characterization provides a better understanding of the cathodic corrosion processes that occur in the Ca/CaCrO$_4$ thermal battery, and how the properties of the reaction layer at the catholyte-current collector interface influence battery performance.

31109 **(SAND—85-7194) Cationic exchange membrane for the zinc-ferricyanide battery. Final report.** Pemsler, J.P.; Dempsey, M.D. (Castle Technology Corp., Woburn, MA (USA)). May 1985. Contract AC04-76DP00789. 47p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85013152.

In this one year effort of research into supported-liquid-membrane (SLM) separators for the zinc-ferricyanide battery systems, at least one SLM separator (80% LT27/M80 on 0.13 mm PTFE), has been found that approaches the required specifications with separator resistance in the 2 to 3 ohm-cm^2 range, 1 x 10^{-3} mmoles Fe/h-cm^2 iron transport and 2 x 10^{-4} mmoles Zn/h-cm^2 zinc transport. This separator is still being tested in a 60-cm^2 zinc-ferricyanide battery and is exhibiting encouraging results.

31110 **Batteries.** Cairns, E.J. (Lawrence Berkeley Lab., CA). pp 287-321 of Molten salt technology. Lovering, D.G. (ed.). New York, NY; Plenum Publishing Corporation (1982). Contract W-7405-ENG-48.

This article discusses the use of molten salts in advanced batteries. Molten salts play an important role as electrolyte in several types of batteries that operate at elevated temperatures. Guidelines are presented for the selection of the constituents of electrochemical cells intended to meet the goals of high specific energy, high specific power, and long life. The characteristics, state of development, and areas requiring additional research for the following combinations of negative electrode reactants, electrolytes and positive electrode reactants are discussed: LiAl/LiCl-KCl/FeS_2, Li_4Si/LiCl-KCl/FeS_2, Ca-Al-Si/LiCl-NaCl-$CaCl_2$-$BaCl_2$/FeS_2, Li/Li^+ solid/S, Na/Na^+ solid/S, Na/Na^+ solid/SCl_3AlCl_4 in $AlCl_3$-NaCl, Na/Na^+ solid/S_2Cl_3 in $AlCl_3$.

29 ENERGY PLANNING AND POLICY

31111 **(GAO/RCED—85-41) Corps of Engineers should revise its policy for identifying unneeded land.** (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 22 Mar 1985. 45p. US General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20760. File Number TI85901452.

This report discusses the Corps' program, including the federal land disposal requirements which must be met before land can be sold, and the effect that selling federal land can have on certain users of such land.

31112 **(PB—85-169340/XAB) Energy data and conversion factors - a New Zealand handbook (first edition).** Baines, J.T. (New Zealand Energy Research and Development Committee, Auckland). May 1984. 100p. (REPT—100). NTIS, PC E05/MF E01.

In January 1982, at a meeting of interested parties in Wellington, a decision was taken to compile a booklet of energy conversion factors suitable for planning work (rather than detailed technical work). The main aims underlying the provision of such a booklet are: to encourage the widespread and consistent use of uniform raw energy data and conversion factors by making available a ready-reference handbook appropriate to New Zealand circumstances; and to familiarise non-specialist users of energy data with the important factors that affect the appropriateness and accuracy of energy data. The handbook is not intended to meet the more precise informational needs of detailed technical analysis. Thus it was considered inappropriate to develop the descriptive content in greater detail.

2901 Energy Analysis And Modeling

REFER ALSO TO CITATION(S) 30401, 31143

31113 **(DOE/EIA—0293(85)) Directory of Energy Information Administration model abstracts.** (USDOE Energy Information Administration, Washington, DC. Office of Statistical Standards). May 1985. 60p. NTIS, PC A04/MF A01 - GPO; GPO Dep. File Number DE85013050.

This report presents extended abstracts of active Energy Information Administration (EIA) models. The documentation requirements for active models are described by the EIA in Order EI 5910.3A. Model types within the active category are (1) basic, (2) auxiliary, and (3) developmental. Basic models are ones "designated by the Administrator as being sufficiently important to require sustained support and public scrutiny." Auxiliary models are "used only occasionally in analysis and therefore" require "minimal levels of documentation." Developing models are "... of sufficient interest to require a basic level of documentation at a future date."

31114 **(NP—5750799) Model specifications for energy models used in Scandinavia.** (Nordisk Ministerraad). Nov 1983. 58p. (In several languages). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750799.

A list of energy model programmes used in the Scandinavian countries is presented. Information is given on the institution that has developed the model and a description of the model is also presented. The models are divided into two groups, economic models and technical models. Specially Denmark and Finland have experience with technical models, while Norway and Sweden concentrate on economic models.

31115 **(PB—85-169159/XAB) Regional energy planning: a review. Final report.** (New Zealand Energy Research and Development Committee, Auckland). Jun 1984. 55p. (REPT—106). NTIS, PC E04/MF E01.

This review examines a number of regional energy studies and the approaches being adopted by Regional and United Councils to deal with energy considerations. The importance of energy planning at the regional level is demonstrated together with its relevance to other aspects of regional planning. Guidelines for the identification of energy issues and priorities and effective methods of dealing with these through the regional planning process are suggested.

2902 Economics And Sociology

31116 **(N—85-16375) Energy and climate: problems in Latin America.** Barros, V. (Consejo Nacional de Investigaciones Cientificas y Tecnicas, Buenos Aires (Argentina)). 1984. 14p. NTIS MF A01.

In WMO, climate conference for Latin America and the Caribbean, 394-407 p. (N—85-16352 07-47).

The effect of climate on the demand, supply and use of energy in Latin America during the rest of the century is discussed. It is thought that the demand for climatological information on the part of the energy sector will increase and will require the development of suitable techniques for processing the inadequate basic information. The effects related to carbon dioxide release are described. The region's collaboration in international efforts to study this topic is favored. (ESA)

2903 Environment, Health, And Safety

REFER ALSO TO CITATION(S) 29737, 29901, 29961, 30009, 30010, 30660, 30661, 31151, 31366, 31367, 32122, 32125, 32127, 32128, 32129, 32133, 32168, 32190, 32202, 32203, 32204, 32205, 32206, 32207, 32208, 32327, 32380, 32381

31117 **(CERT/TR—82-623) Tribal environmental review process: manual and permits directory.** (Council of Energy Resource Tribes, Englewood, CO (USA)). Dec 1982. Contract FG01-81EV10654. 150p. NTIS, PC A07/MF A01; GPO Dep. File Number DE85012012.

This manual presents a model process for obtaining environmental permits for major energy projects on Indian lands. Environmental approvals for major energy and industrial projects are often characterized by controversy, prolonged and inefficient reviews, and lack of coordination among government agencies. The process described in this manual, called the "tribal environmental review process," was designed to address these problems as well as the unique challenges posed by permitting on Indian lands. In addition, the manual can be used to manage environmental permitting of other major nonenergy projects. The recommended tribal environmental review process offers a flexible, innovative approach to environmental permitting. It is an intergovernmental process to coordinate federal and tribal environmental review procedures for energy projects. The process also promotes active participation by state and local agencies and the public. Four stages - initiation of the process, organization, preapplication coordination, and synchronization of permitting - comprise the process. It is based entirely on existing regulations and participation is voluntary. However, a formal management structure, written agreements, and commitments to a regulatory decision schedule help to ensure full agency participation in the process. A comprehensive analysis of the various federal permit requirements applicable to energy development on Indian lands is presented. Information regarding applicability, permitting application requirements and procedures, environmental standards and conditions, and time frames are described. In addition, a review of federal non-permit requirements that can reasonably be expected to impact energy development on Indian lands is also presented. State and local environmental authorities that should be considered in concert with any large-scale energy project on Indian lands are summarized.

31118 **(CONF-840612—18-Rev.) Forecasting future industrial SO$_2$ and NO/sub x/ emissions. Revised.** Graves, K.; Pechan, E.; Briggs, B.; Turner, D. (Pechan (E.H.) and Associates, Inc., Springfield, VA (USA); USDOE, Washington, DC). 1984. Contract AI01-83PE70494. 16p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011243.

From Air Pollution Control Association annual meeting; San Francisco, CA, USA (25 Jun 1984).

This paper presents estimates of future emissions from various economic source sectors with a focus on those emissions associated with industrial activities. These estimates were obtained from the Environmental Trends Analysis Model (ETAM). These projections are based on energy and economic projections made by DOE and on data inputs from other sources and models. In this paper we present an overview of sulfur dioxide (SO$_2$) and nitrogen oxide (NO/sub x/) emission trends to the year 2010 from the industrial sector within the context of total anthropogenic emissions. 12 refs., 3 figs., 3 tabs.

31119 **(CONF-8505149—1) Examples of regional environmental assessment using acid deposition data.** Olson, R.J.; Turner, R.S.; Allison, L.J. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 27p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012903.

From National conference on hazardous wastes and environmental emergencies; Cincinnati, OH, USA (14 May 1985).

Integrated assessments of acid deposition impacts require data on pollutant emissions, pollutant deposition, air quality, aquatic resources, crops, forests, and manmade materials. These data must have common spatial and temporal attributes that can be readily accessed for statistical analysis, modeling, and display purposes. The Acid Deposition Assessment Staff of Task Group I established the Acid Deposition Data Network (ADDNET) at Oak Ridge National Laboratory to provide accurate and reliable data to conduct assessment and policy analysis for the National Acid Precipitation Assessment Program (NAPAP). Although specific projects and task groups within NAPAP collect and analyze individual data files, ADDNET assembles selected files, verifies their contents, conducts quality assurance, maintains documentation, and makes data available to the NAPAP community. The ADDNET data base contains over 65 'certified' data sets that have been screened to ensure consistency across all areas of the assessment. Two applications of the ADDNET Data Base to assessment activities are described: estimation of the extent of sensitive lakes at risk to high atmospheric deposition and the mapping of regional soil properties according to hypothesized sensitivity criteria. Both examples cover New York and the New England states and show the integration of data from diverse sources for analyses. The data resources and the regional environmental assessment approach described here can be applied directly to other hazardous materials discussed at this symposium. 13 refs., 6 figs.

31120 **Energy and water development appropriations for 1986. Part 8. Hearings before a Subcommittee of the Committee on Appropriations, House of Representatives, Ninety-Ninth Congress, First Session.** Washington, DC; Government Printing Office (1985). 1732p.

Part 8 of the hearing record covers the testimony of Members of Congress and other interested parties on the funding of energy and water projects for fiscal year 1986. The volume opens with the testimony of 20 California congressmen on various projects either underway or proposed for the state. Projects in California, West Virginia, Florida, and elsewhere included flood control, dredging for navigation, research on wave oscillation, hydroelectric power plants and water reservoirs, and erosion control. DOE projects included both nuclear and non-nuclear research programs and power marketing administration. The record covers the testimony of over 700 witnesses, who describe program status, plans, and budget needs.

31121 **(DEMO—83/1G) Ground radiometric anomalies of the Serres Basin.** Kyrtsou, C. (Democritos Nuclear Research Center, Athens (Greece)). Jan 1983. 47p. (In Greek). NTIS (US Sales Only), PC A03/MF A01. File Number DE85701220.

This work deals with the geology and radioactivity of a part of the Serres Basin which is made up by the Tertiary sedimentary sequence, peculiar toward the western edge of Rhodope, with lignites occurring locally. The area is transected by three northwesterly trending major faults having a throw of over 150 m. The purpose of this work was the location of as many as possible areas exhibiting a radioactivity much higher than the normal background, as well as their comparison and classification in orders of magnitude. The background radioactivity in the area varies between 150 to 200 c/s; deviations higher than this range area considered to be anomalous. An area of 75 km^2 has been explored where 170 sites exhibiting high radioactivity ranging from 2 to 20 times the background have been located; description of these areas appears in the tables. Of the 170 sites 100 refer to lignite bearing argillaceous sandstone formations, while the rest of them consists of altered sandstones, fossiliferous limestones and other sedimentary sequences.

31122 **(NP—5750806) Report of the Joint Committee for mineral resources in Greenland in the period 1 July 1983-30 June 1984.** (Raastofforvaltningen for Groenland, Copenhagen (Denmark)). 1984. 64p. (In Danish). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750806.

Activities of the Joint Committee for mineral resources in Greenland are reviewed. A number of licenses for oil and gas exploration, granite exploitation and nickel, chromite and ruby minerals recovery have been issued. Hydro power projects, comprehending site selection, meteorologic and hydrologic exploration and environmental impacts of the prospective sites are implemented by the Joint Committee as well as Greenland Geological Survey, and financed by Ministry for Greenland with subsidy from EEC. Coal deposits mining is evaluated. Hydrocarbon exploration is concentrated around Jameson Land.

31123 **(NP—5750812) Specifications of mineral concessions and licences in Greenland as of June 30, 1984.** (Raastofforvaltningen for Groenland, Copenhagen (Denmark)). Jul 1984. 16p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85750812.

In connection with the introduction of Home Rule in Greenland a special mineral resources scheme was established. A Mineral Resources Administration under the Minister for Greenland will be responsible for the major administrative tasks as regards mineral resources. In principle, the mineral resources scheme includes all nonliving natural resources, comprising in particular mineral resources and hydro power. The basis of the mineral resource scheme is to recognize that "the resident population of Greenland has fundamental rights with respect to the natural resources in Greenland". The mineral resources scheme involves a joint decisionmaking power to the State Authorities and to the Home Rule Authorities relating to the essential arrangements with regard to nonliving natural resources in Greenland. The prospecting licence gives the licensee access to the performance of preliminary geological investigations, but it is not connected with any kind of exclusive rights and does not involve priority with regard to future exclusive rights concessions. The exploration concession is an exclusive rights concession and implies in certain circumstances, a right of priority to the concessionaire with regard to any future grants of exploitation rights, provided that as a result of the investigation activities exploitable mineral deposits are found. The exploitation concession is an exclusive rights concession containing detailed terms of further stated exploitation activities. An updated specification of the mineral concessions and licences in Greenland, which are valid as of June 30, 1984, is enclosed. Applications and inquiries concerning mineral resources etc. in Greenland are consequently in the first phase to be addressed to the Mineral Resources Administration.

2905 Research, Development, Demonstration, And Commercialization

31124 **(AECL—8102) 1982-1983 annual report [Atomic Energy of Canada Ltd.].** (Atomic Energy of Canada Ltd., Ottawa, Ontario). 1983. 64p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85701287.

French version included as AECL-8102F.

Atomic Energy of Canada Ltd. continued to improve on its operating results and financial position with record net earnings of $22.6 million, an increase of 15 percent. Commercial revenue from exports was 53 percent. Revenue from nuclear supply and services declined to $218.9 million as reactor projects neared completion or were deferred. Radiation equipment and isotope sales increased by 25 percent to $84.3 million. This revenue included the first shipment of a Canadian cancer therapy accelerator, isotope production from the new cyclotron, and radiopharmaceutical products. Pickering Generating Station revenue was $38.1 million, an increase of 28 percent. Heavy water production increased by 21 percent and unit operating costs decreased by 9 percent due to increased productivity. Operating profit from commercial operations of $25.8 million was slightly lower, due to increased product development costs and marketing expenses. Studies were made of the long-term behaviour of pressure and calandria tubes in CANDU reactors. Cesium and iodine released from fuel in a hypothetical accident would be retained within the system to a much greater degree than was previously believed, according to other basic research studies. Comprehensive safeguards systems and equipment developed in collaboration with the IAEA were installed on the four 600MW CANDU units which began operating. Experiments testing a process to extract useful by-products from used CANDU fuel were completed using facilities in Italy. Future developments using by-products in combination with uranium or thorium will ensure CANDU's long-term viability.

31125 **(ANL/CNSV-TM—156) Direct and indirect costs arising from implementation of new engines.** Santini, D.J. (Argonne National Lab., IL (USA)). Mar 1985. Contract W-31-109-ENG-38. 67p. NTIS, PC A04/MF A01; GPO Dep. File Number DE85012287.

This report assesses the costs of engine innovation to vehicle manufacturers in particular and to the nation's economy (where all manufacturers introduce new engines simultaneously) in general. The costs of a new passenger-car internal-combustion engine (ICE), including associated transmission costs, are estimated to be $0.8 to 1.4 billion (1981 dollars). The economical volume of production is estimated to be 250,000 units annually. The rate of introduction of new engines - examined over several decades - is found to be highly variable, but the process is synchronized across all manufacturers (simultaneous introduction); changes in fuel cost and quality provide the synchronizing mechanism. Simultaneous introduction of new engines and fuels drives up the real costs of vehicle ownership; the consequent withdrawal of consumers from the marketplace causes vehicle output to fall sharply. Depending on the severity of the cost increases and the duration of the engine-introduction period, the indirect costs to the nation may include a recession, a "stagnation," or a depression. A historical review (including the nineteenth century) shows that this phenomenon is quite general in nature. Advanced research leading to lower costs and greater success in the introduction of new engines could help reduce the indirect costs to the nation. Successful engine innovations improve vehicular efficiency and performance, boosting long-term economic growth. The desirability of research on two innovative automotive engines - the Brayton-cycle and Stirling engines - is assessed.

31126 **(DOE/CE—0111) Geothermal energy technology program summary.** (Conservation and Renewable Energy Inquiry and Referral Service, Silver Spring, MD (USA)). May 1985. Contract AC01-83CE30780. 4p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013101.

FS 200, 1st Edition.

The progress to date of the geothermal energy program of the US Department of Energy is briefly summarized, including federal/industry cooperation, program focus, and a budget summary. (ACR)

31127 **(DOE/CE—0122) National Awards Program for Energy Innovation 1984. Project descriptions.** (USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC). 1985. 404p. NTIS $18.25/MF A01; 1; GPO Dep. File Number DE85011096.

This collection of outstanding energy projects is the result of a nationwide search for innovative programs and technologies which began in the fall of 1983, when the Department of Energy (DOE) launched the National Awards Program for Energy Innovation. These projects were already underway as schools, companies, communities, and other organizations looked for ways to reduce their energy bills. As part of Technology Transfer 80's, DOE's program to encourage the sharing of energy-saving accomplishments and technologies, we decided to work with the Governors and their Energy Offices to identify and publicize innovative energy-saving ideas. The projects presented in this book were selected by the Governors and nominated for National Awards. Those marked with asterisks received Special Recognition Awards.

31128 **(DOE/METC—84-23, pp 631-633) United States Trade and Development Programs in transferring United States technology.** Bobel, R. Jun 1984. NTIS, PC A99/MF A01. File Number DE84009251. (CONF-8010382—).

From Morocco/United States oil shale colloquium; Rabat, Morocco (1 Oct 1980).

The US Government's Trade and Development Program and how it tries to advance the difficult process of world economic development is discussed. The purpose of the Trade and Development Program, or TDP, is to promote technology cooperation between the US and, principally, the more rapidly-developing middle income countries, such as Morocco. The main task is to stimulate technology transfer from the US from simplest technologies to the highest technologies. Over the next two fiscal years the total budget for program operations on a worldwide basis is limited to $12 million. The types of activities that TDP can engage in include the following: on a selected basis, invitational travel for foreign officials considering a major project investment to visit the US to view US technology and operations; second, technical symposia, such as this one; and third, project preparations services, ranging from project identification and definitional studies through pre-feasibility studies to full feasibility studies. IDP does not finance final design, nor the operational costs of projects. Trade and Development Program financing is usually offered on a grant basis either through direct contact with American firms or other US government agencies or by passing funds to host governments, which then select American firms or Americans in association with local partners to carry out project studies.

31129 **(NP—5901429) Hawaii Natural Energy Institute annual report, 1984.** (Hawaii Univ., Honolulu (USA). Hawaii Natural Energy Inst.). 1984. 184p. University of Hawaii at Manoa, Honolulu, HI. File Number TI85901429.

This tenth anniversary special reviews each project over the past 10 years, with research in progress included for FY83-84 for biomass, geothermal, ocean energy, solar energy, wind research and other renewable energy research. (PSB)

31130 **(RISO-M—2442) Health Physics Department annual progress report 1 January-31 December 1983.** (Risoe National Lab., Roskilde (Denmark)). Aug 1984. 39p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85701288.

The report describes the work of the Health Physics Department at Risoe during 1983. The activities cover dosimetry, instrumentation, radioecology, risk by nuclear activities and nuclear emergency preparedness. Lists of staff and publications are included. A great deal of the work in the department is of minor interest to people outside Risoe as it represents service functions. Therefore, the main emphasis in the report has been placed on scientific and contractual work.

31131 **Department of Energy Civilian Energy Programs Authorization Act for fiscal years 1986, 1987, and 1988. Part 1. A report submitted to the House of Representatives, Ninety-Ninth Congress, First Session, April 22, 1985.** Washington, DC; Government Printing Office (1985). 101p.

The House Committee on Science and Technology report on legislation authorizing DOE appropriations (H.R.1799) suggests several amendments to line item amounts. The report describes the background of the bill and the hearings and actions of the committee. The bulk of the report is devoted to the programs covered by the legislation, including research and development on energy conservation, renewable energy sources, fossil energy, nuclear energy, high energy and nuclear physics. The report analyzes and compares the proposed budget of $5872 million in 1986, $6359 million in 1987, and $6393 million in 1988 with one developed by the Congressional Budget Office. Estimated receipts reduce the net outlays to $1064 million, $3692 million, and $4411 million for the respective years. Additional and dissenting views appear at the end of the report.

31132 **Authorizing appropriations to the Department of Energy for civilian energy programs for fiscal year 1986 and fiscal year 1987, and for other purposes. A report to the House of Representatives, Ninety-Ninth Congress, First Session, May 15, 1985.** Washington, DC; Government Printing Office (1985). 18p.

The Committee on Interior and Insular Affairs report on H.R. 2041 is favorable toward the authorization of DOE civilian nuclear and non-nuclear energy projects in the 1986 budget. There are a number of amendments which adjust budget figures either up or down. The committee approved expenditures of $2613.3 million out of the $2622.5 million of the $5495 million budget request over which it has jurisdiction. Significant changes were a decrease in light water reactor technology and departmental administration, and an increase in low-level nuclear waste technology and power marketing administration. The report explains the justifications for these changes, such as changes in the world enriched uranium market, and estimates the net cost to the government at $3563 million. The report compares 1985 appropriations, 1986 requests, and 1986 appropriations. 6 tables.

2906 Nuclear Energy

31133 **(AD-A—151602/0/XAB) Nuclear winter: environmental and human consequences of nuclear war - a selected bibliography.** (Army War Coll., Carlisle Barracks, PA (USA)). Feb 1985. 8p. NTIS, PC A02/MF A01.

Existing studies by Soviet and American scientists have concluded that nuclear war might cause a global climatic catastrophe. The effects of nuclear war on the climate are being investigated and suggest a massive death of plants, animals and humans in ice-age conditions that would last for more than a year. Although there is increasing emphasis on this catastrophic hypothesis, a dearth of literature has been published to date. Researchers will find that the references cited in this bibliography constitute a basis for a beginning evaluation of the subject. Both pro and con viewpoints of this new hypothesis are presented in the bibliographic citations. The list is not comprehensive and contains only material which is readily available in the USAWC Library collection.

31134 **(DOE/EA—0270) Environmental assessment: the proposed settlement of Washington Nuclear Project No. 3 lawsuits.** (USDOE Bonneville Power Administration, Portland, OR. Office of Power and Resources Management). May 1985. 108p. NTIS, PC A06/MF A01; GPO Dep. File Number DE85012983.

Details of the proposed settlement are presented where the key issues are: (1) BPA's alleged obligation to fund completion of WNP-3 from revenues; (2) the Supply System's obligation to construct WNP-3 to completion; (3) whether delay will increase costs to complete the plant; and (4) the utilities' need for power from the plant.

31135 **(DOE/S—0035) Light-water reactor research and development.** (USDOE Office of Energy Research, Washington, DC. Energy Research Advisory Board). May 1985. 71p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85013255.

This report on the national program of research and development on light water reactors is the second of two reports requested in 1982 by W. Kenneth Davis, Deputy Secretary of the Department of Energy. A first report, published in September 1983, treated the needs for safety-related R & D. In this second report, the Energy Research Advisory Board finds that, although many light water reactors are providing reliable and economic electricity, it appears unlikely that U.S. utilities will order additional reactors until the currently unacceptable economic risk, created by the regulatory climate and uncertain demand, is reduced. Thus it is unlikely that the private sector alone will fund major LWR design improvements. However, nuclear power will continue on its current course of expansion overseas. DOE participation is vitally needed to support the national interest in LWR technology. The report outlines R and D needs for a program to improve the safety, reliability, and economics of the present generation of plants; to develop evolutionary improved designs to be ready when needed; and to explore innovative longer-term concepts for deployment after the year 2000. The respective roles of government and the private sector are discussed.

31136 **Energy and water development appropriations for 1986. Part 7. Hearings before a Subcommittee of the Committee on Appropriations, House of Representatives, Ninety-Ninth Congress, First Session.** Washington, DC; Government Printing Office (1985). 1266p.

Part 7 of the hearing record covers three areas of the DOE appropriations: Atomic Energy Defense activities, power marketing administrations, and departmental administration. Representatives of DOE and the US Army reviewed the nuclear defense mission and activities under the defense and arms control programs. The administrators of the Alaska, Bonneville, Southeastern, Southwestern, and Western Power Administrations and a representative of the Conservation and Renewable Energy division described programs and budget requirements, as well as estimates of power demands for their regions. Administrative personnel described DOE procedures and explained the budget requests. Supporting documentation accompanies the testimony of the 16 witnesses.

31137 (DOE/METC—84-23, pp 23-30) **Energy situation in Morocco and its perspectives.** Sdiqui, M. (Ministry of Energy and Mines, Morocco). Jun 1984. NTIS, PC A99/MF A01. File Number DE84009251. (CONF-8010382—).

From Morocco/United States oil shale colloquium; Rabat, Morocco (1 Oct 1980).

The energy situation in Morocco and its perspectives for the future are summarized. Morocco's supplies of energy are ensured by the following primary resources: hydroelectric, coal, crude petroleum, and natural gas. The first three of these resources are domestic, the fourth almost entirely imported. The prospects for developing hydro, coal, and petroleum resources are discussed.

31138 (DOE/METC—84-23, pp 31-48) **Review of the US energy situation.** Schora, F.C.; Seay, J.G. (Gas Development Corp., Chicago, IL). Jun 1984. NTIS, PC A99/MF A01. File Number DE84009251. (CONF-8010382—).

From Morocco/United States oil shale colloquium; Rabat, Morocco (1 Oct 1980).

The growth rate of energy consumption in the US has declined sharply due to the combined effects of the recession, higher energy prices, and conservation. Projections of future energy consumption are much lower than previous forecasts. On the supply side, oil and gas drilling is up sharply and additions to reserves are increasing. Coal output is rising and oil imports have declined. Crude oil production from Prudhoe Bay in Alaska is over 1.6 million barrels per day; the Alaska Gas Pipeline project is under way; and imported LNG is expected to provide an increasing increment of gas supply, provided contractual and environmental problems can be resolved. Creation of the Synthetic Fuels Corporation will provide a major impetus to synthetic fuels development and a large, broadly-based energy research, development and demonstration program is beginning to provide new energy options.

31139 (EFN—10) **Energy forecasts, perspectives and methods.** Svensson, J.E.; Mogren, A. (Energiforskningsnaemnden, Stockholm (Sweden)). 1984. 198p. (In Swedish). NTIS (US Sales Only), PC A09/MF A01. File Number DE85750835.

The authors have analyzed different methods for long term energy prognoses, in particular energy consumption forecasts. Energy supply and price prognoses are also treated, but in a less detailed manner. After defining and discussing the various methods/models used in forecasts, a generalized discussion of the influence on the prognoses from the perspectives (background factors, world view, norms, ideology) of the prognosis makers is given. Some basic formal demands that should be asked from any rational forecast are formulated and discussed. The authors conclude that different forecasting methodologies are supplementing each other. There is no best method, forecasts should be accepted as views of the future from differing perspectives. The primary prognostic problem is to show the possible futures, selecting the wanted future is a question of political process.

31140 (ERG-MR—2e) **Energy demand patterns.** Hoffmann, L.; Schipper, L.; Meyers, S.; Sathaye, J.; Hara, Y. (Energy Research Group, Ottawa (Canada)). May 1984. 55p. Energy Research Group, P.O. Box 8500, Ottawa K1G 3H9, Canada. File Number TI85901445.

This report brings together three papers on energy demand presented at the Energy Research Priorities Seminar held in Ottawa on 8-10 August 1983. The first paper suggests a framework in which energy demand studies may be organized if they are to be useful in policy-making. Disaggregation and the analysis of the chain of energy transformations are possible paths toward more stable and reliable parameters. The second paper points to another factor that leads to instability in sectoral parameters, namely a changeover from one technology to another; insofar as technologies producing a product (or service) vary in their energy intensity, a technological shift will also change the energy intensity of the product. Rapid technological change is characteristic of some sectors in developing countries, and may well account for the high aggregate GDP-elasticities of energy consumption observed. The third paper begins with estimates of these elasticities, which were greater than one for all the member countries of the Asian Development Bank in 1961-78. The high elasticities, together with extreme oil dependence, made them vulnerable to the drastic rise in the oil price after 1973. The author distinguishes three diverging patterns of national experience. The oil-surplus countries naturally gained from the rise in the oil price. Among oil-deficit countries, the newly industrialized countries expanded their exports so rapidly that the oil crisis no longer worried them. For the rest, balance of payments adjustments became a prime concern of policy. Whether they dealt with the oil bill by borrowing, by import substitution, or by demand restraint, the impact of energy on their growth was unmistakable. The paper also shows why energy-demand studies, and energy studies in general, deserve to be taken seriously. 16 refs., 4 figs., 18 tabs.

31141 (NP—5750860) **Energy systems. Domestic energy sources of the province of Kronoberg.** (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). [1985]. 94p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. File Number DE85750860.

In cooperation with the local authorities in Kronobergs administrative province.

The location, size and availability of energy sources of the province of Kronoberg and its energy demandand future energy systems by the year 1990 and 2000 are presented. The resources include peat, wood and waste. The total area for peat mining is calculated to be 16200 ha, equivalent to 6000 GWh, 6.5 percent of it will be exploited by the year 2000. Some export of domestic fuels from Kronoberg is expected and the refining of fuels will be established.

31142 (RAND/N—2295-DOE) **International energy emergency system: issues and sources.** Kohler, D.F.; Trautman, W.B.; Doyle, M.A. (RAND Corp., Santa Monica, CA (USA)). May 1985. Contract AC01-82EP12128. 119p. NTIS, PC A06/MF A01; GPO Dep. File Number DE85013273.

This Note serves two functions. First, it provides a brief discussion of some of the issues surrounding the role of prices in an international energy emergency, and the way in which the International Energy Agency approaches them. Second, it offers summaries of some of the literature dealing with the International Energy Agency, and the ways in which it plans to influence oil markets and prices in the event of an energy emergency.

31143 (SOU—1983:19-Abst.) **Great transition. An analysis of international energy markets.** (Statens Energiverk, Stockholm (Sweden)). 1983. 72p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85750831.

In the beginning of 1981, the Swedish Government appointed Carl Tham, former Minister of Energy and currently Director of National Energy Administration, to explore the development of the international energy markets, with special reference to the impact on conditions for Swedish energy supply. Assisted by a sectretariat - Johan Lind, Olle Bjoerk and Maarten Grunditz - and an export committee, Carl Tham conducted the analysis during a turbulent period of the world oil market history, characterized by declining oil prices and revised energy projections. Working in a political and intellectual climate where the conventional wisdom of the recent past occasionally seemed to be very quickly outdated, the investigation was completed in the winter of 1982-83. The final report - written in Swedish and endtitled The Great Transition - an analysis of international energy markets, - was published in the spring of 1983. The analysis undertaken by Carl Tham and his secreteriat benefitted considerably from extensive communications and discussions with government officials, international organizations, business executives, academic scholars and other specialists. In order to provide all of these people - as an expression of deep appreciation of their assistance - as well as others not familiar with the Swedish language with an opportunity to evaluate the main conclusions reached as a result of the analysis this summary in English is published by the National Energy Administation and presents an overview of the contents of the unabridged report. One chapter (chapter 18), which summarizes Carl Thams own conclusions as to the current and future development of the International oil market, is, however, translated in full.

31144 (CONF-8410179—, pp 247-253) **Geothermal development in an era of excess capacity.** Grew, P.C. (California Public Utilities Commission, San Francisco). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

The purchase by utilities of power produced by non-utility companies such as several of the geothermal energy firms is discussed in detail. The role of regulatory bodies in the process is examined and the difficulties presented by the current excess capacity are described.

31145 (CONF-8410179—, pp 255-258) **Geothermal Program Review: luncheon speech.** Collins, P. (Dept. of Energy, Washington, DC). 1984. NTIS, PC A16/MF A01. File Number DE85008202.

From DOE geothermal technology conference; El Centro, CA, USA (16 Oct 1984).

Our national energy policy, how renewable energy fits into it, and the key role that geothermal energy can play in achieving the national energy goals were the topics of this luncheon address.

31146 **(DOE/IR/10334—T1) Series of conferences of state and local government officials.** (Littlejohn (Roy) Associates, Inc., Washington, DC (USA)). [1982]. Contract FG01-80IR10334. 256p. NTIS, PC A12/MF A01; 1; GPO Dep. File Number DE85012411.

The basis for analyzing this study was a survey that solicited information from public officals located in the 50 states and territories subject to US jurisdictions. A communique was sent to these individuals requesting responses to eight major areas. These public officials were also asked to provide information that focused upon conservation incentives, energy programs and energy legislation. Information requested from the participants was as follows: Executive branch energy pronouncements and policy statements; energy legislation; building codes, zoning ordinances and other administrative regulations dealing with energy; non-federal energy management programs; unilateral energy initiatives, i.e., undertaken without specific federal program direction and funding; publications and documents; other examples of unique methods of addressing energy challenges and opportunities; and energy policy positions formally adopted by organizations representing state, local and Indian governments.

31147 **(NP—5770297) Cuba - energy situation 1983.** (Bundesstelle fuer Aussenhandelsinformation, Koeln (Germany, F.R.)). Feb 1985. 11p. (In German). NTIS (US Sales Only), PC A02/MF A01. File Number DE85770297.

The energy situation of Cuba is reviewed on the basis of relevant data. Some remarks on the country's national and international energy policy are followed by an outline of trends in petroleum consumption and electric power generation. Important figures are presented on external trade and the balance of payments.

31148 **(NP—5770298) India - energy situation 1983/1984.** (Bundesstelle fuer Aussenhandelsinformation, Koeln (Germany, F.R.)). Feb 1985. 20p. (In German). NTIS (US Sales Only), PC A02/MF A01. File Number DE85770298.

The energy situation of India is reviewed on the basis of relevant data. Some remarks on the country's national energy policy are followed by an outline of trends in energy sources and electric power generation. Important figures are presented on external trade and the balance of payments.

31149 **(NP—5770299) Austria - energy situation 1983.** (Bundesstelle fuer Aussenhandelsinformation, Koeln (Germany, F.R.)). Mar 1985. 25p. (In German). NTIS (US Sales Only), PC A02/MF A01. File Number DE85770299.

The energy situation of Austria is reviewed on the basis of relevant data. Some remarks on the country's national and international energy policy are followed by an outline of trends in energy sources and electric power generation. Important figures are presented on external trade and the balance of payments.

31150 **More ado about prehearing discovery at FERC.** Benkin, I.D. (Federal Energy Regulatory Commission, Washington, DC). *Energy Law Journal;* 6: No. 1, 1-31(1985).

A rich tradition of prehearing discovery has grown up at the Federal Energy Regulatory Commission (FERC) despite the absence of procedural rules. Proposed discovery rules generally run in the mainstream, but the author also discusses some aspects of discovery practice at FERC that are not codified or proposed to be codified. A recent decision of the Ninth Circuit Court of Appeals clarified the legal status of the FERC's discovery rules. In Pacific Gas and Electric Co. vs. FERC, the court held that the agency is not required to provide for discovery. It also stated that if the agency's rules do contain provisions for discovery, those rules become binding and the agency must comport with due process. The author describes the effort to codify rules as a healthy development that demonstrates FERC's commitment to the adjudicative process for deciding important issues.

31151 **(CONF-850444—3) Applying multidisciplinary policy analysis to factors affecting coal use.** Surles, T.; Streets, D.G.; Tisue, M. (Argonne National Lab., IL (USA)). 1985. Contract W-31-109-ENG-38. 30p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012123.

From Newer coal technologies: implications for energy and development policies in Asia and the Pacific; Honolulu, HI, USA (17 Apr 1985).

The use of multidisciplinary analysis techniques in policy analysis is described. Integrated assessments are also used by countries to integrate the results of studies in various areas surrounding energy use. The discussion addresses development of coal resources and increased coal use. Multidisciplinary analysis includes environmental, industrial, and technology assessments. A case study on acid precipitation is presented since it is of grave concern in North America. The environmental limitations on coal use will require multidisciplinary policy analysis to evaluate the technological changes and to assess economic and environmental trade-offs. 7 refs., 11 figs., 1 tab. (DMC)

31152 **(DOE/CS/60038—11) Indiana energy facts.** (Indiana Dept. of Commerce, Indianapolis (USA). Div. of Energy Policy). [1985]. Contract FG02-76CS60038. 33p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85011991.

This document contains data on energy production, consumption, and prices in Indiana from 1960 to 1982. Prime energy supplies investigated are electric power, petroleum, coal and natural gas. No text is included. 2 figs., 26 tabs.

31153 **(DOE/EI/19685—T1) State heating oil program: final report. Survey of No. 2 heating oil prices and inventories at the retail and wholesale levels, October 1, 1984-May 1, 1985.** (Vermont State Energy Office, Montpelier (USA)). 1985. Contract FG01-84EI19685. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85013246.

Results of a survey of residential heating oil prices and inventories in Vermont are reported. Price and inventory of No. 2 distillate fuels were monitored at the retail and wholesale levels on a monthly, weekly or bi-weekly basis from October 1, 1984 through May 1, 1985. The survey data were collected via telephone calls to a sample of fuel oil suppliers throughout the state. The sample selection was completed by the Energy Information Administration (EIA), who also weighed and analyzed the collected data.

31154 **(ERG-MR—1e) Oil prospect.** Ion, D.C.; Odell, P.R.; Mossavar-Rahmani, B. (Energy Research Group, Ottawa (Canada)). Mar 1984. 57p. Energy Research Group, P.O. Box 8500, Ottawa K1G 3H9, Canada. File Number TI85901446.

Three papers presented at the Energy Research Priorities Seminar held in Ottawa on August 8, 1983 are included in this report. All address the prospects of oil. In the first paper, the best available estimates of oil and gas reserves and output in developing countries are summarized. Forecasts on prices and demand are included. The second paper addresses the nature and implications of the oil crisis for developing countries. Both papers conclude that oil prices are determined by collusion between the major producing and consuming countries. Prices are fixed high so that ultimate demand will fall short of the ultimate reserve. The third paper discusses prospects for OPEC oil in the 1980's. It concludes that the world oil market is fragmented, and what is regarded as the world price of oil is only the price of the small proportion of oil exported by OPEC countries. Major consuming countries give preference first to indigenous oil and then to oil from safe sources - which the OPEC countries are not, in their view. Hence the demand for OPEC oil varies more violently than total demand and so does the price of their oil. 26 refs., 14 figs., 15 tabs. (DMC)

31155 **(VTT-TUTK—279) Present exploitation technology and research needs of domestic fuels.** Mutanen, K.; Sahrman, K. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). May 1984. 134p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo (Finland).

The aim of the study was to survey energy research related to domestic fuels carried out during the time period 1979-1982 and the need for research and development of technology over the next three to four years. Since the late 70's 80 million Finnish marks have been directed to the research of domestic fuels from public funds. All sections of the domestic fuels operation chain can be supplied with commercial equipment. However, the domestic fuels are not competitive economically in all sectors of business. There is need to develop equipment, methods and entire systems. (In Finnish)

2950 Hydrogen And Synthetic Fuels

31156 **(NP—5901712) Ethanol policy issues facing Iowa and the midwest.** (Iowa Energy Policy Council, Des Moines (USA)). [1985]. 17p. NTIS, PC A02/MF A01. File Number DE85901712.

Changing state and federal government policies have produced an unstable market. The problem of imported ethanol and fragmented state policies can be solved by having states eliminate their tax incentives and have the federal government increase their incentive to at least 80 cents a gallon of ethanol and place a tariff on imports. The price of ethanol must reflect its octane value. Major refiners must be committed to use ethanol as an octane enhancer, and investments in terminal storage and blending equipment must be made. The 80 cents a gallon value is justified because the ethanol industry provides a stable market for agricultural products and protects the environment by replacing lead in gasoline. (DLC)

2960 Electric Power

REFER ALSO TO CITATION(S) 29736, 30244, 30660, 30661, 30662, 31118, 31134, 31136, 31152, 32125

31157 **(DOE/EIA—0226(85/02)) Electric Power Monthly, February 1985.** (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). May 1985. 45p. NTIS, PC A03/MF A01; 1 - GPO; GPO Dep. File Number DE85011764.

During February 1985, net generation by electric utilities in the United States was 198,121 gigawatthours (GWh). On a year-to-date basis, net generation at the end of February 1985 was 4.8% higher than for the same period in 1984. In February 1985, coal accounted for 56.5% of all electricity produced, petroleum for 4.7%, gas for 9.8%, hydroelectric power for 13.1%, nuclear power for 15.6%, with the remaining 0.4% from geothermal, wood, wind, and solar. In February 1985, electric utilities consumed 55,463 thousand short tons of coal. Petroleum consumption was 16,044 thousand barrels, while gas consumption was 201,160 million cubic feet. On a year-to-date basis, coal consumption at the end of February 1985 was 5.9% higher than that for the same period in 1984; petroleum consumption was 15.7% lower than during the same period in 1984; and gas consumption was 5.9% higher.

31158 **(DOE/EIA—0226(85/03)) Electric Power Monthly, March 1985.** (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Jun 1985. 44p. NTIS, PC A03/MF A01 - GPO; GPO Dep. File Number DE85013431.

During March 1985, net generation by electric utilities in the United States was 194,707 gigawatthours (GWh). On a year-to-date basis, net generation at the end of March 1985 was 2.4% higher than for the same period in 1984. In March 1985, coal accounted for 57.1% of all electricity produced, petroleum for 3.7%, gas for 10.2%, hydroelectric power for 12.6%, nuclear power for 15.9%, with the remaining 0.5% from geothermal, wood, wind, waste, and solar. In March 1985, electric utilities consumed 54,690 thousand short tons of coal. Petroleum consumption in March 1985 was 12,294 thousand barrels, while gas consumption was 206,247 million cubic feet. On a year-to-date basis, coal consumption at the end of March 1985 was 4.1% higher than that for the same period in 1984; petroleum consumption was 20.7% lower than during the same period in 1984; and gas consumption was 3.9% higher.

31159 **(DOE/IE—0003/1) Electric power supply and demand for the contiguous United States, 1985-1994. Staff report.** (USDOE Assistant Secretary for International Affairs and Energy Emergencies, Washington, DC). May 1985. 193p. NTIS, PC A09/MF A01; 1; GPO Dep. File Number DE85013410.

This report reviews the bulk electric power supply and demand situation projected by the electric utility industry for the contiguous US in the decade 1985 to 1994. The review is based primarily on the April 1, 1985 Regional Reliability Council Coordinated Bulk Power Supply Program Reports (IE-411 reports) submitted to the Department of Energy by each of the nine Regional Electric Reliability Councils. Other sources of information have also been used. The first map in Appendix 1 shows the geographic areas covered by each council. Six Council areas are subdivided into a total of 23 Regions to give a better understanding of the power supply situation. Three Council areas (ERCOT, MAAC and MAPP) are each considered as a single Electrical Region. Including the three councils considered as Regions, there are 26 Electric Regions discussed in this report. These Regions are shown on the second map in Appendix 1. Appendix 3 lists the utilities in each Region for which data are included in this report. Brief discussions are provided for each Council and each Region, with tabulated data providing the quantitative basis for the analyses. 63 tabs.

31160 **(DOE/NBM—5009058) Operating and financial profile report of the electric utility industry in the United States.** (Federal Energy Regulatory Commission, Washington, DC (USA). Office of Electric Power Regulation). Apr 1985. 51p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85009058.

In accordance with Order No. 389, Generic Rate of Return on Common Equity for Electric Utilities, 49 Fed. Reg. 29,946 (July 25, 1984), this profile report was written and describes the financial and operating circumstances of the electric utility. The information contained in this report provides the kind of data necessary to analyze industry trends and determine whether a company is significantly more or less risky than the electric utility industry average, if litigation ensues on that issue in an individual rate case.

31161 **(DOE/RA/50223—T1) Research on uncertainty for industry functional modelling. Final report.** Fine, T.L.; Thorp, J.S. (Cornell Univ., Ithaca, NY (USA). School of Electrical Engineering). Apr 1985. Contract AC01-80RA50223. 24p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011239.

Thrust has been to develop those new concepts of probability that show promise of being able to model some of the significant sources of uncertainty encountered in a power system or electric utility operation that are not well-modeled by the usual concept of numerical probability as formalized by Kolmogorov. Examples of relevant sources of uncertainty that are not amenable to conventional probabilistic models include most variables encountered in long term forecasts and in modeling such natural phenomena as weather and the availability and distribution of fuel resources. Our research has primarily focussed on the relatively new and little explored concept of interval-valued or upper and lower probability (U/LP). The axiomatic structure of U/LP may be thought of as a pair of nonnegative numbers in the unit interval that simultaneously represent the tendency for an event in question (interval midpoint, say) to occur and our lack of knowledge concerning this tendency (interval width). We have contributed to the development of the theory associated with U/LP in such areas as the generation of useful and tractable specific models (e.g., analogues to specific probability models like the Gaussian), the calculus of the random quantities described by U/LP (e.g., sums of random variables), and attempted to develop better definitions of independence and conditioning (learning from experience). We have applied the concept of U/LP to the problem of aggregating group/expert opinion so as to better represent the state of knowledge of an electric utility planning group doing long range planning and forecasting. We believe that our research has been successful in this area in that we can formally represent both consensus and disagreement in the opinions of a group of experts whereas the approaches based upon the conventional notion of numerical probability cannot display disagreement.

31162 **(DOE/RG/10241—T1) Power plant performance in Massachusetts: analysis and recommendations.** (Massachusetts Dept. of Public Utilities, Boston (USA); Barry (Theodore) and Associates, Los Angeles, CA (USA)). Jul 1981. Contract FC01-79RG10241. 139p. NTIS, PC A07/MF A01; 1; GPO Dep. File Number DE85010815.

Activities were carried out in establishment of a Power Plant Productivity Program as part of the second year of the PURPA-related activities. The program established a productivity data base for generating units with a capacity of more than 60 MW. We employed a questionnaire to collect data on the following parameters: heat rate, operating availability, equivalent availability, capacity factor, output factor and forced outage rate. The verified data was statistically analyzed in order to review the productivity of generating units over a ten-year period (1970 to 1980) and to identify any trends. The analysis identified the following trends: Heat rates have increased throughout the period for each company and on a statewide basis. Operating availabilities, equivalent availabilities, capacity factors, and output factors remained relatively constant or declined during the period. Forced outage rates trended upward during the period. Overall performance of fossil-fired units declined in the State of Massachusetts during the period from 1970 to 1980. Goals are established to arrest declining productivity and establish a starting point for improving performance.

31163 **(DOE/RG/10406—T4) End-use results for Public Utility District No. 1 of Chelan County.** (Economic and Engineering Services, Inc., Bellevue, WA (USA)). Mar 1982. Contract FG01-80RG10406. 78p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE85012435.

This is the final documentation for the end-use econometric analysis prepared for Chelan County PUD, Washington. Objective was to develop a statistical procedure for constructing current and future end-use forecasting models. Data analysis was conducted in steps: elimination of data inconsistencies, generation of correlation matrix and regressions relating kWh consumption and end-use variables, and derivation of a final end-use model. (DLC)

31164 **(DOE/RG/10406—T5) Chelan County Pud formal educational services, Topic B.3 - project valuation techniques; Topic B.4 - optimum electric pricing.** (Economic and Engineering Services, Inc., Bellevue, WA (USA)). 5 Nov 1981. Contract FG01-80RG10406. 102p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE85012436.

This document contains notes on: pricing, optimality, linear programming, present value issues, loss of load probability, inverse elasticity, avoided costs, marginal costing, and proposed voluntary guideline on the PURPA cost of service standard. (DLC)

31165 **(DOE/RG/10406—T6) Documentation manual for automated cost of service: Public Utility District No. 1 of Chelan County.** (Economic and Engineering Services, Inc., Bellevue, WA (USA)). Aug 1982. Contract FG01-80RG10406. 140p. NTIS, PC A07/MF A01; GPO Dep. File Number DE85012437.

Three basic cost of service programs were evaluated; the New York Department of Public Service program was found to meet or exceed all standards. A manual computation of the District's revenues and expenses for a period of one year was conducted. The automated average embedded computer model is discussed. Programs required to perform marginal cost of service calculations are documented. (DLC)

31166 **(DOE/RG/10406—T7) Documentation of forecasting models for Chelan County PUD No. 1.** (Economic and Engineering Services, Inc., Bellevue, WA (USA)). Nov 1982. Contract FG01-80RG10406. 161p. NTIS, PC A08/MF A01; 1; GPO Dep. File Number DE85012438.

This is a report on the estimation of the forecasting equations for the residential, commercial and industrial sectors of the Chelan County PUD No. 1 (District). This report also explores the use of univariate time series techniques (Box-Jenkins) for the forecasting of hourly system peak loads. The report presents the methodology to estimate new forecasting equations, but develops no actual forecasts. Heating and cooling degree days have been included to capture the seasonality inherent in electrical consumption.

31167 **(DOE/RG/10406—T9) Chelan County PUD No. 1 formal education services: topics B.7 and B.8.** (Economic and Engineering Services, Inc., Bellevue, WA (USA)). 17 Dec 1981. Contract FG01-80RG10406. 157p. NTIS, PC A08/MF A01; 1; GPO Dep. File Number DE85012439.

This document includes notes on: rate of return for public utilities, wheeling rates, cogeneration, avoided cost of power, and management information systems.

31168 **(EPRI-EA—3934) Customer response to load management: a survey and analysis of utility studies. Final report.** Lawrence, A.G.; Baumgartner, R.M. (Angel Economic Reports, Cupertino, CA (USA); Heberlein-Baumgartner Research Services, Madison, WI (USA)). May 1985. 236p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920633.

Utility impacts from load management show great similarity if progam and demographic differences are taken into account. Data from 42 programs featuring direct load control or time-of-use rates offer utility analysis a basis for estimating load response to future efforts.

31169 **(EPRI-EA—3994) Sample design for load research: current practice and methods.** McCarthy, P.M.; Harris, L.R.; Kumar, B. (Applied Management Sciences, Inc., Silver Spring, MD (USA)). Apr 1985. 155p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI85920591.

Designing surveys that will give utilities accurate profiles of customer demand is difficult but new techniques are rapidly being developed to meet the challenge. This document reviews and summarizes the state of the art in selecting samples for study, focusing on how to deal with practical design problems.

31170 **(LUTMDN/TMVK—1006-1-32-(1983)) Electric load in single family houses. Load analysis and simulation studies for local mains.** Larsson, L. (Tekniska Hoegskolan, Lund (Sweden). Institutionen foer Vaerme- och Kraftteknik). Apr 1983. 157p. (In Swedish). NTIS (US Sales Only), PC A09/MF A01. File Number DE85750846.

This thesis deals with the study of electric loads in single family houses, presented as a composite dissertation with four major reports and a summary. The study is based upon data from a measurement project carried out in 1977 by the Energy Supply Board in Gothenburg. For each of 40 single family houses three load components were measured as average values for each quarter of an hour: 1) Electric load for water heating. 2) Electric space heating load. 3) Load of household appliances, lighting, etc. The analysis of data concerned the characteristics features of the long term average load, the average daily load, the maximum daily load, and the daily load curve. A computer simulation model was developed and proved to be well suited for simulations of the aggregate load from a group of single family houses with direct resistive electric heating, provided that the outdoor temperature is fairly constant. Load dimensioning recommendations for the local mains are discussed. The results from the study are also interpreted in the context of the contemporary Swedish energy policy.

31171 **(ORNL/TM—9509) Regulation, pricing, and comparative performance in the US electric utility industry by ownership type.** Hill, L.J.; Tepel, R.C. (Oak Ridge National Lab., TN (USA)). May 1985. Contract AC05-84OR21400. 155p. NTIS, PC A08/MF A01. File Number DE85012077.

Purpose of this report is to assess issues that differentiate investor-owned electric utilities and publicly owned electric utilities in the context of providing recommendations for modeling the US electric utility industry on the basis of ownership type. Four ownership types were included for evaluation: (1) investor-owned electric utilities; (2) state/municipal electric systems (which include municipally owned electric utilities, state and county projects, public utility districts, and joint action agencies); (3) rural electric cooperatives; and (4) federal power projects. Defining the publicly owned segment as the latter three ownership types, the basis of modeling recommendations was an evaluation of the regulation, pricing, associated financial/economic issues, and comparative performance of publicly and privately owned electric systems. The associated financial/economic issues include taxation, depreciation policy, sources of capital, capital structure, and the treatment of Construction Work in Progress. Performance by the four ownership types was compared over the 1979-1981 period. Areas of comparison include cost of capital, financial indicators, and operating results on a percentage of revenues and unit sales basis.

2980 Consumption And Utilization

31172 **(DOE/EIA—0035(85/02)) Monthly Energy Review, February 1985.** (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). May 1985. 126p. NTIS, PC A07/MF A01 - GPO; GPO Dep. File Number DE85012342.

Current data on US production, consumption stocks, imports, exports, and prices of principal energy commodities are reported for each month of 1983 through the most recent month of 1985, and for each year from 1973 through 1984. Quarterly summaries for the current year are also provided. Energy sources covered are crude oil, petroleum products, natural gas, coal, nuclear power, and electric utilities. Also reported are energy consumption by sector, selected energy indicators, and oil and gas resource development. For selected other countries in the world, production, consumption, and stocks of petroleum and electricity generation by nuclear power plants are presented. Conversion factors and a glossary are provided.

31173 **(DOE/EIA—0214(83)) State Energy Data Report: consumption estimates, 1960-1983.** (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). 23 May 1985. 688p. NTIS, PC A99/MF A01; 1 - GPO; GPO Dep. File Number DE85013310.

Estimates of US annual energy consumption are presented for each year from 1960 through 1983. Data are reported for the United States, each Census division, and each of the 50 States by major end-use sector and by principal energy type. Sectors are residential, commercial, industrial, transportation, and electric utilities. Energy types are coal, natural gas, petroleum, petroleum products, nuclear power, hydroelectric power, geothermal power, and wood/waste. Also included are: technical documentation describing how the estimates were made for each energy source, sources of all input data, and a summary of changes from the previous year's report.

31174 **(DOE/EIA—0214(83)S) State Energy Data Report Supplement: consumption estimates, 1960-1983.** (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). 23 May 1985. 96p. NTIS, PC A05/MF A01; 1 - GPO; GPO Dep. File Number DE85013047.

Estimated US and State energy consumption is presented for each year from 1960 through 1983. Summarized from the primary volume of this report are: energy consumption, per capita energy consumption, consumption by type (coal, natural gas, petroleum, nuclear power, and hydroelectric power), consumption by major end-use sector (residential, commercial, industrial, transportation, and electric utilities), and yearly changes in consumption. Complete technical documentation of the estimates is provided in the primary volume: "State Energy Data Report Consumption Estimates, 1960-1982" (DOE/EIA—0214(83)). 13 figs., 64 tabs.

31175 **(DOE/MI/10004—T1) Comparative effects of high energy cost on black and white families at four economic income levels.** Crumbly, I.J. (Fort Valley State Coll., GA (USA)). Dec 1983. Contract FG05-82MI10004. 94p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85012544.

For both black and white families in Peach County and Fort Valley, Georgia, electrical energy consumption increased as the family income increased. White families consumed 23% more electrical energy than black families at the $23,500 income level. At the lowest income ($4500) level, black families consumed 55% more electrical energy than white families. Black families also used 5% more electrical energy than white families at both the $9,000 and $16,000 income levels. More electrical energy was consumed during the summer months than during the winter months. The greater consumption of electrical energy during the summer is associated with air conditioning. Although both black and white families consumed the greatest amount of gas energy at the highest income level, gas consumption was not as closely correlated with increase in income levels as electrical energy. For both black and white families, gas energy consumption was several times greater during the winter than during the summer months. In regards to the total cost of energy among black households, the $9000, $16,000 and $23,500 income levels spent 2%, 23% and 35% more money for the total cost of energy than the $4500 income level. Similarly, white households at the $9000, $16,000 and $23,500 income levels spent 33%, 30% and 101% more money for the total cost of energy, respectively, than the $4500 income level. One dollar out of every 6.4 dollars (or 15.6% of total income) was spent on energy at the $4500 income level in black households compared to one out of every 8.3 dollars (12.1% of total income) spent on energy at the same income level for white households. The lowest percentage of income spent on energy by black households was 4% at the $23,500 income level. For white families, the lowest percentage of income spent on energy was 4.4% at the $16,000 income level.

31176 **(NP—5770300) Thailand - energy situation 1983.** (Bundesstelle fuer Aussenhandelsinformation, Koeln (Germany, F.R.)). Mar 1985. 24p. (In German). NTIS (US Sales Only), PC A02/MF A01. File Number DE85770300.

Thailand's present energy situation is described with special regard to petroleum, natural gas, brown coal and alternative energy sources. .The main section contains tables on energy consumption, production, imports and consumption of petroleum and petroleum products, and electric power generation and consumption.

2990 Unconventional Sources And Power Generation

31177 **(CONF-8504134—1) Macro modeling of energy from agriculture.** Turhollow, A. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 6p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011912.

From 26. Instrument Society of America modeling and simulation conference; Pittsburgh, PA, USA (25 Apr 1985).

Macro-level modeling of energy from agriculture has focused primarily on the production of ethanol from corn, with a few studies on the use of crop residues, oilseeds, and lignocellulosic crops. Both econometric simulation and mathematical programming models have been used. Some methods of improving these models are discussed. Research is now focusing on the use of lignocellulosic crops - agricultural and woody - and oilseeds dedicated to energy production. 19 refs., 2 tabs.

31178 **(DOE/ET/12016—4) Utah Geothermal Commercialization Project. Final report, April 1979-March 1985.** (Utah Div. of Water Rights, Salt Lake City (USA)). 1985. Contract FC07-79ID12016. 16p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85013311.

The Geothermal Commercialization Project is a cooperative program funded by the US Department of Energy and various individual states. Its purpose is to promote the utilization of geothermal energy through planning services, information dissemination, technical assistance, institutional analysis, and other support services. In Utah, the contracting agency is the Division of Water Rights of the Department of Natural Resources. The specific tasks which were performed in the course of the project included the identification and tabulation of known and potential resource sites; planning at the site-specific and regional levels; the analysis of institutional factors affecting the rate of progress of geothermal development; recommendations for improvement in state and federal regulatory procedures and policies; and continuous monitoring of geothermal activity in Utah. This report summarizes the results of these tasks and references the specific reports in which they can be found. The benefits of the project to the state are discussed, including the passage of state legislation dealing with the regulation of geothermal development in the state, and providing a source of information and assistance within the state for potential developers. Recommendations include additional legislation and continued support activity to facilitate the development of all types of geothermal resources in Utah.

31179 **(ERG-MR—3e) Renewable energy resources.** Lambert, Y.; Fall, D.; Isaza, J.F. (Energy Research Group, Ottawa (Canada)). Jul 1984. 54p. Energy Research Group, P.O. Box 8500, Ottawa K1G 3H9, Canada. File Number TI85901444.

This report contains 3 papers presented at the Energy Research Priorities Seminar held in Ottawa on August 8, 1983. The paper by Professor Lutz Hoffmann (Hoffmann 1984) outlined an approach to energy demand studies that involved the disaggregation of energy consumption to specific uses and the comparison of various technologies that could serve each use. Mr. Yves Lambert's paper is an application of this approach. It does not include the figures of consumption and costs that a Hoffmann-type study would require and to that extent it is difficult to test the validity of Lambert's conclusions. However, it is perhaps difficult to marshal such detailed data for West Africa. Professor Djibril Fall concentrates on some of the options, and reports on the work in progress in Senegal. Mr. Jose Fernando Isaza reports on the solar water heaters installed in Colombia. He stresses the extent of adaptive research and development (R and D) required, most of which was in system components other than the solar collectors. His paper perhaps carries a warning about over-specialization in energy research. Energy is an intermediate input, and improved energy technology will generally have to be fitted into products and equipment; some of it might, therefore, have better chances of success if it were undertaken by producers or institutions that do not narrowly specialize in energy. 3 refs., 10 figs., 14 tabs.

31180 **(ERG-MR—5e) Latin American research and development in the energy field: a review.** Torres, J.E. (Energy Research Group, Ottawa (Canada)). Aug 1984. 154p. Energy Research Group, Box 8500, Ottawa, Canada. File Number TI85901442.

This report is divided into six main sections. The first outlines the conceptual framework and methodology stressing the limitations that impede greater depth of analysis. The second, on the types and directions of research and development (R & D) activities in Latin America, is divided into three subsections, covering New and Renewable Sources of Energy (NRSE); conventional energy; and integrated energy resource R & D. In each subsection, the author endeavored to describe and critically assess R & D activities, achievements, and failures within the context of the limitations. Conclusions and recommendations in each case are implicitly or explicitly made depending on the field. In the third section, the state of science and technology (S-T) policy on energy resources is presented. The fifth section is a bibliography of 64 annotated and 52 unannotated items. Latin America as a whole has a solid R & D capability in the various energy fields, but with each country technically capable of intensifying efforts and obtaining results at least in a limited number of technologies. The human resource base as well as the physical infrastructure for intensified activity are either in place or readily within reach. Some countries, notably Argentina and Chile, may even have idle human and physical capacity for the level of activity they currently undertake. In general, the literature and interviews show that the potential contribution of R & D to the process of self-sustained development of Latin American society is large. Yet it is evident that the S-T systems of most countries have not responded in the past to the demands that the challenges of economic development and improvement of the quality of life of these societies impose upon them. It is evident that the primary cause has been twofold: the lack of articulation among the actors in the S-T system, and the dispersion of the few resources available.

31181 **(FRN-R—82-17) Renewable natural resources. A Swedish Research Programme for the Future.** Lundholm, B. (Swedish Council for Planning and Coordination of Research, Stockholm). 1982. 33p. NTIS (US Sales Only), PC A03/MF A01. File Number DE85750833.

The report deals with the use of renewable natural resources and its effects on the environment and society. The main task is to consider the role of research in handling the problems of the future. To a large extent, the report reflects the opinions of Swedish scienific community.

31182 **(DOE-tr—273-Vol.1, pp IC9.1-IC9.12) Effects of cathode slag polarization on magnetohydrodynamic generator performance.** Petty, S.W. (Avco Everett Research Laboratory, Inc., Everett, MA). 1983. Translation source information not available . NTIS, PC A19/MF A01.

From 8. international conference on MHD electrical power generation; Moscow, USSR (12 Sep 1983).

In Eighth International Conference on MHD Electrical Power Generation. Vol. 1.

A series of experiments was conducted on a slagging magnetohydrodynamic (MGD) generator to investigate the loss in channel performance brought about by slag polarization phenomena in which large reductions in slag resistivity are observed on the cathode wall. A one meter long channel with 56 electrode pairs and peg type insulator walls was driven by an ash-injected, oil-fired combustor operating at 14 megawatt thermal input. At nominal channel operating conditions of 40 to 50 kWe and a Hall voltage of 500 to 800 volts there was a degradation in performance of approximately 10 percent in power and 30 percent in Hall voltage when the cathode wall slag was fully polarized. For newly slagged channel walls, the time required was between 80 and 100 minutes. Measurements of polarized Rosebud cathode slag conductivity ranged from 140 to 370 milliohms per meter yielding an equivalent channel slag conductivity of 70 to 90 milliohms per meter. By contrast, tests in which the seed was discontinued resulted in relatively no change in generated Hall voltage (approximately or equal to 500 volts) while power levels dropped to less than 1 kilowatt, demonstrating minimal leakage in the slag layer. It is concluded that the cathode slag layer is not continuous but is periodically broken. Shorting of Faraday currents in the presence of a Hall field results in increasing current concentrations at the downstream edge of the shorted group until sufficient joule heating is produced to locally remove or thin the slag layer and create an open insulator gap capable of sustaining the Hall voltage. The net effect was a resegmentation of the cathode wall from a design pitch of 1.5 centimeters to a pitch of between 4 and 10 centimeters depending on the iron oxide concentration in the ash. 5 refs., 11 figs., 3 tabs.

31183 (**DOE-tr—273-Vol.1,** pp IB5.1-IB5.10) **Magnetohydrodynamic generator performance comparisons between coal and oil plus ash firing.** Enos, G.; Kessler, R.; Petty, S.; Swallom, D. From 8. international conference on MHD electrical power generation; Moscow, USSR (12 Sep 1983).

In Eighth International Conference on MHD Electrical Power Generation. Vol. 1.

A two stage slagging coal combustor developed by the Thomson Ramo Williams (TRW) Corporation, was successfully integrated with a magnetohydrodynamic (MGD) generator developed by the Avco Corporation, when the two companies cooperated in an operational demonstration of a coal fired magnetohydrodynamic power train under the sponsorship of the Department of Energy (DOE). The experimental components, rated at a nominal 20 megawatt thermal input, are the engineering prototypes of a 50 thermal megawatt hardware to be supplied by the contractors to the recently commissioned Component Development and Integration Facility (CDIF), a federal magnetohydrodynamic test site in Butte, Montana. A second series of tests was conducted in which the same channel and operating parameters were employed with an oil fired ash injected combustor (AIC) to provide performance comparisons. The primary objective was the validation of using an ash injected combustor for development of coal fired magnetohydrodynamic generators. The only significant performance variation uncovered in the comparison tests was attributable to a less than optimum method and location for seed injection in the coal fired combustor. The corrective measures are deemed to be relatively straightforward. 11 figs.

From 8. international conference on MHD electrical power generation; Moscow, USSR (12 Sep 1983).

In Eighth International Conference on MHD Electrical Power Generation. Vol. 1.

Coal fired magnetohydrodynamic (MGD) generators may be required to operate with molten slag flow on their walls. Experimental investigation has shown that the Hall voltage of the generator is sustained nonuniformly among the segments of the cathode wall. This is demonstrated by the step ladder pattern of the axial Hall voltage distribution among the generator cathodes, obtained from the operation of the AERL Mark Six Faraday generators under typical coal combustion environments. Groups of cathodes shorted by slag are bordered by high voltage gaps. No deleterious effects have been observed by such nonuniformities in a Faraday generator. However, they are found to cause severe spatial current fluctuations in the diagonal generator. This results in increased electrical stresses on a few electrodes which may ultimately lead to their early failure. Forced current sharing among electrodes, effected by current controllers, is of primary importance for the long duration operation of diagonal generators. In this paper the control of diagonally connected magnetohydrodynamic generators is investigated. Special circuits that were developed for this purpose are described. In addition to securing the uniformity of electrode current distribution in a slagging channel, these circuits decouple the electrode walls of the generator and eliminate the damage to the anode caused by cathode wall nonuniformities. The implication of current control circuits on a large scale magnetohydrodynamic generator is discussed next and the results of design studies and performance predictions are presented. Continuous window frame diagonal generators are not discussed because to date, no feasible methods of controlling current flows in the frames that are part of the channel structure exist. 2 refs., 9 figs., 3 tabs.

31185 (**DOE-tr—273-Vol.1,** pp ID10.1-ID10.9) **Analytical investigations of the effects of cathode nonuniformities on magnetohydrodynamic (MGD) generator characteristics.** Pian, C.C.P.; McClaine, A.W.; Sadovnik, I. (Avco Everett Research Laboratory, Inc., Everett, MA). 1983. Translation source information not available . NTIS, PC A19/MF A01. Contract AC22-80ET15614.

From 8. international conference on MHD electrical power generation; Moscow, USSR (12 Sep 1983).

In Eighth International Conference on MHD Electrical Power Generation. Vol. 1.

The effects of cathode wall nonuniformities caused by slag shorting on the internal electrical characteristics of Faraday loaded generators are investigated analytically. Two analytical models are utilized in the investigation: a three dimensional finite element electrical model and a two dimensional current stream function solver. The cathode nonuniformities are treated in these models as a coarser resegmentation of the cathode wall. These models are described and some results based on the models are presented. Model assumptions which are critical to obtaining proper results are identified. 13 refs., 11 figs.

31186 (**CONF-850311—14-Draft**) **Thermodynamics of the corrosion of chromium in molten carbonates.** Hsu, H.S.; DeVan, J.H. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 24p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85011407.

From National Association of Corrosion Engineers annual meeting and materials performance and corrosion show; Boston, MA, USA (25 Mar 1985).

To define and study the mechanisms that control the corrosion of current collector materials in molten carbonate fuel cells (MCFC), the corrosion of chromium in Li_2CO_3-K_2CO_3 has been investigated from a thermodynamic point of view. Thermochemical calculations with the SOLGASMIX-PV computer program were used to establish equilibrium phase relationships. This paper considers phase stability diagrams of Cr-Li_2CO_3, Cr-K_2CO_3, and Cr-$(Li,K)_2CO_3$ systems at 650°C. The condensed phases at equilibrium are mapped as functions of log a/sub O_2/ and log a/sub CO_2/ for the gas mixture O_2, CO_2, and Ar at 1.0 atm (1.01×10^5 Pa) total pressure; where a/sub O_2/ and a/sub CO_2/ are the activities (partial pressures) of O_2 and CO_2, respectively. In the system Cr-$(Li,K)_2CO_3$, a mixture of $(Li,K)_2CO_3$ and $(Li,K)_2CrO_4$ should exist under oxidizing environments when log a/sub O_2/ > -5.0 and log a/sub CO_2/ > -4.6, and a mixture $(Li,K)_2CO_3$ and $LiCrO_2$ is stable in reducing atmospheres when log a/sub O_2/ < -8.0 and log a/sub CO_2/ > -4.6. The concentration of $(Li,K)_2CrO_4$ is dependent on the concentration of $(Li,K)_2CO_3$. The ternary phase boundary of $(Li,K)_2CO_3$-$(Li,K)_2CrO_4$-$LiCrO_2$ varies when the concentration of $(Li,K)_2CO_3$ changes. These predicted phase relationships were checked experimentally by thermogravimetric analysis (TGA) and differential thermal analysis (DTA). The results of TGA and DTA were self-consistent with respect to the reaction products from the calculated phase stability diagrams. 14 refs., 8 figs., 2 tabs.

31187 (**N—85-16292**) **Engineering model system study for a regenerative fuel cell: study report.** Chang, B.J.; Schubert, F.H.; Kovach, A.J.; Wynveen, R.A. (Life Systems, Inc., Cleveland, OH (USA)). Sep 1984. 91p. (NASA-CR—174801). NTIS, PC A05/MF A01.

Key design issues of the regenerative fuel cell system concept were studied and a design definition of an alkaline electrolyte based engineering model system or low Earth orbit missions was completed. Definition of key design issues for a regenerative fuel cell system include gaseous reactant storage, shared heat exchangers and high pressure pumps. A power flow diagram for the 75 kW initial space station and the impact of different regenerative fuel cell modular sizes on the total 5 year to orbit weight and volume are determined. System characteristics, an isometric drawing, component sizes and mass and energy balances are determined for the 10 kW engineering model system. An open loop regenerative fuel cell concept is considered for integration of the energy storage system with the life support system of the space station. Technical problems and their solutions, pacing technologies and required developments and demonstrations for the regenerative fuel cell system are defined.

31188 (NP—5770191, pp 6.1-6.52) **Fuel cells and batteries in the future Danish energy system.** Jensen, J. (Odense Universitet, Denmark. Lab. for Energiforskning). Jan 1984. (In Danish). NTIS (US Sales Only), PC A16/MF A01. File Number DE85770191.

EFP-81.

In Technological development and its impact on the future energy system. Appendix 1. Evaluation commissioned by the Danish Ministry of Energy.

About year 2000 there can be expected solved some technical problems and fuel cells and batteries can be incorporated into the Danish power system. Probably first in 2030 the economic basis will be sound enough to develop large scale electrochemical storage- and conversion units.

31189 **Adsorption of trifluoromethanesulfonate anions at the mercury/electrolyte interface.** Gonzalez, E.R.; Srinivasan, S. (Los Alamos National Lab., NM). *Electrochimica Acta;* **27**: No. 10, 1425-1428(1982).

Recently, there has been much interest in the use of trifluoromethanesulfonic acid as an electrolyte in advanced fuel cell systems because of the enhanced rate of oxygen reduction in this medium. In order to elucidate this characteristic from a double layer point of view, the present work was undertaken to study the adsorption of trifluoromethanesulfonate ions on mercury electrodes. Differential capacities and potentials of zero charge were measured in constant ionic strength solutions at 25°C. Analysis of the results shows that the extent of specific adsorption of $CF_3SO_3^-$ anions is small, and the anions even desorb from the surface at sufficiently positive electrode charges. The structure of the inner layer is elucidated, and an isotherm for the adsorption of $CF_3SO_3^-$ based on electrostatic models of the double layer is derived. The results indicate that at the potentials for the electroreduction of oxygen $CF_3SO_3^-$ anions will not interfere with the adsorption of the reactant and of intermediates, allowing faster rates to be achieved.

32 ENERGY CONSERVATION, CONSUMPTION, AND UTILIZATION

31190 (CONF-8505146—1) **Intra-organizational environment of technological change: insights from the Navy's Energy Program.** Brown, M.A.; Jones, D.W. (Oak Ridge National Lab., TN (USA)). 1985. Contract AC05-84OR21400. 35p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85012902.

From Southern Regional Science Association meeting; Washington, DC, USA (9 May 1985).

In a case study of the adoption of energy-conserving technologies and behaviors at Naval shore facilities in the Southeastern United States, the internal organizational environment was found to exert as great an influence on investment decisions as market prices and apparent savings opportunities. This paper discusses relevant segments of the Navy's organizational environment and the behavior of decision makers within it. Results of site visits and a survey of decision makers at Naval shore facilities suggest that the most significant barrier to adoption of new energy-conserving technology is a shortage of personnel to install, operate, and maintain new equipment. This situation enforces energy use patterns which may appear excessive, but which may be appropriate choices when guided by conditions of local manpower scarcities combined with the ability to draw on additional funds to cover unpaid fuel bills. A contributing problem is that only a small proportion of energy consumption activities are metered and many existing meters go unread. The inability to identify excessive energy users and to verify energy savings inhibits effective modifications of behavioral patterns and the introduction of new equipment. We consider the implications of these findings for the technological change activities of other public and private organizations with multi-locational structures, in which internal "shadow markets" are important. 24 refs., 3 figs., 1 tab.

31191 (PNL—5462) **Project on Restaurant Energy Performance: end-use monitoring and analysis.** Claar, C.N.; Mazzucchi, R.P.; Heidell, J.A. (Pacific Northwest Labs., Richland, WA (USA)). May 1985. Contract AC06-76RL01830. 154p. NTIS, PC A08/MF A01; 1; GPO Dep. File Number DE85013167.

Although energy bills for restaurants throughout the United States exceed 5 billion dollars annually, very little has been documented with respect to when and how restaurants use energy, or how such use can be reduced cost-effectively. This report summarizes the results of a multiyear collaborative research effort, designed to collect information on end-use energy consumption. Objective is to reveal the quantities and profiles of energy consumption of typical food service operations by time of day and end use. This information, when examined in conjunction with building characteristics, allows detailed study of energy use cause and effect and energy conservation potential. Seven representative monitoring sites were selected, a computerized data acquisition network was designed and implemented, and detailed energy performance was compiled for a 1 year period (July 1983 through June 1984). Each of the seven facilities monitored was selected to represent the seven most common restaurant types and to provide information on a wide variety of commonly used restaurant equipment. Preliminary findings are presented.

31192 (AD-A—151707/7/XAB) **Automated building design review using BLAST (Building Loads Analysis and System Thermodynamics). Final report.** Amber, J.; Leverenz, D.J.; Herron, D.L. (Army Construction Engineering Research Lab., Champaign, IL (USA)). Jan 1985. 45p. (CERL-TR-E—85/03). NTIS, PC A03/MF A01.

Supersedes Rept. no. CERL-TR-E-190, AD-A134 487.

This document describes a method for using the Building Loads Analysis and System Thermodynamics (BLAST) energy-simulation computer program to review the energy effectiveness of the new Army facility designs. This review method covers both aspects of new Army's energy criteria: prescriptive energy standards and facility energy-design budgets. The method compares the energy-criteria with information contained in a BLAST output deck. This deck contains most of the information needed to review a new design for compliance with energy criteria. A special BLAST Design Review Summary Report was developed which provides, in an easy-to-read, standard format, the information needed to check a design for energy criteria compliance. A description of the prototype design review procedure was published in USA-CERL TR-E-190. The review procedure and the Review Summary Report were modified based on the results of field tests. The modifications, which are presented in this report, further enhance the procedure's utility by providing the user with more information about the building design, making the Review Summary Report more of a stand-alone document. This report describes how Army Corps of Engineers Districts can use the BLAST Review Summary Report to review the energy effectiveness of new facility designs submitted by architect/engineer firms who use BLAST.

31193 (AD-A—151708/5/XAB) **New control design principles based on measured performance and energy analysis of HVAC (heating, ventilating, and air-conditioning) systems. Interim report.** Hittle, D.C.; Johnson, D.L. (Army Construction Engineering Research Lab., Champaign, IL (USA)). Jan 1985. 46p. (CERL-IR-E—85/02). NTIS, PC A03/MF A01.

This report is one of a series on the development of heating, ventilating, and air-conditioning (HVAC) control systems that are simple, efficient, reliable, maintainable, and well-documented. This report identifies major problems associated with three currently used HVAC control systems. It also describes the development of a retrofit control system applicable to military buildings that will allow easy identification of component failures, facilitate repair, and minimize system failures. Evaluation of currently used controls showed that pneumatic temperature control equipment requires a very clean source of supply air and is also not very accurate. Pneumatic, rather than electronic, actuators should be used because they are cheaper and require less maintenance. Thermistor temperature detectors should not be used for HVAC applications because they require frequent calibration. It was found that enthalpy economy cycles cannot be used for control because the humidity sensors required for their use are prone to rapid drift, inaccurate, and hard to calibrate in the field. Performance of control systems greatly affects HVAC operating costs. Significant savings can be achieved if proportional-plus-integral control schemes are used. Use of the retrofit prototype control panel developed in this study on variable-air-volume systems should provide significant energy cost savings, improve comfort and reliability, and reduce maintenance costs.

31194 (ASHRAE/SP—28, pp 9-14) **Calculator programming technique for estimating thermally optimum wall construction.** Twenty, J.E.; McQueen, L.V. (Energy Management and Control Corp., Topeka, KS). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Models suitable for programmable calculators were developed for predicting building thermal envelope mechanical systems interactions and their affect on energy consumption. The models were based on the bin method. The models include single zone air conditioning systems, multizone and dual duct systems, variable air volume systems, and heat pump systems.

31195 (ASHRAE/SP—28, pp 33-51) **Simple methods for predicting thermal behavior and energy consumption in buildings.** Agnoletto, L.; Brunello, P.; Zecchin, R. (Universita di Padova, Italy). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Algorithms for the evaluation of energy needs for the heating and cooling of buildings are presented which are suitable for pocket and desk-top calculator use. The algorithms were developed from more complex models developed for computer use and give good agreement with those models.

31196 (ASHRAE/SP—28, pp 52-57) **Energy conservation design guidelines for including mass and insulation in building walls.** Dexter, M.E. (Syska and Hennessy, Inc., New York, NY). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

In the design of energy efficient buildings, it is necessary to optimize wall insulation and thermal mass. The benefits of insulation in light-weight walls are well understood. However, the effects of mass for energy conservation are grossly overestimated by many while being completely neglected by others. Insulation and mass can be combined in different ways to achieve different results as desired in heating, heating/cooling, and cooling climates. Special consideration must be given to internal loads and occupancy profiles (daytime only vs. 24 hour occupancy) and how the walls can help reduce building loads rather than impose building loads. Guidelines are presented here for applying mass and insulation for energy conserving wall design.

31197 (ASHRAE/SP—28, pp 85-93) **Use of sound to locate infiltration openings in buildings.** Keast, D.N.; Pei, H.S. (Bolt Beranek and Newman Inc., Cambridge, MA). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Sound waves pass readily through many of the same openings in building envelopes that allow air infiltration. This fact permits the location of such air-infiltration openings by acoustic means. The results of an experimental program, including laboratory tests of a specially constructed partition and field tests on eight buildings, are reported. On the average, openings that can be located acoustically transmit sound that is about twice as loud as that through adjacent, sealed locations. Laboratory studies indicate that the sound level increase through a leakage opening is roughly correlated with the logarithm of the local air flow rate when a steady differential pressure is established across the partition ($r = 0.67$). Leak location with sound can be done by semiskilled workers with low cost hi-fi shop equipment. The test procedure does not require pressure or temperature differentials across the building envelope.

31198 (ASHRAE/SP—28, pp 94-121) **Low pressure leakage function of a building.** Sherman, M.H.; Grimsrud, D.T.; Sonderegger, R.C. (Lawrence Berkeley Lab., CA). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A new technique for measuring low-pressure leakage of a building is presented, based on AC pressurization. In this technique the volume of the building is modulated with a given frequency using a cylinder and piston assembly sealed into a door or window. By contrast the conventional DC pressurization technique measures the flow necessary to keep a given steady state pressure difference across the envelope. By measuring the interior pressure response synchronously to the volume oscillation AC pressurization can eliminate the pressure fluctuations caused by the weather, that make DC measurements difficult in the low-pressure range. Many models have been devised to correlate air infiltration in buildings with weather parameters. A particularly promising strategy is to predict the air flow through the building envelope from surface pressures, which in turn are predicted from measured weather parameters. Due to weather induced noise, it is difficult to measure the pressure-flow relationship in a manner that is valid for the low surface pressures which have been observed to drive infiltration. Conventional techniques rely on steady-state (DC) fan pressurization or depressurization of the structure. DC-measurements are unreliable at pressures less than 5-10 Pa, yet this is the pressure range that often drives natural infiltration. This paper reports measurements of the leakage function measured at low-pressures using an alternating (AC) pressure source with variable frequency and displacement. Synchronous detection of the indoor pressure signal created by the source eliminates the noise due to fluctuations caused by the wind. Comparisons are presented between these results and extrapolations of direct fan leakage measurements.

31199 (ASHRAE/SP—28, pp 221-236) **Laboratory tests of thermal performance of exterior walls.** Fiorato, A.E. (Construction Technology Labs., Skokie, IL). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

The Construction Technology Laboratories calibrated hot box test facility to evaluate steady-state and dynamic thermal performance of wall assemblies is described. This facility consists of two highly insulated environmental chambers that enclose the test wall. Nominal overall dimensions of the test wall are 103 x 103 in. (2.62 x 2.62 m). Wall thicknesses can be varied. The facility was designed to accommodate test walls with thermal resistance values ranging from 1.5 to 20 hr x ft^2 x F/Btu (0.26 to 3.52 k x m^2/W). One of the insulated chambers simulates an indoor environment and is maintained at a constant room temperature between 65 and 80 F (18 and 27 C). The other chamber simulates an outdoor environment where temperatures are held constant or cycled between -20 and 120 F (-29 and 49 C). Instrumentation is provided to monitor air and surface temperatures on each side of the test wall, and energy required to maintain constant indoor temperature. Examples of steady-state and dynamic test procedures and results are given. Steady-state tests are used to obtain heat transmission coefficients such as thermal conductance (C) and resistance (R). Dynamic tests provide quantitative data on thermal response that include effects of thermal storage capacity as well as thermal resistance of wall assemblies.

31200 (ASHRAE/SP—28, pp 237-249) **Calibration procedures and results for a large calibrated hot box.** Rucker, J.L.; Mumaw, J.R. (Owens-Corning Fiberglass, Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

This paper describes the evolution of the Owens-Corning Fiberglas Large Scale Horizontal Calibrated Hot Box known as the Thermal Research Facility described previously at the joint DOE/ASTM Insulation Conference in Tampa, Florida, 1978. The facility was constructed for experimental measurements of thermal performance of large composite horizontal building elements, as well as total building envelopes such as a one-room structure or a mobile home. This discussion summarizes the original design concepts, reviews the limitations involved with these concepts, and details the final hot box configuration. The discussion includes a detailed analysis of the limitations, with regard to power measurements and stabilization and the solutions incorporated into the final design to overcome these operational limitations. The total conditioning and measurements systems including the heating and cooling systems, the instrumentation, power measurements equipment, and data acquisition and analysis systems involved with the facility in its final design are described. The comprehensive calibration test program and the summary of results obtained are presented. The physical significance of the experimental results are explained by comparison to the mathematical model of the overall system. Details of the calibration sample used in the program are discussed also. The paper concludes with recommendations for calibration procedures for future facilities of this type.

31201 (ASHRAE/SP—28, pp 269-282) **Thermal insulation laboratory accreditation program.** Bryson, J.O. (National Bureau of Standards, Washington, DC). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Laboratory accreditation has emerged because US commerce has a strong interest in ensuring that laboratory test results are accurate, useful, and obtained in an efficient manner. Criteria for accrediting laboratories that test thermal insulation materials were published in the Federal Register on January 28, 1979. Inspection and evaluation procedures have been carried out in thirty testing laboratories which constitute the first group evaluated for accreditation under the National Voluntary Laboratory Accreditation Program (NVLAP). NVLAP is a system developed within the Department of Commerce in cooperation with the private sector to examine, upon request, the professional and technical competence of private public testing laboratories. The program is intended to accredit laboratories that meet certain general and specific criteria germane to their technological testing service. An ov,erview of the accreditation process and the experience gained in evaluating the laboratories is presented.

31202 (ASHRAE/SP—28, pp 283-298) **Thermal parameters as a function of thickness for combined radiation and conduction heat transfer in low-density insulation.** Rennex, B.G. (National Bureau of Standards, Washington, DC). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Approximate expressions are obtained for the apparent thermal conductivity and thermal resistance, in the case of combined conductive and radiative heat transfer through low-density insulation. These expressions are obtained in the regimes of intermediate and large optical depth, and they depend on only two parameters to be determined by experiment, namely the conduction thermal conductivity, k/sub c/, and the extinction coefficient, β. An expression is obtained for the apparent thermal resistance of an insulation consisting of layers with distinct densities. The applicability of these expressions to the interpretation of experimental results and to the improvement of ASTM Test Methods is discussed.

31203 (ASHRAE/SP—28, pp 299-307) **Design and construction of a calibrated/guarded hot box facility.** Perrine, E.L.; Linehan, P.W.; Howanski, J.W.; Shu, L.S. (Wiss, Janney, Elstner and Associates, Northbrook, IL). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A complete Calibrated/Guarded Hot Box test facility was fabricated by Wiss, Janney, Elstner and Associates for the Construction Products Division of W.R. Grace & Company. The facility essentially consists of two environmental chambers, one calibrated chamber, one metering chamber, a control and data acquisition system including a HP9835-A mini-computer, a drying oven, a preconditioning chamber, insulated test frames and a pneumatic transport system. The facility allows specimens to be tested horizontally or vertically, under steady state or dynamic temperature conditions. Design specifications are presented.

31204 (ASHRAE/SP—28, pp 308-324) **Design of a calibrated hot-box for measuring the heat, air, and moisture transfer of composite building walls.** Achenbach, P.R. (National Bureau of Standards, Washington, DC). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A large calibrated hot-box is to be constructed at the National Bureau of Standards to support the development of standard procedures for measuring the heat, air and moisture transfer of room-size (3.0 by 4.5 m) exterior-wall specimens under a range of simulated climatic conditions. The apparatus will be used for research in both steady-state and dynamic thermal performance in support of standard test methods; for study of the processes of heat transfer, air leakage and moisture transfer in building walls as aids to the design and construction of buildings for energy conservation; and to provide traceability in measurement to NBS through calibration services, Standard Reference Materials or the National Voluntary Laboratory Accreditation Program. The facility is being designed, constructed and operated under the joint sponsorship of the Department of Energy and the National Bureau of Standards as part of the National Program Plan for Building Thermal Envelope Systems and Insulating Materials, issued by the Department of Energy in January 1979.

31205 (ASHRAE/SP—28, pp 327-346) **Effective U-values for skylights.** Burkhardt, W.C. (Skylight Industries Inc., Independence, MO). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Increased interest in energy conservation, codes, and costs has prompted us to publish curves of effective U-values for skylights. Conventional U-values are used by architects and engineers to estimate heating and cooling loads of buildings. An estimate of these loads is necessary in order to properly size heating and air-conditioning equipment. Conventional U-values work well for this purpose. However, for energy computational purposes it does not work well especially for building elements that transmit light (like a skylight - for example). The reason being is that solar gain and daylighting advantages are not taken into account in establishing conventional U-values. Hence, we developed effective U-values which give a fairly good representation of the annual net energy balance through skylights.

31206 (ASHRAE/SP—28, pp 347-353) **Dynamic interpane systems for multipane solar collector windows.** Berlad, A.L. (State Univ. of New York, Stony Brook). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

It has been shown previously that for twin-pane windows, a variety of interpane blinds and/or other interpane structures can be employed to suppress natural convective and unwanted (infrared) radiative heat losses from a wintertime conditioned space to its cold exterior. For previously reported systems, effective R-values greater than 1.06m$^{2\circ}$ C/W (or 6[Btu/hr x ft$^{2\circ}$F]$^{-1}$) have been measured for solar acceptance mode operation and R-values greater than 1.76m$^{2\circ}$ C/W (or 10[Btu/hr x ft$^{2\circ}$F]$^{-1}$) have been measured for nighttime mode operation. New dynamic interpane systems have been investigated which utilize previously considered methods as well as forced convective flows, together with principles of regenerative heat exchange to suppress further the undesirable heat losses from a conditioned space. Design principles for such windows are discussed.

31207 (ASHRAE/SP—28, pp 411-420) **Extension of methods used in analyzing building thermal loads.** Cumali, Z.O.; Sezgen, A.O.; Sullivan, R.; Kammerud, R.C. (Consultants Computation Bureau/Cumali Associates, Oakland, CA). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

This paper details analytical procedures for use in building thermal loads analysis and modeling. The first technique discussed details the mathematical basis of a recursion relationship developed to define building/space weighting factors. The weighting factors generated encompass radiative and conductive heat gain and space air temperature fluctuations. To preclude the use of weighting factors, an additional technique is presented which makes possible the calculation of either a pseudo or real surface temperature; thus, space loads can be ascertained directly. Finally, the third procedure relates the frequency of specific input excitations to overall building response and/or energy consumption; this is primarily a procedural technique for simplifying the analysis and selection of architectural alternatives.

31208 (ASHRAE/SP—28, pp 421-435) **Heat transmission coefficients of concrete block walls with core insulation.** Shu, L.S.; Fiorato, A.E.; Howanski, J.W. (W.R. Grace and Co., Cambridge, MA). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

An investigation of heat transmission coefficients of 8-in. concrete block walls with and without core insulation is described. Measured average thermal conductance (C) and transmittance (U) values were obtained from Guarded Hot Box Tests (ASTM Designation: C236). They were compared with values calculated in accordance with current design practice. Test results differed considerably from design values. This was attributed to the following factors: (1) The thermal conductivity of a core insulation material is not the sole factor in the overall thermal performance of a masonry wall. The ability of the core insulation to fill all voids in the wall is also important. (2) Design thermal conductivities do not represent in situ material properties. (3) Design calculations of heat transmission coefficients do not reflect multi-dimensional heat flow conditions. Closer estimates of transmittance were calculated using measured rather than design conductivity values. However, it is recommended that measured U-values be used as a primary basis for the design of wall assemblies.

31209 (ASHRAE/SP—28, pp 472-490) **Technical review of the M factor concept.** Godfrey, R.D.; Wilkes, K.E.; Lavine, A.G. (Owens-Corning Fiberglas, Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

There is no question that massiveness of building envelopes affects instantaneous heat transmission through them under transient conditions. In an attempt to include these affects in ASHRAE Standard 90-75 calculations, masonry interests have developed a concept known as the M Factor. It has been proposed that the steady state conduction equation specified in 90-75 be modified by a multiplying factor (M Factor) to account for massiveness of the envelope. These factors were calculated by forming the ratio of dynamic heat flux to that predict by steady state methodology. Ratios were calculated for eight (8) orientations at 8 a.m. for a typical day in January and then averaged. Ten (10) wall types were considered in ten (10) cities in various climatic regions. These ratios are presented graphically as M Factor versus degree days for various wall masses. Although the simplicity of this approach is attractive, consideration of the definition raises serious questions about the technical validity. Most troublesome is implying seasonal energy performance based on a ratio calculated for one hour out of an entire year. Averaging the effect of exposures is also questionable. This paper will address the question of the significance of using one hour per year to characterize seasonal energy performance. Daily and seasonal heat fluxes are calculated using both dynamic and steady state procedures. Typical weather data are utilized. A broad range of wall characteristics are investigated including thermal resistance, massiveness, and placement of mass within the wall. These results are compared to those calculated for an average day in January at 8 a.m. In addition, the effects of interaction of internal partitions with exterior walls are discussed.

31210 (ASHRAE/SP—28, pp 508-521) **Statistical decision method for economic evaluation of the exterior envelopes of buildings.** Ercules, A.M. (FIAT Engineering Torino, Italy). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

The author describes a multi-stage adaptive statistical decision method which can help to define standards for the insulation of the exterior envelopes of buildings. Two types of uncertainty are explored. The first type involves possible changes in economical and competitive factors likely to affect cash flows. These factors will be referred to as states of the world. The second type involves the uncertainty of cash flows, once the states of the world are known. The method, based on Bayesian theory, is primarily concerned with the first uncertainty type. The decision maker is allowed to take differences in the time of future earnings into account, by the use of a discount rate. His attitudes towards risk and non-monetary utilities associated with the possible outcomes are considered in the decision procedure. As an example it is shown how, in a real-world case, the proposed method can lead to results that are substantially better than the ones obtained by more conventional techniques.

31211 (ASHRAE/SP—28, pp 587-594) **Energy conservation opportunities in the building envelope through the enforcement of a mandatory energy code.** Miller, D.R. (Massachusetts Building Code Commission, Boston). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

The Massachusetts State Building Code has included energy conservation provisions based on ASHRAE Standard 90 for the building envelope and mechanical/electrical systems since January, 1978. As part of its programmatic review the Building Code Commission has been monitoring the implementation of these energy conservation regulations via a plan review service for all non-residential buildings. Since the Commission staff reviews a large portion of new construction building designs, the service provides a vehicle to maintain close contact with both the design and code enforcement communities, but more significant is that it provides a check on the level of energy conservation designed into today's buildings. The results of this monitoring activity are startling as the staff of the Commission gains insight to the state-of-the-art in energy efficient building design. Three facts are becoming increasingly clear: Standard 90 is inadequate in setting the direction for conservation in new buildings; design professionals need to be sensitized to the energy performance of the building envelope; and construction detailing of building envelope assemblies is frequently deficient. While no quantitative estimate is available of the energy wasted in this latter case, the loss cannot be underestimated.

31212 (ASHRAE/SP—28, pp 595-606) **Implementation of building energy standards in New York State.** Albrecht, R.J.; Jones, J.D. (New York State Energy Office, Albany). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

The development of energy efficiency standards for new and renovated buildings in New York state is described. Educational activities and the technical assistance program associated with the Energy Code are also described. The standardization of procedures and test methods for energy code compliance are discussed.

31213 (ASHRAE/SP—28, pp 638-650) **Sandwich panels with foamed polyurethane insulation.** Larsson, L.E. (Chalmers Tekniska Hoegskola, Goeteborg, Sweden). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A large number of long-term tests (most tests over 7 years) on sandwich panels comprising thermal insulation of foamed polyurethane of 30-40 kg/m^3 density and different thicknesses, and different facing layers such as glass fibre reinforced polyester, plasterboard, chipboard, wood fibre board, asfaboard, plywood and steel sheeting demonstrate that the very good thermal insulation properties of foamed polyurethane, apparent thermal conductivity $\lambda = 0.017 - 0.024\ W/m^{\circ}C$ ($0.12 - 0.17\ BTU \times in/h\ ft^{2\circ}F$) in the different tests, are not changed over a period of time. Test loading of wall and floor panels has shown that these panels can easily be constructed in such a way as to satisfy code requirements relating to loadbearing capacity and limitation of deformations, for instance in single-family houses. Fire tests show that the inside facing layer is critical with regard to the fire resistance of the construction. A wall panel comprising a loadbearing timber frame, 110 mm thermal insulation of foamed polyurethane and an inside facing layer of 15 mm glass fibre reinforced plasterboard resisted a standard fire in conformity with ISO 834 for 35 minutes without failure in the wall subjected to a compressive force. There was no rise in temperature at all on the side remote from the fire. Evolution of smoke was of limited extent.

31214 (ASHRAE/SP—28, pp 662-677) **Thermophysical properties data base activities at Owens-Corning Fiberglas.** Wilkes, K.E. (Owens-Corning Fiberglas, Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

The success of any modeling effort depends upon the material property data used as input. To provide a firm foundation for our modeling efforts an activity was started at the Owens-Corning Fiberglas Technical Center for development of a data base of thermophysical properties of building materials. The purpose of this paper is to review the rationale for and the activities in this effort. Deficiencies in existing compilations of property data and the need for an expanded data base are discussed. Sources of literature data and the steps taken to collect and archive original references are described. A description is given of the steps taken to utilize the literature data. Included are details of the tabulations of property data, statistical analyses of data, and the generation of recommended sets of property values. Examples are given of the information contained in a data book being prepared, including tabular and graphical displays of data, and recommended equations.

31215 (ASHRAE/SP—28, pp 757-780) **Principles of building science and thermography needed to diagnose the performance of building enclosures.** Mill, P.A.D. (Public Works Canada, Ottawa, Ontario). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Effective preventive maintenance can be applied to buildings, through improvements in diagnostic techniques and developments of building science knowledge. Recent developments in the field of thermography demonstrate that an infrared camera operator, with expertise in building science, can accurately interpret thermal images. The application of thermography is the technique used to produce heat pictures from invisible radiant energy. The objective, at all levels of thermography, is to assess the thermal efficiency of building enclosures by measuring the varying levels of thermal radiation. At present, building science knowledge is not being applied to identify problems correctly, or to recommend and implement remedial measures. Thermography contributes to the effective application of this knowledge. The biggest dollar savings from Energy Efficiency programs comes from preventing enclosure degradation in the short term, and energy savings through improved efficiency of the enclosure in the long term.

31216 (ASHRAE/SP—28, pp 930-941) **Mobile window thermal test facility (MoWiTT).** Klems, J.H.; Selkowitz, S.E. (Lawrence Berkeley Lab., CA). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A Mobile Window Thermal Test Facility is currently being developed as part of the LBL energy Efficient Windows Program. The MoWiTT concept, design goals, and instrumentation system are described.

31217 (ASHRAE/SP—28, pp 952-964) **Aged thermal resistance (R value) of foil-faced polyisocyanurate foam thermal insulation board.** Sherman, M. (Jim Walter Research Corp., St. Petersburg, FL). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

The aged thermal resistance (R value) of gas-barrier quality aluminum foil-faced polyisocyanurate foam thermal insulation board has been determined in ASTM C236 guarded hot box tests conducted in three qualified testing laboratories on full-size boardstock. Common-lot materials were measured in 1976 (15 to 33 months after manufacture) and retested in 1978-1979 (47 to 68 months after manufacture). Analysis of results indicates: (1) Essentially no change in R per inch thickness over this extended (15 through 68 months) period of time after product manufacture with or without glass fiber reinforcement. (2) Demonstrated low order magnitude of change in average R per inch from one month after manufacture (8.34) to time-aged plateau (7.04): approximately 15%. (3) The linearity of aged R value with product thickness at three mean temperatures: (a) 7.81 R/inch at 40°F mean temperature; (b) 7.04 R/inch at 75°F mean temperature; (c) 6.39 R/inch at 110°F mean temperature. (4) A linear relationship between R/inch and insulation mean temperature; an increase of 0.021 R/inch with each °F decrease in mean temperature, in the temperature range investigated. (5) Confirmation of the precision capability of the ASTM C236 Guarded Hot Box test method conducted in three NVLAP-accredited testing facilities; individual laboratory averages within 5% of three-laboratory averages; three-laboratory averages with coefficients of variation within 2.5 to 3.6%.

31218 (ASHRAE/SP—28, pp 987-1004) **Impact of insulation placement on the seasonal heat loss through basement and earth-sheltered walls.** Meixel, G.D.; Shipp, P.H.; Bligh, T.P. (Univ. of Minnesota, Minneapolis). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A transient, finite difference computer program has been developed and utilized to investigate the dynamic thermal performance of basement and earth-sheltered walls to determine the spatial and temporal characteristics of the heat flux through these walls. Comparisons between underground walls and between underground and aboveground walls serve to: (1) delineate limitations of the current American Society of Heating, Refrigeration, and Air-Conditioning Engineers (ASHRAE) recommended procedure for assessing the heat loss through basement walls; (2) present evidence for the possibility of freeze/thaw or frost-heave damage to inappropriately insulated basement walls; and (3) demonstrate the significant benefits to the annual energy balance that can be achieved through appropriate insulation to take maximum advantage of both the thermal buffering characteristic of the soil mass and its potential as a heat sink. These initial studies of several different insulation configurations highlight critical aspects of effective insulation strategies for earth sheltered walls.

31219 (ASHRAE/SP—28, pp 16-32) **Proposed streamlined residential heating. Energy budget analysis by a variable temperature design method.** Hans, G.E. (Dept. of Agriculture, Madison, Wisconsin). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A method for residential heating load calculations based on recognition of variable reference temperatures is presented. The method permits streamlined consideration of solar energy credits in design analysis.

31220 (ASHRAE/SP—28, pp 73-82) **Computer-aided energy savings redesign of the exterior envelope of an apartment building.** Mueller, G.R.; Pedreyra, D.C. (Mueller and Pedreyra Consulting Engineers, Englewood, CO). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A finite difference thermal analyzer was used to predict energy savings affected by redesign of the exterior envelope of a Denver hi-rise apartment building. The redesigned building utilized passive solar features that will save 40% of the energy required for the original building and can increase the comfort level during the hot summer months. The thermal modeling technique is described in detail for three building configurations. The passive solar elements investigated included building orientations, thermal mass of wall and size and shading of windows. Monthly energy requirements for each configuration are presented in tabular form.

31221 (ASHRAE/SP—28, pp 138-148) **Analysis of infiltration by tracer gas technique, pressurization tests, and infrared scans.** Stewart, M.B.; Jacob, T.R.; Winston, J.G. (Owens-Corning Fiberglass, Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

The natural ventilation experienced by three unoccupied houses was measured over a one year period by a tracer gas technique. An energy audit was also performed using a fan to pressurize and depressurize the house along with an infrared scanner to detect the leakage paths. The houses were of a standard design and identical except for insulation levels. All houses were built by the same contractor at the same time. The tracer gas measurements were converted to a format similar to the pressurization results by using a previously developed model. The two methods placed the houses in the same relative ranking in terms of leakiness but the pressurization technique indicated much smaller differences than did the tracer gas technique.

31222 (ASHRAE/SP—28, pp 178-194) **Air leakage characteristics and weatherization techniques for low-income housing.** Grot, R.A.; Clark, R.E. (National Bureau of Standards, Washington, DC). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Data are presented on the air leakage characteristics of approximately 250 dwellings occupied by low-income households in 14 cities, in all major climatic zones of the US. Two types of measurements were used: a tracer-gas decay technique using air sample bags, which was developed at the National Bureau of Standards to measure natural air infiltration; and a fan depressurization test that measures induced air exchange rates. The data presented here show that for this group of dwellings natural air infiltration rates are distributed approximately lognormally. The induced air exchange rates are a measure of the tightness of building envelopes. There is little correlation between the natural air infiltration rates and the induced air exchange rates in these dwellings, unless the buildings are divided into classes of similar buildings. The use of fan depressurization as a diagnostic tool to assist weatherization crews in tightening buildings is discussed. Preliminary estimates are presented of the reduction in induced air exchange rates that may be achieved by applying building weatherization techniques.

31223 (ASHRAE/SP—28, pp 195-217) **Air leakage measurement and reduction techniques on electrically heated homes.** Collins, J.O. Jr. (Johns-Manville Sales Corp., Denver, CO). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Under the sponsorship of the Electric Power Research Institute, Johns-Manville undertook a two year program to evaluate the effect of air leakage on the heating requirements of 29 electrically heated homes in the Denver, Colorado area. Following the measurement of the rate of induced air leakage using the Super Sucker, the 29 homes were retrofitted specifically to minimize leakage and subsequently retested. Thirty similar homes were also tested for leakage and retained as controls. The Public Service Company of Colorado, a major participant in the program, fitted all of the 59 homes with submeters to measure the energy consumption associated solely with heating. They have also undertaken the reading of these meters each month, the compilation of an energy profile for each house, and the issuance of a monthly questionnaire to each homeowner relating to energy conservation methods or life style changes which might affect the measured heating energy usage. Their contribution to the program has been invaluable. This paper describes the retrofit methods, their effect upon the induced air leakage, the other data which are being collected, and the data analyses which are expected at the completion of the program.

31224 (ASHRAE/SP—28, pp 250-261) **Comparison of BTR measurements.** Janssen, J.E.; Pearman, A.N. (Honeywell Inc., Minneapolis, MN). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Evaluation of the effectiveness of building insulation is a task of growing importance. Five different methods are described for measuring or computing the overall Building Thermal Resistance of a residential structure. Data comparing the methods are presented for a one story, slab-on-grade house located in southern California. Results generally agree within +5% of the ASHRAE calculation procedure.

31225 (ASHRAE/SP—28, pp 262-268) **Calorimeter for measuring heat flow through walls.** Brown, W.C.; Schuyler, G.D. (National Research Council of Canada, Ottawa, Ontario). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Studies on residential energy use have indicated a need for field measurement of heat loss from houses. One of the prime areas of loss is transmission heat loss through the building envelope. Field measurement of heat loss through the basement walls and floor, the above-grade walls and the ceiling is useful in establishing the energy balance in a house. The field measurement of heat loss from these areas is also useful in comparing in-situ heat loss with heat loss predicted from steady-state thermal properties and field climatic conditions. The measurement of heat flow in the field requires a calorimeter that does not affect the heat flow it is meant to measure; that is, it must not alter the surface temperature of the specimen. For field measurement the calorimeter should be simple to operate yet reasonably accurate, and it must be portable. The calorimeter must meter a large area to permit determination of a representative heat loss value, because of the inhomogeneous nature of building elements and the temperature variation over their surfaces. This paper describes the construction, accuracy check and use of a portable calorimeter developed primarily for a study on energy conservation in four experimental houses, undertaken by the

Division of Building Research, National Research Council of Canada.

31226 (ASHRAE/SP—28, pp 381-391) **Dynamic response of conventional residential construction to solar radiation through windows during the heating season.** Cumali, Z.O.; Sullivan, R.; Sezgen, A.O.; Hossli, R.I. (Consultants Computation Bureau/Cumali Associates, Oakland, CA). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A significant potential for increasing the contribution of solar heating during the heating season has been overlooked. This increase can be effected by improving the orientation of standard windows and sliding glass doors in conventional low-mass residential buildings. Currently, building regulations do not provide incentives for placing more glass on south facing walls. There is no standard calculating procedure; hence, overheating may occur when glazed areas are too large for low-mass construction. The National Fenestration Council is sponsoring this study to develop recommendations for maximum glazing areas and to investigate the effect of this glazing on summer cooling loads. This paper details the definition and structure of a comprehensive parametric study which treats the thermal response of a typical single family residence. A representative range of climate zones and geographical orientations, two floor structures and two air-circulation schemes are to be made in the course of an analysis which features a primary parametric on south facing window sizing. A modified version of the DOE-2A energy analysis program will be used in the study. It is intended that the results will yield sufficient data to support recommendations on optimum glazing areas for low-mass construction.

31227 (ASHRAE/SP—28, pp 436-455) **Modeling of residential attics.** Wilkes, K.E. (Owens-Corning Fiberglas, Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A review is given of the available models that have been used to predict the thermal performance of residential attics. The models are first compared qualitatively on the basis of the following features: treatment of ventilation air, inclusion of heat capacities of the roof, ceiling and air space, treatment of radiation heat exchanges, inclusion of heat transfer through gable ends, and dependence of heat transfer coefficients upon temperature and temperature difference. A brief description is then given of a facility for measurements of attic thermal performance under simulated steady-state and dynamic conditions. Included in this description are the boundary conditions to be imposed on attic test sections. Ceiling heat fluxes and attic air temperature predicted by the various models are then compared to some preliminary results of tests under controlled conditions.

31228 (ASHRAE/SP—28, pp 456-471) **Mathematical modeling and computer simulation of insulation systems in below grade applications.** Wang, F.S. (Dow Chemical U.S.A., Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A finite element program for simulating two-dimensional heat conduction in foundation and basement walls and slab-on-grade systems is presented. Ground freezing and thawing are treated in the model and time-dependent boundary conditions can be stipulated. Some results of heat loss studies of basement walls with and without insulation are described.

31229 (ASHRAE/SP—28, pp 493-507) **Method of rating the thermal efficiency of a home envelope relative to an energy efficient standard.** Blancett, R.S. (Owens-Corning Fiberglas, Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A method was developed for rating the thermal efficiency of a home envelope relative to energy efficient standards. The method was developed at the request of the US League of Savings Associations for use by real estate appraisers or lending officials and is a Class B type audit procedure. A scorecard is utilized where points are awarded for energy conserving features of a home envelope. The scorecard is used to compare points awarded to points based on an energy efficient standard. Homes with a low relative rating are identified as potential retrofit candidates. Retrofit measures are assigned a priority relative to cost of the retrofit and benefits obtained. The method considers envelope retrofit options which reduce heating requirements.

31230 (ASHRAE/SP—28, pp 522-540) **Economic considerations in insulating masonry and wood-frame walls of single-family housing.** Petersen, S.R. (National Bureau of Standards, Washington, DC). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Maximum economic levels of insulation in masonry walls are expected to be lower than those for wood-frame walls in many parts of the US for two reasons: (1) insulation costs are significantly higher for masonry walls, and (2) energy savings are somewhat lower because of differences in the dynamic thermal performance of the two wall types. This report examines the impact of both of these factors in determining economically optimal insulation levels for several types of wall construction used in single-family housing, over a wide range of geographic locations. The NBSLD computer program is used to calculate reductions in annual heating and cooling requirements due to several levels of insulation in each of four wall variations examined. Economically optimal insulation levels (based on life-cycle cost analysis) are calculated for a wide range of assumptions related to climate, energy prices, insulation costs, and present worth factors.

31231 (ASHRAE/SP—28, pp 541-569) **Economic comparison and thermal performance of several different insulated wall constructions.** Yuill, G.K.; Proskiw, G. (UNIES Ltd., Winnipeg, Manitoba). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Field measurements were performed on five electrically heated, unoccupied houses with different types of exterior wall sections, to determine their comparative energy consumption characteristics. Three of the houses used fiberglas insulation and various types of stud frame construction while the remaining two houses utilized log construction techniques. The data generated over the 15 day test period was in close correlation to comparative, predicted patterns calculated using the Net Annual Heat Loss Factor (NAHLF) method. The tests also showed that the energy savings predicted for the extra insulation levels in the stud frame walls were realized in practice. Both log structures exhibited higher heat losses than any of the frame walls, primarily due to very high air infiltration rates. An economic analysis revealed that the extra costs for the stud walls, triple glazing and higher ceiling and floor insulation levels were easily justified. A comparison between electric resistance heating costs in Canada and the US indicated that American insulation levels should be as high or higher than Canadian levels despite the climatic differences.

31232 (ASHRAE/SP—28, pp 651-661) **Performance of an energy efficient residence vs a conventional comparison home.** Johnson, R.J. (NAHB Research Foundation, Inc., Rockville, MD). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

How much energy can be saved in a typical new home with off-the-shelf products and techniques? Are the savings worth the extra cost? Do predicted energy savings agree with actual energy savings? To answer these and many more practical questions, the Technology and Energy Conservation Division of Policy Development and Research of the Housing and Urban Development Department sponsored the design and construction of an Energy Efficient Residence (EER) and a Conventional Comparison Home (CCH) by the NAHB Research Foundation, Incorporated. Detailed operating data for both homes while occupied for one complete calendar year, February 1, 1978 to January 31, 1979 are presented.

31233 (ASHRAE/SP—28, pp 751-756) **Transient thermal response of an intermittently cooled massive building.** Gujral, P.S.; Clark, R.J.; Burch, D.M. (National Bureau of Standards, Washington, DC). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A one-room externally insulated masonry test structure was built inside an environmental chamber at the National Bureau of Standards. This structure was exposed to diurnal sol-air summer temperature cycles, and two energy conservation schemes were investigated. For both schemes, the interior mass of the structure was cooled during the night hours, first by mechanical cooling and second by ventilation with outdoor air. The results indicated that mechanical cooling effectively cooled the interior mass during the night hours such that no additional daytime cooling was needed for even the most extreme summer conditions. The tests further indicated that ventilation with outdoor air effectively cooled the structure to the point where no mechanical cooling was needed for summer conditions representative of many parts of the US. The experimental test results compared well with those obtained from an analytical model.

31234 (ASHRAE/SP—28, pp 801-815) **Field study of moisture damage in walls insulated without a vapor barrier.** Tsongas, G.A.; Odell, F.G.; Thompson, J.C. (Portland State Univ., OR). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Considerable uncertainty has existed over whether or not wall insulation installed without a vapor barrier causes an increased risk of moisture damage (wood decay) within walls. This paper describes the results of a study aimed at finding out if such a moisture problem really exists. The exterior walls of a total of 96 homes in Portland, Oregon were opened, of which 71 had retrofitted insulation (three types) and 25 were uninsulated. Field and laboratory test results are presented which show the absence of moisture accumulation, and wood decay fungi, or other indications of moisture damage in the walls of the test homes. Data on shrinkage and settling of insulation are also given, as are results of air leakage measurements by fan depressurization tests. The study concludes that the addition of wall insulation without a vapor barrier does not cause moisture damage in existing homes with wood siding in climates similar to that of Western Oregon. The overall advisability of future retrofitting of wall insulation is discussed.

31235 (ASHRAE/SP—28, pp 816-835) **Effect of moisture on the thermal conductance of roofing systems.** Knab, L.I.; Jenkins, D.R.; Mathey, R.G. (National Bureau of Standards, Washington, DC). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

The results of laboratory tests are presented describing the effect of moisture content on the thermal conductance of roofing systems containing insulation. Roofing systems, consisting of five types of rigid-board roof insulations with attached four-ply bituminous built-up membrane, were tested. Moisture was induced into the roofing system specimens by maintaining a constant water vapor pressure difference across them. Moisture gain in the insulation varied depending on the type and thickness of the insulation. A procedure was developed, using a heat-flow meter apparatus (ASTM C 518 type), to carry out thermal conductance tests on roofing specimens containing moisture. More than 200 tests were performed over a wide range of moisture contents. The approximate moisture distribution in the insulation was determined from core samples. Relationships between the thermal conductance and moisture content are presented. The relationships show that the presence of moisture in roofing systems can cause significant increases in thermal conductance, depending on the type and thickness of the insulation.

31236 (ASHRAE/SP—28, pp 836-846) **Comparative studies of vapor condensation potentials in wood framed walls.** Wang, F.S. (Dow Chemical, Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Vapor condensation in exterior walls can affect the performance of thermal insulation but quantitative assessments of this effect are lacking. This study explored the sensitivity of the condensation potential in relation to insulation position. A moisture balance was performed for a hypothetical house to illustrate the relative significance of vapor transport modes. A controlled field test experiment was also performed and the results are presented.

31237 (ASHRAE/SP—28, pp 856-874) **Ventilation of back space of building enclosure siding for solar heat gain reduction.** Homma, H.; Guy, R.W. (Toyohashi Univ. of Technology, Japan). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

The effect of ventilation in the space between a main wall and an exterior siding is examined with respect to reducing the building's cooling load. The buoyant force of the air in the space is considered as the motive force of air flow and the effect is treated as a problem of simultaneous heat and mass-transfer. A simulation program of heat and air flows in a wall has been developed using laminar flow theory, and its validity is examined by the comparison of the simulation results with a weather exposed full-scale model test. The computer simulation shows that the ventilation of air spaces has the potential to reduce the radiative heat gain of both opaque walls and of triple glass windows.

31238 (ASHRAE/SP—28, pp 875-886) **Experimental investigation of the effect of added insulation on water vapor condensation in mobile home roof cavities.** Carlson, T.C.G.; Luce, R.G. (Owens-Corning Fiberglas, Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

The influence of increasing thermal insulation in the attic space of mobile home roofs on water vapor transport and water damage was investigated. Two laboratory environmental test chambers were designed and constructed to simulate outside winter ambient and interior mobile home living space conditions. In addition the effect of roof skin heating due to sunlight was also simulated. Two basic roof section designs, each with three thermal insulation configurations, were examined. These were a standard and a raised-heel bow truss. The test specimens were constructed using actual mobile home roof construction procedures and materials. Based on the measured test results and post-test visual observations, it was concluded that added levels of thermal insulation in the attic space of mobile home roofs will not increase condensation or water damage, provided an effective vapor barrier is installed above the ceiling board. In addition, test results indicated that condensation may form between the vapor barrier and ceiling board for roof sections having either conventional insulating packages or increased insulation packages. It was observed that for all insulating systems, moisture condensation occurred on the warm side of the vapor barrier where the ceiling boards were fastened to the wooden trusses. Further examination of this problem is planned.

31239 (ASHRAE/SP—28, pp 887-897) **Annual cycle moisture analysis.** Stewart, M.B. (Owens-Corning Fiberglas, Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

The method currently used to screen construction types for possible condensation is the steady state ASHRAE dew point technique. This method estimates the outside conditions necessary to produce condensation within the wall but ignores the dynamics involved in daily and seasonal cycling of temperature and humidity. Other important characteristics of walls include the total amount of moisture accumulated during the winter and the length of time the moisture remains in the wall during the spring and summer months. This paper examines the effect of location and magnitude of the permeance of building materials, solar heating, daily and seasonal climatic variations, indoor relative humidity, and insulation level on the dynamic moisture behavior of a wall. Hourly calculations using weather data from the Minneapolis area are used to determine dynamic behavior for several wall types. Limitations of this method are discussed.

31240 (ASHRAE/SP—28, pp 901-915) **Field survey of the performance properties of insulation used to retrofit cavity walls of residences.** Rossiter, W.J. Jr.; Weidt, J.L.; Saxler, R.J. (National Bureau of Standards, Washington, DC). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A study was conducted to obtain information on the performance of retrofit insulations which had been installed in the sidewalls of existing residences. Most of the thirty-nine houses included in the study had wood-frame sidewall construction and were located in the mid-west, mid-Atlantic and Northeast. The insulations represented those commonly used in the US to retrofit sidewalls of housing: urea-formaldehyde based foam, loose-fill cellulose, and loose-fill mineral fiber. With few exceptions, the insulations had been installed in the sidewalls at least 2 years prior to their examination and their ages ranged from about one and a half to ten years. In the field phase of the study, small sections of sidewalls were opened in the late fall or early winter and the retrofit insulations were examined. Observations were made on performance factors such as: the completeness of filling the cavity, the condition of the insulation and wall components, and evidence of moisture accumulation such as water stains on sheathing, studs and other wall components. In the laboratory phase of the study, insulation specimens removed from the walls of the residences were tested to determine their density, thermal resistivity and moisture content. In addition, the pH of the urea-formaldehyde based foam specimens was determined. Results of the laboratory measurements are discussed and compared with data and information obtained from other studies. Results indicated that the retrofitting of the inspected sidewalls was for the most part accomplished without adverse effect upon them.

31241 (ASHRAE/SP—28, pp 916-929) **Recommended insulation retrofit techniques for mobile homes with a simple payback analysis.** Carlson, T.C.G.; Bemis, R.S. (Owens-Corning Fiberglas Technical Center, Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

A study was conducted to identify techniques for reinsulating mobile home roofs, sidewalls, and floors and for investigating economic incentives that might lead the homeowner to take such action. Since mobile homes are significantly different than site built homes, this study went beyond conventional reinsulation techniques, as many of them would not be applicable to mobile homes. Seven retrofit techniques were evaluated; four for the roof cavity, two for sidewalls, and one for floors, using conventional insulation materials. Actual mobile homes or mock-up structures were used for the evaluation. To determine the economic feasibility of reinsulating mobile homes, thermal and economic analyses were prepared. The thermal analysis was based on steady state one dimensional heat transfer, the economic analysis on simple payback. Maximum existing insulation levels for which it would still be economically worthwhile to upgrade insulation were determined based on a sample 7-year payback period. The analyses examined four modes of heating and cooling and utilized 1978 utility rates. They were performed on mobile home roofs, sidewalls, and floors for 256 US cities, with results summarized by six climatic zones. Two of the retrofit techniques evaluated for roof cavities, one for sidewalls, and one for floors are recommended for use. The analyses have shown that candidate mobile homes will meet a 7-year payback criterion in most climatic zones when low-levels or no insulation exists in the roof, sidewall, and floor cavities.

31242 (ASHRAE/SP—28, pp 965-977) **Effective thermal performance of an insulated standard stud wall containing air gaps.** Tye, R.P.; Desjarlais, A.O.; Bourne, J.G.; Spinney, S.C. (Fiber Materials, Biddeford, ME). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

An experimental investigation of the effective performance of a cavity wall assembly has been undertaken using the standard guarded hot box procedure. Measurements of the thermal conductance were obtained with the cavities completely filled with a cellular plastic and then partially filled with accurately machined pieces of the same cellular plastic which simulated different sizes, positions and orientations of air gaps, particularly representative of those due to shrinkage. The results indicate that there is a direct relationship between effective thermal performance and size of air gap of the order to 5% loss for each 1% of shrinkage. The results are both analyzed and compared with previous analyses for such systems and discussed with respect to installation, aging and other factors affecting in situ performance. The results have been used to calculate derating factors for the effective thermal resistances. The results confirm the validity of the NBS Derating Analysis for deriving effective resistance of materials which shrink within a cavity.

31243 (ASHRAE/SP—28, pp 160-177) **Air exchange measurements in a high-rise office building.** Hunt, C.M.; Treado, S.J. (National Bureau of Standards, Washington, DC). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Air exchange rates were measured in the tower of an 11-story office building using SF_6 as a tracer gas. Inside-outside pressure difference measurements were also monitored as a function of temperature and wind speed. Fall and winter air exchange rates, I (hr^{-1}), measured with make-up and main exhaust pathways blocked could be represented as a function of wind speed, W (mi/hr), by the equation $I = 1.08 + 0.036W - 0.0005W^2$, $\sigma = 0.15$. Wind direction and temperature difference (stock effect) exerted little effect on air exchange rate. In this building, toilet exhausts and other weather independent mechanisms were more important than natural infiltration in producing air exchange. Also, a preliminary analysis of predicted air infiltration by the Shaw-Tamura model was undertaken. The results of this preliminary analysis were consistent with the observations that the stack effect was unimportant and that natural infiltration contributed only part of the total air exchange. However, the plot of calculated infiltration rate as a function of wind speed, using the Shaw-Tamura model, had a different form from the plot of measured data.

31244 (ASHRAE/SP—28, pp 354-367) **Thermal performance of vinyl covered fiberglass solar screens.** Brakefield, C.; Hein, D.E. (Phifer Wire Products, Inc., Tuscaloosa, AL). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

During the past decade, vinyl covered fiberglass solar screening has evolved from insect screening with a capability, as judged by shading coefficients, of eliminating up to 75% of the summer solar heat gain. Calculated results of heat transfer coefficients (4 values) for a single pane window system in winter heating conditions have suggested some dramatic reductions in thermal transmittance with the addition of solar screens. This paper addresses the thermal performance of a porous screening applied to fenestration products and its effect on the annual energy balance. The program utilized the latest technology for evaluating thermal performance under accepted laboratory controlled environments for summer and winter conditions, both daytime and nighttime.

31245 (ASHRAE/SP—28, pp 781-797) **Thermal performance of the Norris Cotton Federal Building in Manchester, New Hampshire.** Richtmyer, T.E.; May, W.B.; Hunt, C.M.; Hill, J.E. (National Bureau of Standards, Washington, DC). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

The Norris Cotton Federal Office Building is a medium-size 7-story government office building of approximately 11,000 m^2 (117,000 ft^2) total floor space. It is located in Manchester, New Hampshire and has been designed to demonstrate a number of energy saving concepts. Some of the major energy conserving features of the building are the use of solar collectors; heavy masonry construction with exterior insulation; small overall window area; heat recovery from heat pumps, chillers, a natural gas-powered engine/generator, and the ventilation system; modular boilers; thermal storage tanks; and a variety of energy conserving lighting systems. This paper will describe the building's thermal performance for the first three years of operation. The energy consumption in the building is presented and compared to the original design goal of 625 MJ/(m^2 x year) (55kBtu/(ft^2 x year)). The differences will be explained using the results of thermographic measurements and measurements of air exchange rates in the building along with analysis of the weather data and building operation problems that have occurred since 1976. It has been found that it is difficult to actually achieve designed-for performance in this building because its experimental mechanical system is unusually complex and its construction details are unconventional.

31246 (ASHRAE/SP—28, pp 942-951) **Energy conservation study for Puerto Rico Aqueduct and Sewer Authority building.** Fogleman, S.R. (Consulting Engineers and Energy Management Consultants of San Juan, Puerto Rico). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

This paper is about the study and investigation of various energy conservation opportunities in connection with the building envelope and mechanical and electrical systems of the Puerto Rico Aqueduct and Sewer Authority building. The ten-story building, located in San Juan, has a gross floor area of 165,000 square feet and is used mainly for offices. The Cal/ERDA computer program (presently DOE-2) for energy utilization analysis of buildings was the principal basis for the calculations with manual and other computer calculations for wall and window heat transmission and solar heat gains used to complement the Cal/ERDA calculations. The results of the study of each Energy Conservation Opportunity is reported including yearly savings in electrical energy and the resulting pay back periods. Table shows comparable individual savings of all the various Energy Conserving Opportunities for 1 year, 5 years, and 10 years including long term monetary savings and savings in barrels of oil over a 20 year period. The results of the computer program evaluation indicates close agreement between the actual building energy consumption and that predicted by the computer calculations. The annual energy savings when all the energy conserving measures are combined amounts to 28% of the annual energy consumption with a pay back period of 18 months.

31247 (ASHRAE/SP—28, pp 368-380) **Energy potential of daylighting in a classroom.** Gillette, G. (National Bureau of Standards, Washington, DC). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

An analysis is presented where a classroom of prescribed size and occupancy has various fenestration designs applied to it and the resulting thermal and daylighting energy performance calculated. An attempt is made to relate the heating/cooling requirements of a window opening with its potential as a source of natural light. The parameters glass area, glass type (double-pane, reflective, etc.), and ceiling height are evaluated for a classroom in Ann Arbor, Michigan operated over the course of a 9-month school year. Comparisons are made between the performance of a design based on ASHRAE Standard 90-75 and alternate fenestration designs. Although the computerized thermal analysis and the daylight analysis had to be done separately, actual weather data and corresponding daylight readings for Ann Arbor, Michigan are used for both. Results show a potential energy savings when daylighting is carefully integrated into the buildings envelope design, especially for southern exposures, but such savings will be realized only if applied with the other energy variables in mind.

31248 (ASHRAE/SP—28, pp 570-586) **Building envelope thermal performance standard, the Texas approach.** Hart, M.N.; Jones, J.W.; Bowen, W. (Energy Engineering Associates, Inc., Austin, TX). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

In 1975, the State of Texas Legislature mandated that energy conservation standards be developed for new State buildings. The legislation called for the development of performance criteria and for guidelines for energy efficient design for different classes of state-owned or financed buildings. In response to this legislated mandate, the State Building Commission developed a standard which provided performance criteria for the building envelope and the building system components separately. The State of Texas Building Energy Conservation Standard is divided into sections on the envelope, mechanical equipment, lighting, and service hot water. The building envelope section provided a new approach intended to address concerns expressed by the state's architects. It sets thermal performance of the shell by specifying an Energy Envelope Index (EEI) as a function of building size and location. The standard is structured such that compliance with the EEI may be determined by the architect early in the design. The EEI method has proved to be a useful tool, aiding the architect in initial design decisions. The EEI considers the influence of geometric factors, climatological variables such as temperature and solar irradiation, and the interaction of internal and envelope loads. The EEI calculations are extensions of standard procedures for estimating loads (such as those published by ASHRAE). These procedures are summarized in this paper and highlighted with examples.

31249 (ASHRAE/SP—28, pp 678-694) **Analysis and measurement of the thermal behavior of the walls and surrounding soil for a large underground building.** Meixel, G.D. Jr.; Shipp, P.H.; Ramsey, J.W. (Owens-Corning Fiberglass, Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

In a program designed to ascertain the merits of extending earth-sheltered design concepts to a large commercial structure, measurements and analyses are being conducted at the University of Minnesota. From measurements obtained for the 1978 calendar year at a earth-sheltered building on campus, the dynamic heat transfer interactions between the building walls and the surrounding soil have been demonstrated and experimental verification has been provided for a transient, finite difference heat transfer computer program developed for the analysis of earth-sheltered building envelopes. Computer generated contour plots detail the influence of the building and the seasonal fluctuations of the soil temperatures while graphically illustrating the thermal storage characteristics of the surrounding soil mass. Wall heat flux measurements have been made at regular intervals as well as soil temperature and moisture content measurements to determine the effect of different soil types and ground surface conditions around the building perimeter.

31250 (ASHRAE/SP—28, pp 631-637) **Thermal spacers improve roof insulation performance of metal buildings.** Waite, H.J.; Snyder, M.K. (Dow Chemical U.S.A., Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

Measured U-values for insulated roofs of prefabricated metal buildings are considerably different from calculated U-values due to the synergism between insulation, fastener, and roof components in their fabricated state. A system of thermal spacers for improving performance of these roof types is described.

31251 (ASHRAE/SP—28, pp 847-855) **Moisture condensation above insulated suspended ceilings - experimental results.** Hart, G.H.; Carlson, T.C.G. (Owens-Corning Fiberglas, Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

One of the common methods of reinsulating above the heated and cooled space of a commercial building is to apply insulation above the grid suspended ceiling. However, there is concern that during the heating season, moisture condensation problems may occur in the cool space (i.e., the plenum) between the roof and the insulated suspended ceiling. For this reason, an experimental program to determine humidity within a plenum above an insulated suspended ceiling as a function of plenum temperature and indoor relative humidity was undertaken. A test chamber was designed and constructed to simulate a cold plenum space and a warm, humidified interior living space. During the tests, the temperature in the warm space below the suspended ceiling was held at approximately 70 F while the relative humidity was incrementally increased to a level in excess of 60%. Temperatures in the plenum were lowered to a minimum value of 5 F. Water vapor moved through the ceiling panels at the rate allowed by the commercial materials and installation. The low vapor permeance of an actual built-up-roof system was simulated with a heavy plastic sheet. The results of the experimental work demonstrated that the simplified model currently used for predicting moisture concentrations in plenum spaces is not accurate. In addition, the experimental results and subsequent moisture migration calculations demonstrated that moisture condensation is not likely to be a problem above the insulated suspended ceilings investigated.

31252 (ASHRAE/SP—28, pp 978-986) **Direct approach to retrofitting - protected membrane roofing.** Deal, P.N. (Dow Chemical U.S.A., Granville, OH). 1981. NTIS, PC A99/MF A01. File Number DE83014620. (CONF-791233—).

From Conference on thermal performance of the exterior envelopes of buildings; Orlando, FL, USA (3 Dec 1979).

The use of extruded polystyrene boards applied on top of a waterproof membrane and weighted down with crushed stone is discussed as a suitable retrofitting measure for adding thermal insulation to the roofs of commercial/industrial buildings.

31253 (BFR-R—41-1983) **Heat abstraction with bottom-anchored cooling coils in stationary water. Laboratory trials.** Svensson, T.; Soerman, L.O. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1983. 62p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750852.

Heat pump systems abstracting heat from the bottom of lakes by means of plastic pipes have captured a fraction of the market. The objective of this project has been to study in more detail the mechanisms of heat absorption and freezing around a 40/32.6 mm diameter PEL pipe lying on the bottom of stationary body of water, or possibly partly covered by the bottom sediment. Measurements have been made in a 0.8 m deep pool, with water temperatures varying between 0.5 C degrees and 5 C degrees, and with a heat flux from the bottom equivalent to that normally encountered in lakes under winter conditions. The work has shown that a pipe lying on a sandy bottom can absorb heat more or less effectively as a freely supported pipe. If the water temperature exceeds +1 C degree, the pipe can absorb 40 W/m or more (about 7 W/m.K). If the water temperature drops to +0.5 C degree, the growth of ice on the pipe tends to limit the maximum rate of heat abstraction to 20-25 W/m. If the pipe is just buried flush with the sand, the rate of heat absorption falls considerably (to about 4.5 W/m.K), with further reduction as the pipe becomes more deeply buried.

31254 (BFR-R—72-1983) **Absorption heat pumps for recovery of heat from flue gases. A technical/economic assessment.** Westermark, M. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1983. 61p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750855.

The objective of this work has been to investigate suitable applications for large absorption heat pumps and to suggest suitable sites for trial installations as part of the program of research work of the Swedish Council for Building Research. The two following sites have been considered in more detail and are recommended for installations plants: - A plant in Trollhaettan, for recovery of industrial waste heat for supply to the local district heating system through heat exchangers and heat pumps. High-grade waste heat, in the form of steam, would be used as the drive energy. - A plant in Aadalen, for recovery of waste heat from water vapour in flue gases for supply to the local district heating system using heat exchanges and heat pumps. Heat from a peat-fired hot water boiler would be used as the drive energy. The report includes an investment budget and profitability calculations, together with comparisons with other alternatives. The conclusion is that both applications can be as niches in which absorption heat pumps are economically viable and fully competitive with other alternatives (e.g. mechanical heat pumps). It is therefore regarded as important to build these demonstration plants using absorption heat pumps for the applications considered.

31255 (BFR-R—75-1983) **Energy management in settlements with district heating.** Bergstroem, T.; Rosander, T. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1983. 77p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. File Number DE85750856.

The energy consumption of approximately 40000 flats has been investigated. The aim of the project was to clarify the feasibility of energy conservation by 30 percent in 10 years in district heating areas. Theoretical models have been compared with practical results. Theoretically some 22 percent should be possible to save. It has been practicable to measure the effect of various steps of energy conservation by follow-up during three years. This will give an energy conservation by 16 percent in 10 years. Together with already achieved results during 1978-1979 the calculated energy conservation will be about 28 percent. The case has been studied at Vaesteraas.

31256 (BFR-R—77-1984) **Future heating and electricity supply systems in Sweden. A study of three distinct cases from the national economic viewpoint.** Bengtsson, L.E.; Linden, B. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1984. 79p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. File Number DE85750869.

The object is to investigate theoretically and to show how the choice of different heating systems for buildings tends to influence the future electricity supply, fuel import and energy consumption in Sweden. The results indicate that surplus electric power yielded by nuclear power stations should be used for locally sited heat pumps. The method employed was to set up, on the basis of the heating requirement in Sweden, exclusive the industrial sector, and electric power production in 1981, three theoretical scenarios comprising different mixes of district heating and heat pumps. Prior to discontinuation of nuclear power production, the higher the proportion of heat pumps, the lower were the import costs for fuel and the lower the use of fossil fuels. After discontinuation of nuclear power production, when replacement for nuclear production was included, about the same amount of fossil fuel was used in all alternatives. A higher proportion of heat pumps requires higher initial investments, but is warrented by lower import costs.

31257 (BFR-R—115-1983) **Lake Vaettern as a heat source for heat pump. A regional investigation.** Svensson, T.; Broman, B. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1983. 65p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750857.

The objective of this report is to collect information that can have a bearing on the use of water from Lake Vaettern as a heat source for heat pumps. The main item concerned is temperature data, although currents, waves and bottom conditions are also important for certain types of heat collection systems. The water temperature during the winter is probably the most important parameter. At depths of 20-25 m, temperatures below +2 C degrees are encountered for about 8-9 weeks of the year on average. At a lesser depth, 0-5 m, water at this low temperature may be encountered for

11-12 weeks. During some winters, temperatures can drop to only one-tenth of a degree, or a few tenths of a degree, above freezing point in shallow water. The report describes, in general terms the technical feasibility of heat abstraction in the vicinity of a number of larger urban areas around the lake, based on bottom topography and temperature.

31258 (BFR-R—143-1982) **Lake water heating systems. Seminar of the Council for Building Research, May 1982.** Billfalk, L. (ed.). (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1982. 198p. (In Swedish). (CONF-8205296—). NTIS (US Sales Only), PC A09/MF A01. File Number DE85750858.

From Aquatic energy meeting; Aelvkarleby, Sweden (5 May 1982).

The report presents an evaluation of the applications of the systems for the extraction of heat from and for heat storage in lake water. The evaluation was accomplished in the form of a meeting where about twenty lectures were given. Case stories concerning the utilization of heat pumps for sea and lake waters were presented together with legal and environmental aspects. A list of research projects and relevant publications are included in the proceedings.

31259 (BNL—51860) **Case study of the Brookhaven House.** Jones, R.F.; Loss, W.; Dennehy, G.; Ghaffari, H.T. (Brookhaven National Lab., Upton, NY (USA)). Sep 1984. Contract AC02-76CH00016. 80p. NTIS, PC A05/MF A01; GPO Dep. File Number DE85012573.

An evaluation is made of a passive solar house with a superinsulated shell. The building was constructed in 1979 at the Brookhaven National Laboratory. A Trombe wall and a sunspace wall collect and store solar energy during the day. The temperature-energy wave travels through the mass walls and heat is released to the inside of the building about 5 hours after peak solar irradiation. The tightly insulated envelope ensures that the heat accumulated in the house is not lost to the outside. Consequently, measured auxiliary heat requirements are very low, about 25% of a comparable conventional house in the region. In summer the house performs satisfactorily. Due to storage of night coolness temperatures in the living area are well below outside temperatures for most of the day. 11 refs., 35 figs., 16 tabs.

31260 (CONF-831204—, pp 285-293) **Energy conservation in existing small commercial buildings.** Freeman, E.C. (Dept. of Energy, Washington, DC). Jun 1984. Government Institutes, Inc., 966 Hungerford Dr., No. 24, Rockville, MD 20850. File Number TI84013400.

From 2. Mid-Atlantic energy conference and exposition; Baltimore, MD, USA (6 Dec 1983).

Research has recently been completed to characterize typical small commercial buildings existing in the United States and to assess the potential of retrofit measures to reduce energy use and peak electric demand. The focus has been on commercial buildings that will be eligible under the Commercial and Apartment Conservation Service Program mandated by Congress; i.e., with annual energy consumption less than 48,000 kWh of electricity and 12,000 therms of any other fuel. The physical and energy-use characteristics of typical commercial buildings, selected from a sample of 291 buildings in 9 cities, will be described. Estimated reductions in energy use and peak electric demand will then be presented for various building retrofit options to illustrate the potential for energy conservation in this class of buildings.

31261 (DOE/BP—439) **[Summaries of FY85 research in residential energy conservation].** (USDOE Bonneville Power Administration, Portland, OR. Office of Conservation). May 1985. 44p. NTIS, PC A03/MF A01; GPO Dep. File Number DE85011782.

Technical studies, research and development projects are detailed on a number of conservation and renewable resource technologies for evaluation of their potential for electric power savings, costs, reliability, and availability. Programs cover: retrofit; new construction; state and local government assistance; consumer products and services; water heating; appliance efficiency; and environmental engineering for indoor air pollution abatement. A telephone directory is included. (PSB)

31262 (DOE/CS/22061—T1) **School and hospital energy conservation incentives.** Meyers, D.; Shrivastava, V. (Energy Resources Co., Inc., Vienna, VA (USA)). [1985]. Contract AM01-80CS22061. 23p. NTIS, PC A02/MF A01; GPO Dep. File Number DE85012094.

The success of the Institutional Conservation Program will depend on the financial, economic, and institutional characteristics of schools and hospitals insofar as these factors influence energy conserving behavior. This paper explores these factors in an attempt to assist the ICP in reaching schools and hospitals. There are serious problems in both schools and hospitals with energy-conserving capital funding. Hospitals are discouraged from borrowing for this purpose by rate base regulation which limits their capital recovery. They are also unable to generate funds internally. Schools face no active disincentives for capital improvements but face a paucity of debt funding. Schools also have no means to generate funds internally. The major implications of these and other key findings for the ICP are as follows: In funding ECM's, the ICP is paying for improvements that might not otherwise have occurred, since both schools and hospitals are capital-poor; energy price decontrol hurts hospitals and schools, but tax breaks generated by the windfall profits tax do not help them; rate base regulation discourages energy conservation in hospitals if the ICP can exert some influence on hospital rating, its effectiveness would increase; and individual schools may be information-poor with regard to energy conservation. (The ICP therefore has a role to play in publicizing and organizing information for this sector).

31263 (DOE/R8/00437—T1) **[Methacrylates to form insulation]. Final technical report.** Rasmussen, L. (Rasmussen (Laurence), Nederland, CO (USA)). 20 May 1980. Contract FG48-79R800437. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE85011342.

The use of methacrylates to form the interior foam of a transport insulation was studied. Problems encountered with the methacrylates include its low surface tension, and its slow rate of polymerization. An additional problem was an incompatability between the fluorinated surfactant molecules and the fluorocarbon gas used to blow the foam. Other experimentation involved acrylamide foams using glycerol-ethylene glycol combinations and sodium linolenate. Also investigated was the use of tin oxide coatings which are transported to visible light but reflect infrared light. (BCS)

31264 (DOE/SF/11629—T1) **Evaporative cooling workshop. Final technical report.** Mumma, S.A. (Arizona State Univ., Tempe (USA). Coll. of Architecture). 15 Jun 1982. Contract FG03-81SF11629. 64p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE85013336.

With conventional refrigeration, room air is recirculated through the refrigeration unit. The air is chilled perhaps 20 degrees or more below room temperature and then blown into the rooms at low velocity and volume. This cold air mixes with the rest of the warm air in the room - cooling it without creating strong air currents. If you happen to stand directly in an air current from the unit, it will feel cold. With evaporative cooling, a large quantity of air cooled only a few degrees below average room temperature enters the house at a high velocity. Heat is picked up from objects in the rooms, but its temperature rises only a few degrees before it is expelled outside. Since it is near average room temperature, you can tolerate turbulent air currents without feeling chilly and benefit from the increased cooling of skin evaporation and convection. Evaporative cooling costs about one-quarter of the cost of electrical air conditioning. However, evaporative cooling may not be adequate on the hottest days, especially if the humidity of the outside air is high. Equipment for evaporative cooling is described and recommendations for installation are given. (LTN)

31265 (DOT-I—84-29) **Transportation energy management: energy efficiency in transit buildings.** (Municipality of Metropolitan Seattle-METRO, WA (USA)). Jan 1984. 75p. I. File Number TI85901496.

This report identifies three types of projects which help transit managers reduce energy bills: low cost projects, moderate cost projects and high cost projects. Low cost projects have capital expenses of less than $1000 and can be expected to reduce energy bills by 10 to 15% with a payback of less than one year. Examples include setback thermostats, delamping, and replacing lights which burn out with smaller wattage lights. Low cost projects are appropriate for implementation in all transit facilities. Moderate cost projects involve capital expenditures of $1000 to 20,000, and will have paybacks of less than 5 years. They include such measures as installing local light switches, converting to high efficiency lighting, and installing waste oil heaters. The moderate cost projects should be included in any facility expansion or rehabilitation. High cost projects have capital expenses of $20,000 or more. These projects require careful analysis, but they can reduce energy bills dramatically. Examples of high cost projects include lighting dimmer systems, heat recovery equipment, internal circulation and automatic doors, radiant heating, and energy management computers. These projects are excellent candidates for inclusion in UMTA facility construction grants. 17 refs.

31266 **(DTH-LV—121) Insulation and air tightness of six low-energy houses at Hjortekaer, Denmark.** Saxhof, B.; Aasbjerg Nielsen, A. (Danmarks Tekniske Hoejskole, Lyngby. Lab. for Varmeisolering). Nov 1982. 51p. NTIS (US Sales Only), PC A04/MF A01. File Number DE85750810.

LEP, the low-energy house project, The Danish Ministry of Energy. EFP.

In 1978-1979 six detached single-family houses were built at Hjortekaer, north of Copenhagen, as six different prototype low energy houses. In this report, a few typical construction details are described, some details having been chosen to illustrate solutions to the problem of cold bridges, others to demonstrate ways of obtaining airtight constructions. The infiltration air change rate has been measured a number of times by the tracer gas decay method, showing results ranging from 0.02 to 0.12 a.c.h. Also, pressurization and depressurization tests have been made - the results of these tests and the possible correlation with the air change rate are discussed. The total heat loss is worked out from the meter readings, allowing for the solar heat gain. The transmission heat loss (ranging from approx 70 to 155 W/C) is found by deducting the infiltration heat loss (mostly less than 10% of the total), and the result is compared to the calculated heat loss, based on the actual temperatures and the theoretical U-values. The calculated and the measured transmission heat loss differ less than 15%. By means of regression analysis of the thermal calibration data three different models for heat loss equations are tested.

31267 **(DTH-LV—156) Measurement of thermal comfort and discomfort.** Lund Madsen, T. (Danmarks Tekniske Hoejskole, Lyngby. Lab. for Varmeisolering). 1978. 24p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85750801.

From 1. international indoor climate symposium; Copenhagen (Denmark) (1978).

Comfort criteria have been discussed, which by measurement, form the basis for determination of the expected thermal comfort. The disadvantages of traditional measuring instrumentation are pointed out and a better method is suggested for determination of a person's expected degree of general thermal comfort. The lack of basis for a corresponding precise evaluation of the local comfort problems due to asymmetric radiation or draught is discussed. A couple of new parameters are given which, together with the existing knowledge, is deemed to give the best possible estimation or the degree of expected thermal discomfort due to assymetry of the thermal field. Finally, a new instrument is described which can analyse thermal environments as well as measure these new parameters.

31268 **(DTH-LV—159) New thermostat for increased thermal comfort and energy saving.** Lund Madsen, T. (Danmarks Tekniske Hoejskole, Lyngby. Lab. for Varmeisolering). 1983. 10p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85750800.

From 16. international congress of refrigeration; Paris (France) (1983).

During the last ten years an immense development has taken place within the area of indoor climate control. Computers are today used to control the temperature even in small buildings. However, the result in relation to thermal comfort and energy conservation is not always as good as expected. This paper deals with some probable reasons for this difference between expected and achieved result.

31269 **(DTH-LV—160) Comparison between operative and equivalent temperature under typical indoor conditions.** Madsen, T.L.; Olesen, B.W.; Kristensen, N.K. (Danmarks Tekniske Hoejskole, Lyngby. Lab. for Varmeisolering). 1984. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE85750802.

From American Society of Heating, Refrigerating, and Air-Conditioning Engineers meeting; Atlanta (USA) (Jan 1984).

In some of the new standards for thermal environments a certain operative temperature range is given as a requirement for the thermal environment. In other standards the requirement is given as an interval for the PMV-index. This index takes the activity level, clothing, air humidity and the equivalent temperature into account. In this paper it is discussed whether the operative temperature is satisfactory or the equivalent temperature should be used as a better expression because it also takes the air velocity into account. It is shown that the use of the equivalent temperature can save energy during summer conditions but also that it can be necessary to increase the temperature during winter conditions in order to keep the thermal comfort at an acceptable level.

31270 **(FRNC-TH—1882) Study and achievement of a data transmission system using low voltage AC line for residential heating centralized control.** Conil, J.P. (Institut National des Sciences Appliquees (INSA), 69 - Villeurbanne (France)). 1982. 193p. (In French). NTIS (US Sales Only), PC A09/MF A01. File Number DE85751590.

Assembleur; GOUPIL 2; 46 refs.

The major problem of centralized control for heating occurs at the information transfer level: transmission of room temperatures to the central controller and transmission of command signals from the controller to the heating devices. The transmission medium studied consists of low voltage electrical distribution lines, or mains line. The different transmission systems on the market and choice of the best adapted are reviewed. A comparison of two media is presented: heat tube and mains line. The system constructed is then described. Results of laboratory and in situ tests are finally given.

31271 **(LBL—17001) Comparison of measured and predicted infiltration using the LBL infiltration model.** Sherman, M.H.; Modera, M.P. (Lawrence Berkeley Lab., CA (USA)). Feb 1984. Contract AC03-76SF00098. 36p. (CONF-8404147—4). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE85012549.

From ASTM symposium on measured air leakage performance of buildings; Philadelphia, PA, USA (2 Apr 1984).

The LBL infiltration model was developed in 1980; since that time many simultaneous measurements of infiltration and weather have been made allowing comparison of predictions with measured infiltration. This report presents the LBL model as it currently exists and summarizes infiltration measurements and corresponding predictions. These measurements include both long-term and short-term data taken in houses with climates ranging from the mild San Fransisco bay area to the more extreme mid-west. This data also provides a database for comparison with other infiltration models and provides a starting point for the determination of the accuracy and precision of air infiltration models. In this report we have presented the LBL infiltration model and have used field data to validate it. For short-term measurements the model predicts to within 20% for well defined environments (e.g. the MITU trailer) and slightly higher for other situations. The long-term (one week) average infiltration is accurate to 7%; in the Owens-Corning houses the long-term average error increases to up to 15%. A detailed examination of the LBL model using data from Mobile Infiltration Test Unit was used to probe the model and suggest areas for future research. 13 refs., 12 figs., 14 tabs.

31272 **(NMERDI—2-72-4618/1) Energy conservation code assessment. Volume 1. Final report.** Scheuch, K.E. (AREA, Inc., Albuquerque, NM (USA); Deringer Group, Albuquerque, NM (USA)). May 1985. 132p. NTIS, PC A07/MF A01 - NMERDI, Univ. of New Mexico, 457 Washington SE, Albuquerque, NM 87108. File Number DE85901564.

An assessment of the 1977 NM Energy Conservation Code was performed to identify changes which were cost effective in terms of life-cycle cost to the building owners. Suggestions were made to upgrade the residnetial sections of the code (apartments and multi-, single-family dwellings) to current practice (i.e., double pane windows, R-11 walls, and R-19 roof). For commercial buildings, it was recommended that a lighting power density be implemented at 2.0 Watts per square foot in office and retail structures. Implementation of the recommendations was estimated to save $4.75 million annually in utility costs over the present Code.

31273 **(NP—5750798) Comparison between the conventional and the inverted additional insulation of the flat roofs.** Christensen, G.; Prebensen, K.; Vesterloekke, M. (Cowiconsult Raadgivende Ingenioerer A/S, Virum (Denmark)). Oct 1984. 69p. (In Danish). NTIS (US Sales Only), PC A04/MF A01. File Number DE85750798.

A considerable percentage of all roofs in Denmark are flat roofs covered with roofing felt and as all other types of roof these flat roofs require periodic maintenance. In the conventional method of applying external additional insulation to flat roofs the insulating material is laid on the existing roofing felt, which then functions as vapour barrier, and then simply covered with new layers of roofing felt (the conventional roof). With the inverted roof the method of application is, as the name implies, vice versa. Here the insulation is laid on top of the existing roofing felt which, perhaps having required repair, now functions both as vapour barrier and as watertight membrane. As there is only limited experience with inverted roofs under Danish climatic conditions, it was found essential that a comparison be made between the conventional method of applying extra insulation, the conventional roof, and additional insulation applied in the form of the inverted roof. During the experiments, no substantial differences were found between thermal resistance in the conventional roofs and the inverted roofs without joints. On the basis of the tests carried out it is concluded that the inverted roof is considered suitable for Danish climatic conditions. However, calculations of thermal resistance for the inverted roof must take into consideration the reduced thermal resistance near the joints.

31274 **(NYSERDA—85-6) Research on modeling cogeneration-based residential energy systems in rowhouse and high-rise buildings. Final report.** Rodberg, L.; Jacobstein, N.; McNamara, M.; Shapiro, K.; Commoner, B. (Queens Coll., Flushing, NY (USA). Center for the Biology of Natural Systems). Sep 1984. 187p. New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223. File Number TI85901501.

A Residential Cogeneration Analysis program has been developed to describe the behavior of cogeneration-based energy systems in urban high-rise buildings and rowhouses. The Program identifies three cogeneration systems which might be installed in the user's building, operating in stand-alone, segregated-load, and utility back-up modes. Information is provided on energy consumption before and after the installation of these cogeneration systems, and a series of economic analyses is performed. Using the program, an analysis was performed of the effect of installing a cogeneration system in a 12-story, 48-unit apartment building in New York City. The most cost-effective mode of operation is the utility back-up mode, in which the cogenerator meets the base electrical and domestic hot water load of the building, with the utility grid providing additional electricity and the existing boiler meeting additional heating loads. In this mode of operation, the simple payback period is approximately two years. A conventional power plant converts only about one-third of the energy available from its fuel into electricity; the remaining two-thirds is not used, but is simply ejected into the atmosphere or nearby rivers. A cogenerator captures this heat for useful purposes, such as providing space heat or domestic hot water. As a result, a cogenerator can operate at an overall efficiency of 60% or better, compared with less than 33% for conventionally generated power. In recent years small cogeneration units suitable for use in residential buildings have become available. Such units can substantially reduce energy costs for the residents of high-rise apartment buildings or a set of adjoining rowhouses. CBNS has assembled data on all currently available cogeneration systems of capacity below 200 kilowatts, along with the heat recovery and electrical control equipment that would be used with these systems. 14 refs.

31275 **(ORNL/CON—122/R1) Buildings energy research: a bibliography.** Jordan, A.C.; Riordan, J.M. (Oak Ridge National Lab., TN (USA)). Apr 1985. Contract AC05-84OR21400. 647p. NTIS, PC A99/MF A01; GPO Dep. File Number DE85013550.

Publications of the Building Systems Division.

Buildings currently account for over one-third of the energy consumed in the United States. The Department of Energy's Building Systems Division (formerly the Buildings Division) has sponsored a variety of research programs designed to improve the energy performance of both new and existing buildings. This bibliography lists most of the documents generated from that research. Additional documents not sponsored directly by the Building Systems Division but bearing close relationships to its programs are also listed. The bibliography was created from a computerized bibliographic data base managed by the Oak Ridge National Laboratory's Conservation and Materials Group, a part of the Information Resources Organization. Abstracts and keywords are included for most of the documents. This bibliography was first published in April 1983. This updated version contains documents which have been generated since that time.

31276 **(ORNL/Sub—84-00240/1) Assessment of the energy savings potential of building foundations research.** Sterling, R.; Meixel, G.; Shen, L.; Labs, K.; Bligh, T. (Minnesota Univ., Minneapolis (USA); Undercurrent Design Research, New Haven, CT (USA); Massachusetts Inst. of Tech., Cambridge (USA)). Jan 1985. Contract AC05-84OR21400. 437p. NTIS, PC A19/MF A01; 1; GPO Dep. File Number DE85013549.

Building foundations are an important and integral part of the thermal envelope of buildings. In most buildings the proportion of the surface of a building in contact with the ground rather than the outside air is substantial. In housing this percentage may range from 45% for a one-story residence with a full basement to 25% for a two-story house with a slab on grade. For nonresidential buildings the percentage area of earth contact surfaces can also approach 45% for large one-story buildings and only becomes insignificant for large multistory buildings (without multiple basement levels). Since approximately 57% of all floor space existing in the United States is in single family detached houses and only 7% of nonresidential buildings have more than three stories, foundation heat transfer is clearly a major component of the thermal interaction of buildings with their environment. Possible energy savings for the residential building sector resulting from a change of foundation insulation from no insulation to a moderate level of slab perimeter or basement wall insulation are of the order of 0.40 to 0.46 quads or 0.5 to 0.6% of the US National Energy Consumption in 1984. The highest energy savings come from the northern and mid-state regions. The opportunity for energy conservation in building foundations is to capture as high a level as possible of the potential energy savings. This work cannot be restricted only to new construction if large savings are to be realized. About 450 refs.

31277 **(PB—85-155737/XAB) Preheat prediction models (revised).** Florez, J.; Barney, G.C. (University of Manchester Inst. of Science and Technology (UK). Control Systems Centre). May 1984. 38p. NTIS, PC E04/MF E04.

Revision of report dated January 84. See also PB84-232172.

Using semiempirically derived relationships between the time required to preheat the building before occupancy and the measured temperatures, self-tuning optimum start controllers are developed based on an adaptive predictor. Results obtained from simulations show that these controllers, and their variants, behave well and have superior performance characteristics compared with a conventional self-learning start-up controller. The controllers proposed assume no prior knowledge of the thermal characteristics of the building and are suitable for low-cost microcomputer implementation.

31278 **(PB—85-156008/XAB) Elimination of the outside influence in the prediction of optimum start control.** Florez, J.; Barney, G.C. (University of Manchester Inst. of Science and Technology (UK). Control Systems Centre). Jul 1984. 17p. NTIS, PC E03/MF E03.

Most preheat time controllers have the requirement to measure the outside temperature value for the evaluation of the optimum start time. An additional problem is that of finding the most representative location to sense the outside temperature. Simulation results presented in this paper show that when using self-tuning controllers, the outside temperature influence can be neglected without any great loss in the accuracy of the estimation of the preheat time.

31279 **(PB—85-157337/XAB) Review of development and application of heat-pump technology.** Johannsen, A. (National Mechanical Engineering Research Inst., Pretoria (South Africa). Heat Mechanics Div.). Jan 1984. 66p. (CSIR-RR—1832). NTIS, PC E04/MF E01.

North American Continent sales only.

A review is presented of the current state-of-the-art of heat-pump technology. Included is a discussion of basic heat-pump cycles, their practical implementation and the extent of the utilization of the different heat-pump systems in different countries. Trends in the current research and development of advanced heat-pump systems are also discussed. It appears that in South Africa, the most promising use of heat pumps is for water heating in medium to large installations, space heating in combination with air conditioning in commercial buildings, and heating and drying in industry. The establishment of a South African standard for testing heat pumps and launching of demonstration projects involving different heat pumps in different applications, is recommended.

31280 **(PB—85-158616/XAB) Energy-efficient residence (EER-2). Final report.** Luebs, D.F. (NAHB Research Foundation, Inc., Rockville, MD (USA)). Oct 1983. 122p. NTIS, PC A06/MF A01.

The energy-saving results are presented for the second all-electric energy-efficient residence to be built under a research and demonstration program sponsored by HUD. They show a total 1-year energy savings of more than $1,400 over that of a basic house of similar design without the extra features, with the greatest savings resulting from installation of an earth coupled heat pump and an extra insulation package. EER-2 was built in Damascus, Maryland to explore advanced measures for reducing energy consumption not now in common use but that might become practical within the next 5 to 10 years. EER-1 had shown how energy use could be reduced using conventional, readily available techniques. EER-2 was rented to a typical family and closely monitored for a full year to evaluate the effectiveness of its energy saving features. The total cost for operating the all-electric EER-2 house over the 1-year period was $657 based on a utility rate of $.053/kWh -- an average of only $54.78 a month. Of this toal cost, $115 was for heating, $55 was for cooling, $205 was for domestic water heating, $166 was for appliances, and $152 was for lighting and miscellaneous uses. The most significant savings occurred in the cost of space heating. The earth-coupled heat pump and extra insulation package, for an investment of only $4,950 combined, netted $1,121 savings in a single year.

31281 **(PB—85-158962/XAB) Production of selective optical coatings on plastic sheet. Final report.** Howson, R.P. (Commission of the European Communities, Luxembourg). [1985]. 94p. (EUR—9139-EN). NTIS, PC E05/MF E05.
